# Edgers for Medium Size Mills

Our "Star" Edger has been designed and built specially for mills of medium capacity where a first class edger is wanted, but where it would not be economical to put in one of our larger and heavier "Garland" Edgers.

The frame is all cast iron of heavy section, the mandrel is large and stiff. The Edger has a heavy press roll behind saws and the fingers in front prevent the lumber coming back. The feed rolls are corrugated and made of steel and are driven. In fact this edger is as well constructed throughout as the edgers of larger capacity. It is in no sense a portable edger, but is built for the most exacting requirements.

**Made in all sizes up to 40 inches**

*Send for Our Edger Catalogue*

# 440 Square Miles Timber Limits

on Georgian Bay

to be Sold by Private Sale in Large or Small Blocks.

On account of their President and Principal shareholders being engaged in other large enterprises, and not having the time to give to them all, THE PARRY SOUND LUMBER COMPANY, Limited, offer for Sale all of the timber lands, mills and town property situated in the Town of Parry Sound; also Tug Scow and full Camp Equipment for five camps, including boom chains, snow plows, sleighs, etc.

## THE LIMITS TO BE SOLD

comprise some 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, \$1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

## Labor Saving and Time Saving Tools

Business men everywhere are giving attention to reducing cost of manufacturing by installing labor-saving and time-saving tools.

The Shimer Cutter Heads remove many of the troubles and worries incident to the business of the machine woodworker and place in his hand the power to increase his productive capacity in the manufacture of flooring, ceiling siding, wainscoating, door and sash patterns, etc., besides saving much of the material that formerly reached the offal pile.

Examine our catalogue and see if there is not some tool you need to help in the work of cost reduction. If your work is special write us about it. Almost every week we adapt the Shimer Cutter Head to the making of Specialties, or design some new fixture to further its usefulness.

We make a number of Heads for special purposes. For any design of material you get out in quantity let us give our estimate on the Head to do the work. Our prices are uniformly low—our goods of best quality.

## The Spanish River Pulp & Paper Mills Limited

**First Mortgage 6% Sinking Fund Bonds**

Dated December 1, 1910

Due December 1, 1931

Interest Payable 1st January and 1st July

The Company has been in successful operation, at Espanola, Ontario, for five years. Its assets amount to \$13,512,184, or nearly six and one-half times the value of outstanding bonds.

The net earnings for 1911 will show from the pulp industry alone over twice the bond interest.

The Company's pulp mill is now turning out 160 tons of pulp per day, and the paper plant (which will be in operation in January) will have an output of 100 tons per day. The Company is also developing from its own waterpower 16,000 horsepower.

The close proximity of the plants of the Company to the Middle West Markets of the United States assures an increasing demand for the Company's output.

## Purchasers — And How To Locate Them

John Apsley Jenkins sells Hardwood trim. I met him yesterday, plodding along as though headed for the undertaker's. "Deucedly hard work digging up business—made nine calls to-day and not a dollar in sight" he confided.

Now, Jenkins is like nine out of every ten salesmen—spending their time making unproductive calls. They waste much time and good energy canvassing prospects that may want something, somewhere, sometime.

How can this waste effort be eliminated? How can knowledge of present and prospective markets be acquired quickly, efficiently, economically? How can this information be obtained, daily, from every town in Canada?

If you really want to know—drop us a line. Let us send you specimen reports relating to your business and explain our facilities for supplying you, daily, with information that will enable you to make sales.

## Power-Saving Rubber Belting

Goodyear Rubber Belting stands for power saved and money saved. It is built up of plies of rubberized fabric cured and vulcanized into one solid piece. It neither slips nor stretches. It has the cohesiveness of rubber with the enormous tensile strength of close woven, long fibre cotton fabric from which *all stretch has been taken out.*

Goodyear Rubber Belting is manufactured by a process that makes it proof against steam, water, weather and rot. Made in all three grades and all sizes. For Pulp, Paper, Saw Mills—all mills

where horse power transmitted is large and demand for tensile strength great. Used by biggest lumber mills and manufacturing plants in the Dominion. *Outlives, outlasts* all other belts.

## Rot-Proof Mill Fire Hose

*Goodyear Underwriters* is a hose built to meet the specifications of the Associated Factory Mutual Fire Insurance Companies. Tube used of highest grade NEW rubber. *Won't* harden or crack with age. Special circular woven fabric with least ex-

pansion or elongation under pressure. Antiseptically-treated to make it rot and mildew proof.

The strongest most reliable hose for all mills and factories. Insist on *Goodyear Underwriters, the hose with the black and yellow stripes.*

## Non-Chipping Conveyor Belts

Built for all purposes. For conveying crushed stone, grain, coal, ore, etc.

Made in all thickness of face to suit requirements of buyer. Rubber face made of toughest stock possible, to prevent cutting and

chipping. Gives longest, most enduring service.

We also manufacture other rubber goods, such as tires, all kinds of hose and belting, rubber packing, etc.

Write us tonight for catalog and prices.

## Simonds Saws

All there is to a Saw is STEEL, SKILL and STYLE.

The Steel that is in a Simonds Saw has meant that to supply it we had to build a Steel Mill comprising seven buildings which, with yards, cover 14 acres of land. This much for the demand for Simonds Steel.

The Skill that is in a Simonds Saw requires for its operation three complete factories, one at Fitchburg, Mass., one at Chicago, Ill., and one at Montreal, Que. The skill is the result of noting and accepting improvements in methods of Making Saws, as long as Saws have been made in this country.

The Style that is in a Simonds Saw comes from a close study of the style of Saws necessary for best cutting results under varying conditions. Years of experience in the Saw manufacturing business has developed an ability to select the right Saw for any particular use.

The Price that the Consumer pays for a Simonds Saw entitles him to the benefits of Simonds Steel, Skill and Style, these three together giving results or service which means profit.

If you are in the market for any kind of a Saw, Planing Knife, or file, send your order to our nearest office for our immediate attention.

## TERMS OF SUBSCRIPTION:

Canada, United States and Great Britain, \$2.00 per year in advance; other foreign countries embraced in the General Postal Union, \$3.00.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

## Yellow Pine Invasion Spreading

There has been a great deal of complaint in Canada of late about the increasing use of yellow pine in the place of Canadian woods such as white pine, red pine and hemlock. In the face of this complaint the manufacturers of yellow pine are making ever increasing inroads into the Canadian trade. The pine and hemlock men may not in future have a monopoly of the complaint against the importation of yellow pine. This ubiquitous southern product is now threatening the hardwood trade of Canada. One of the largest manufacturing firms in Canada, using great quantities of hardwoods in the production of agricultural implements is commencing to look at yellow pine and to consider seriously the use of it in the place of Canadian hardwoods. A traveller for a Canadian hardwood firm recently called upon this company to whom they have formerly sold large amounts of hardwood. When the question of ordering lumber was brought up the company's representative said that they were not inclined to pay the present prices for Canadian hardwoods and that they intended to substitute yellow pine in large quantities.

This is a contingency which the hardwood manufacturers and dealers of Canada will do well to consider. Sooner or later they will apparently be face to face with this situation and the substitution of yellow pine would involve a serious loss to them. The United States manufacturer of yellow pine will have a great advantage in that he will be able to fill orders for any size of lumber that is wanted. Altogether if yellow pine once secures a foothold in the implement trade it is practically a certainty that it will be a strong competitor. If it should be proved from experience that yellow pine will fill the bill satisfactorily the demand for it for this purpose will increase in direct proportion to the increase in the price of hardwoods at least and probably at an even greater rate on account of the well known selling methods of the yellow pine manufacturers who are willing to accept in Canada a price which does not mean

even the cost of manufacture, rather than allow their stock to accumulate and depress the United States markets.

The lumber trade in general in the United States has gone through such a period of depression of late years that the selling of yellow pine in Canada has been made a feature of the trade and has been pushed vigorously. The free entry of rough lumber into Canada has assisted in the movement and has rendered it possible for this class of lumber to be dumped into Canada at such demoralizing prices. The hardwood manufacturers of Canada in future may find that they have a common cause with the soft wood manufacturers and that in order to protect their home markets it will be essential to make a strong stand against the free importation of yellow pine. No one would claim that if our Canadian hardwoods advance so rapidly in price as to make them of prohibitive cost for such uses, it would be wise to try to exclude the substitute woods from our markets. Such an increase might come about though it is not at present probable, in spite of the case cited. If the yellow pine shows a likelihood of supplanting hardwoods, one of two things must happen. Canadian hardwoods must fall in price to meet the competition or they must advance gradually and go out of the field. In the latter case the increased prices would compensate for the lost trade after matters had settled down to the new state of trade. For the present the former is likely to be the case and the threatened invasion makes it the part of wisdom for the Canadian manufacturers of hardwood to look closely into the matter and to consider what means they can use in the direction of price competition and of energetic sales methods and judicious advertising of their products to meet the situation.

## A False Sense of Security

The publicity which, during the past few years, has been given to questions pertaining to the preservation of the forest resources of Canada has awakened a widespread interest in all matters of forest conservation. At the same time the very fact that so much has appeared in the press upon these subjects has undoubtedly lulled a large majority of the reading public into a false sense of security. When the press gives so much attention to the subject the public naturally commence to feel that the governments and all others who are responsible for the preservation of our forest resources are doing all that is necessary. So far is this from being the case however, that the Canadian Forestry Association, a body which is responsible for much of the publicity which has been given to the matter, have recently published in the Canadian Forestry Journal a strong article warning the public that, as yet, nothing has been accomplished and that in reality the country has only now arrived at the time when it is possible to begin. The article in part is as follows:

People who read in the papers these days a great deal about Conservation imagine that all is well with Canada in this respect, and that, since the watchmen are awake, they can sleep comfortably in their beds. On the contrary, if they will take up the report of the Minister or any other official in charge of the public forests, they will see that instead of there being cause for complacency the situation is actually critical. From every one of these comes the same report, that at present he is concentrating what men and means he has on the problem of fire protection, but, in spite of this, fires are constantly destroying the best timber areas. Even where the officials have for years been able to keep out fire, the cutting of the best species of trees is giving opportunity for the growth of inferior trees, so that the whole character of the forests is undergoing a steady change for the worse, and the result will be that from a timber-production standpoint they will in a few years have little or no value at all.

This is not intended to be an alarmist article, but simply to emphasize the point that, whereas the average good citizen believes that Canada is doing all that is required to protect and even increase her timber resources, the plain fact of the matter is that in this regard we are doing nothing at all. As stated before, the responsible authorities tell you they can only endeavor to pro-

fect what remains of the virgin forests from fire, and that for this they have very inadequate means. In regard to the re-stocking with valuable timber of lands for agriculture, however, there is practically nothing being done from Nova Scotia to British Columbia. There are millions of acres of lands belonging to the state which are fit for no other purpose than to grow trees. They bear no timber trees to-day and in fifty years, if present methods continue, they still will be lacking in merchantable timber. The great Miramichi fire took place in 1825; to-day after eighty-six years that once magnificent pinery has scarcely a timber tree on it, while pine has practically disappeared, not only from that district, but from the rest of New Brunswick and from large sections of Quebec. Now, if the other millions of acres of cut-over and burnt-over lands in Canada are not to be in the same useless condition at the end of another eighty-six years, then we must take warning and see that some means are adopted for stocking them with the kind of timber trees best suited for the region.

Much more is already known of proper methods of managing Canadian forests than has ever been put into practice; what is need-

ed is the chance to do what we know ought to be done. More money and more faith in the future are needed. The expense of organizing the immense forest areas of our country and of initiating the proper methods of management on them must necessarily be great. For years the forest reserves cannot reasonably be expected to return more than a fraction of the money spent on them. There can be no reasonable doubt that they will do so eventually, and the government can afford to wait that time as no private individual could.

This fact is clear from the experience of all times and of all continents that in forestry, just as in agriculture and in everything else, in order to get profits an investment must first be made. If cut-over and burnt-over areas are left to themselves they will not produce any profits from wood-crops or afford any protection to agriculture and stream-flow. If they are given a little protection they will produce a small crop of inferior wood; and if the matter be taken up in a rational way as a man would take up farming, profits will be obtained in proportion to the judgment exercised and the money expended.

## A Wide Spread Trade Trouble

Frequently of late the Canada Lumberman has drawn attention to the great number of inexperienced salesmen on the road in all parts of the country. The same condition prevails in many sections of the United States, according to an article which recently appeared in the American Lumberman and which reads as follows:—

A manufacturer of yellow pine, marketing 30,000,000 feet annually, in commenting on the conditions prevailing in the sales department remarked that one trouble with the lumber business is that we have too many salesmen on the road—not salesmen, but board peddlers. He said that formerly he had two men traveling, whereas this is all now done from a list which represents the market which calls on the dealer and all stock is now sold on this list. The manufacturer stated that he had the experience of operating on a list when he had the two men on the road and found that in making a uniform grade of lumber and giving satisfactory deliveries he gets more orders than he did when he had the men on the road.

This gentleman stated further that he did not wish to be misunderstood, but that a good salesman can always make a market, wherever he may go, but he was afraid that too many people forget what they are really out for.

Another manufacturer, in discussing selling methods, said, "We do not take an order unless we can fill it." Would-be merchants who have been selling yellow pine in times past have found it too easy to take orders and then depend upon the possibility of some one

wanting the business sufficiently to fill the orders at a cut price. Concerns have been known to carry orders for months because they could not get them filled, continually putting off the customer. All these things, of course, hurt the business.

"I would like to know," said a yellow pine man, "how anyone can manufacture No. 2 flooring and ceiling and sell it at the prices current? This means a case of using a better grade of lumber to fill the orders, and all the burden goes on the No. 1 stock. There really should not be a No. 2 grade of this stock, for in working the No. 1 there isn't enough poor workmanship and defective lumber to make any showing in No. 2. If you compare it with a like grade in boards you will see that there is a loss in manufacturing this No. 2 grade of finish and flooring. It is merely a case of waste. If you could get \$20 a ton for waste you could make money, but if your selling price is less than your labor cost, you lose money. This, of course, comes from not having a market for it, and in working up the various grades of stock you get to bothering with the waste and making regular grades of it and you have so much labor cost that it eats up any advantage you might gain in the cost of the material."

No. 2 flooring and ceiling, while practically they are sold at less than cost, would be now sold at an even lower price if it were not for the good heartedness of the dealer, who felt that he was robbing some one in buying No. 2 stock at the price at which it was being sold.

## Valuable Pulpwood Fed to the Burners

In another section of this issue appears a letter from the manager of the Bank of Montreal at Chatham, N.B., commenting favorably upon an article which was published recently in the Canada Lumberman drawing attention to the great waste involved in the destruction of slabs and trimmings in the burner, which might profitably have been converted into wood pulp. The principal point made in the letter is that there is an unreasonable lack of sympathy between the saw mill owner and the pulp mill owner. Every saw mill owner knows all about the great destruction of material which takes place in burners all over the country, but they have always considered that there was no possibility of doing anything else with the slabs and trimmings, as there was no demand for them on the spot and the cost of freight to any district where they would have value would be so great as to make this outlet unprofitable. With the increasing importance of the pulpwood and paper manufacturing industry in Canada however, the situation is more than likely to alter and to develop opportunities in many parts of the country for the profitable conversion of slabs and trimmings from the saw mill

into pulp. The lumber resources of the country are so valuable and there is such danger of scarcity, than any development of this nature should be studied with the utmost care by both saw mill and pulp mill owners and should, moreover, be welcomed by them with open arms as possibly providing a solution of one of the most serious problems of the lumber industry.

The situation reminds one very much of the conditions which prevailed in many parts of Canada in the early days, when the pioneers of the country were obliged to cut down and burn enormous quantities of timber, in order to clear the land which they intended to till. Had it been possible in some manner to preserve the timber which was thus wasted the country would have benefitted greatly in actual cash, and the scarcity of lumber which is already threatening would have been postponed by many years. This was however, a practical impossibility, whereas the situation in connection with the destruction of the slabs and trimmings of the saw mills seems to give promise of a practical solution. There are of course many districts in which there seems to be no future possi-

bility of the creation of a pulp or paper industry and in which the old burner question will probably continue to be as hopeless as ever. Wherever it is at all possible however, pulp mill owners and saw mill owners ought to lose no time in getting together and doing what they can to put an end to the waste.

That there is ample reason for making the above claims, is borne out by statistics which have been prepared by the Forestry Branch of the Department of the Interior. During the year 1910, four hundred and seventy-five thousand tons of wood pulp were produced in Canada and in their production nothing was used but logs. These logs moreover, were of species which, as our timber supply decreases, are becoming valuable for lumber and other uses. No slabs or other saw mill waste was reported as being converted

into wood pulp. In the United States on the other hand, during 1909 six per cent. of the total pulpwood consumption was from slabs and mill trimmings. A similar amount of economy if practised in Canada would have produced, from slabs and trimmings, as much pulp as from thirty-six thousand cords of wood. It is even possible to look at the matter in a still more encouraging light. Over two and a half billion feet of lumber was cut during 1910 by mills at centres of large population. With a slab waste of one-half cord to the thousand feet of lumber and a production of one-half ton of pulp, at least, from every cord of pulpwood, the slab waste at these large centres would have provided raw material for at least six hundred and twenty-five thousand tons of pulp or thirty per cent. more than the total output.

## Would Abolish Shingles and Wooden Sash

At the recent St. Paul Fire Prevention Congress, Mr. Wentworth, secretary of the National Fire Protection Association, delivered an address which, while in many respects an excellent review of current opinion, upon the question of fire prevention, went much too far in some respects. The measures he proposed are in some cases many years in advance of economical possibilities. One instance alone will illustrate this point. He would apparently abolish the use of shingles entirely, even on farms. No one now-a-days favors the use of shingles in closely built-up city districts, but to abolish them entirely would be to increase greatly the cost of building, without any corresponding benefit. Further than this, Mr. Wentworth would abolish wooden window sash and frames, in cities, and would substitute wireglass for plain glass and do a lot of other very foolish things. While Mr. Wentworth's intentions are evidently of the very best, his recommendations in the above connection would ruin an enormous industry. The loss to which would outweigh many times whatever fire loss could be contributed

to the use of wooden shingles, or wooden window sash and frames. In addition to this, such a measure would be a distinct blow to the conservation movement, which has now obtained a strong foothold in all parts of the country. Without the possibility of working up certain classes of lumber into window sash and frames, or shingles, the cost of manufacture of ordinary lumber would be considerably increased. Certain classes of lumber, moreover, which are especially suited for these classes of product would be left in the woods or manufactured into less profitable products. It is not feared by anyone that Mr. Wentworth's suggestions will be put into effect by force of law. If they ever come about they will be the result of economic conditions solely. The expression of these views, however, is an interesting indication of the tendency of the times, as it shows how seriously the public have taken to heart the lessons of the enormous fire losses which occur annually. We believe that along many other lines may be found the proper solution of the difficulties involved.

## Short Lengths for Busy Readers

The proposal to form a lumberman's club in Toronto was recently made at a meeting at which several well-known representatives of the trade were present. It is probable that definite discussion of the subject will occur at a banquet which is being planned for the middle of February. Similar clubs exist in the United States and have proved unquestionably successful. Better acquaintance is the crying need of the trade throughout Canada. A club would be a step in a good direction.

The report of the Department of Public Works of the Province of Manitoba, which has recently been issued, contains the following interesting paragraph:—"Another point to which attention is drawn is the difference between the nominal and actual dimensions of bridge timber. A strong stand should be taken against the present system of charging for a large percentage of timber which is not delivered. Many instances have been noted in which the thickness of dimension timbers has been found to be from quarter inch to half inch less than specified. This has become a custom, and no doubt has been brought about in an endeavor to lessen the cost of freight to the dealers. It is a subject which is worthy the consideration of the Union of Municipalities. To the engineer it is a source of difficulty when designing a structure, as it nullifies calculations and renders misleading the factor of safety adopted."

The United States Treasury department has issued instructions that collections of customs shall resume the collection of duties upon pulp, pulpwood, and paper, which was suspended so far as Canada was concerned, by reciprocity till last summer. The order is a general one, not confined to Canada, but applicable to all countries. It will require a legal decision to define the length of its duration.

Hon. J. G. Foster, American Consul General, at Ottawa, in discussing the charge said:—"Under Treasury instruction of July 26, 1911, entry has been given free by the United States to wood, pulp,

paper, and paper board, valued at not more than 4c. a pound, but now it is proposed to obtain an official construction of the phraseology of section 2 of the so-called reciprocity act."

It is likely that the United States Customs Court of Appeals will be obliged to settle the question of payment of duty on wood pulp, paper, and paper board imported from Canada, as President Taft and his advisers feel that there is some question whether Congress in enacting the Canadian reciprocity law intended to make the section referring to these goods operative independent of the fate of the measure.

It is likely that until further notice, American Collectors of Customs will collect the usual duty, although Hon. Mr. Foster was not sure. "They may collect duty subject to a refund," he said, "or they may let them through and make the sender give bonds to pay the duty."

Canada has several advantages over the United States in the manufacture of pulp and paper. The most important deduction from the figures lately compiled by the United States tariff board on this question is that the difference in the total cost of wood per ton of pulp is practically the difference in the labor cost. For instance, of ground wood pulp the total cost is \$14.59 for the United States and \$9.56 for Canada, a difference of \$5.03. The cost of the wood as raw material per ton of product is \$10.23 for the United States and \$5.70 for Canada, a difference of \$4.53, which, deducted from the total difference of \$5.03 leaves a difference of 50 cents per ton in favor of Canada, 44 cents of this being in the item of manufacturing labor cost. The average cost of production of newsprint in Canada is \$27.53 per ton; in the United States \$32.88. The difference is \$5.35, of which \$4.71 is accounted for by difference in cost of wood as raw material in the pulp, leaving a difference of 64 cents, 8 cents of which is covered by the difference in manufacturing labor.

# Hemlock Rules are Finally Adopted

**Western Ontario Manufacturers and Wholesalers Agree Upon Grades — May Join Canadian Lumbermen's Association**

A meeting of hemlock manufacturers and wholesalers of Ontario was held in the Queen's Hotel, Toronto, on December 27th, at which rules for the grading and inspection of hemlock were considered. These rules, which were published in a previous issue of the Canada Lumberman, had been drawn up as a provisional set of rules, by a committee specially appointed for the purpose. The idea was that the committee should draw up a list which would give the general meeting a fair basis to work upon in finally drawing up rules which should be adopted by those present and if possible become the recognized rules of the hemlock trade. The idea further was that these rules should apply only in Western Ontario, there being no suggestion that they should apply in the eastern sections of the province where odd lengths of hemlock are manufactured.

The committee had drawn up a fairly comprehensive set of rules and these were considered clause by clause by the meeting. A number of important changes were made and the rules as finally adopted by those present were as follows:—

## Rules for Grading Hemlock Lumber

### General Instructions:

The principal objects to be sought in the formulation of these Rules are:

1. To establish grades that will blend slight characteristics incident to different localities in such a manner as to produce grades of equal quality and value, and so constructed as to be best adapted to the principal purposes for which hemlock lumber can be utilized. All lumber shall be well manufactured.

2. The face side of the lumber is the side showing the best quality or appearance and the lumber shall be inspected from the best side of the piece. This clause is to apply to inch hemlock only.

3. Defects in lumber shall be distributed in proportion to the size of the piece. Wide pieces of the same grade may contain more and greater defects than narrower pieces.

In hemlock will often be found streaks or patches of red or brown discoloration sound and firm, the presence of which does not weaken the wood, nor detract seriously from its utility. Water stain should not be confused with rot, being firm and strong, while rot is soft and decayed wood.

4. All the rules herein mentioned are for lumber in the rough. Any subsequent work put thereon is to be at the purchaser's risk as to change in grade.

Inch No. 1 Hemlock: shall be 8/16 ft. long and 4-in. and up in width, not more than 15 per cent. 8 and 9 feet lengths, otherwise standard lengths. Wane is a defect, and cannot extend more than half way across the edge of piece, one inch on the surface and not more than 25 per cent. of the length. This grade shall not carry more than 10 per cent. of pieces having wane as described, shall be sound and carry some shake and sound knots.

No. 1 Dimension: will admit of shake that will not materially affect the strength of the piece. Also knots either black or red that are well located and fairly sound, or a knot or knot hole that will not impair its strength, or some slight cross checks or sound water stain. This grade, while admitting the above effects, must at the same time retain the element of strength. Lengths shall be 8 feet and up long, even lengths except 9 feet, and even widths. Wane as described in inch No. 1 shall apply in No. 1 dimension stock.

Inch No. 2: shall be known as all lumber below the grade of No. 1 excluding Dead Culls. Lengths 6 feet and up, widths 4 in. and up.

Dead Culls: shall be defined as follows: all pieces containing 50 per cent. or over of rot or other defects. Dead culls shall be 4 feet and up in length, widths 4 in. and up.

Two inch No. 2: shall be the same grade and lengths as inch No. 2, but the widths shall be 4 in. and up even widths only. Lengths 6 feet and up.

Standard Lengths: shall be 8 feet and up in even feet except in the 9 feet lengths.

After the rules had been adopted a discussion arose as to how they were to be enforced. The opinion of those present was that some well established association such as the Canadian Lumbermen's Association ought to be asked to give the rules their support.

Mr. W. J. MacBeth, of the Parry Sound Lumber Company, stated that he had been in communication with the President and Secretary of the Canadian Lumbermen's Association and he believed that if the hemlock manufacturers and wholesalers would give the Canadian Lumbermen's Association their support by becoming members, the Association would back up the rules and give them a force

which they could not secure in any other manner. The President and the Secretary of the Canadian Lumbermen's Association had also intimated to him that if the Association could have the assurance of increasing its membership to 200 it would probably be ready to reduce its annual fee from \$50 to \$25.

This statement met with much approval among the members of the meeting and those present decided to give their support to the Canadian Lumbermen's Association and expressed their readiness to become members under the conditions suggested.

An informal discussion took place regarding the importation of yellow pine into Canada and the necessity for a duty upon it for the protection of Canadian lumber. Representatives of the Ontario, Dominion and Toronto Architectural Associations had been invited to be present in order to hear the views of the lumbermen upon this subject. Unfortunately none of them appeared at the meeting.

After the discussion upon the use of yellow pine the following resolution was adopted:—

That the attention of the Prime Minister of Ontario should be forcibly drawn to the fact that United States lumber is being used in public works in Ontario, when in the great majority of cases Canadian lumber could be used with equal satisfaction, the use of foreign lumber being greatly to the detriment of the Canadian lumber industry, and should be discouraged by the Ontario Government, because a large amount of its revenue is derived from the lumber industry. It should also be pointed out strongly that Southern Pine is of an extremely inflammable nature, on account of its large amount of pitch.

The meeting was one of the most representative that has yet been held and the discussion was unusually practical and thorough, with the result that all who were in attendance felt that they had at last made a very decided step in the proper direction. The next meeting will probably be held about the middle of February.

## A Lumbermen's Club for Toronto

At the meeting of hemlock manufacturers and wholesalers of Ontario which was held in Toronto on December 27th Mr. A. E. Clark, of Edward Clark & Sons, Toronto, suggested that a lumbermen's club should be formed in Toronto. Those present took up the idea with considerable enthusiasm and it was proposed that after the next meeting of the hemlock men a banquet should be held. The banquet would enable the members of the trade in Toronto to get together and discuss a number of their mutual problems and would also enable them to discuss in detail the proposal for the formation of a club. It is probable that the suggestion for the holding of the banquet will be carried out, and that it will be held about the middle of February.

## Government Slide and Boom Report

**Saw Logs Passing through Ottawa Works Shows Increase Although Revenue Decreased—Very Little Square Timber**

The report of the Minister of Public Works, for the fiscal year ended March 31st, 1911, contains a statement of the tolls collected for timber passing through the slides and booms belonging to the Government.

In the Ottawa district the tolls charged amounted to \$40,136.34, which is \$1,507.51 less than the amount for the previous year. The number of saw logs passing through the works was 4,796,970, or 289,283 pieces more than the previous year. There were only 239 pieces of square timber taken through the slides during the fiscal year. Of the revenue accrued during the year, all but \$36.11 was collected. Of the dues which have accrued since July 1st, 1889, when the Department of Public Works took charge of the collection, there remains uncollected \$8,296.93. There also remains for this period \$56,905.65 of dues accrued, which the report states should be written off. During the fiscal year the Cheneaux Boomage question was taken up and settled. All arrears to March 31, 1909, were paid up and rate was reduced from 3c. to 2c. per thousand feet B.M., from April 1st, 1908, a settlement which was satisfactory to all concerned.

Although during the fiscal year some 289,283 more saw logs passed through the Ottawa works than in the previous fiscal year, it will be noted that the revenue accrued was \$1,167.49 less. The cause for this is found in the constant decrease in the size of the pine logs and also in the increased output of spruce for pulp to supply the two large mills at Ottawa. All such spruce, 18 inches and under, is computed by the cord or cubic contents, while all 9 inches and upwards is classed as saw logs. As very little of the spruce logs goes over 12 inches, their B.M. contents do not figure very much per piece.

In the St. Maurice district the revenue accrued was \$45,472.18, being \$1,859.84 less than in the previous year. The collections amounted to \$52,314, an increase of \$15,533.42 over the previous

year. The amount outstanding prior to July 1, 1892 remains unchanged and the report states that it ought to be written off. The number of pieces of all kinds of timber that passed through the works was equivalent to 5,439,171 pulp and saw logs, or 522,154 pieces more than in the previous year. In this district as in the Ottawa district, although the number of saw logs apparently increased, there was a decrease in the revenue. The reason for the apparent discrepancy was, that the actual number of logs brought down to Three Rivers, the rate being 2½c. per piece, was less than in the previous year, while the logs brought to Grand Mere and Shawinigan, where the rates are 1c. and 1½c. respectively, were greater than in the previous year. The increase in the quantities at the smaller rates was not sufficient to overcome the falling off at Three Rivers.

An interesting paragraph in the report is as follows:—

"In consequence of the prohibitory policy of the Quebec Government, The Gres Falls Company, which formerly shipped very large quantities of pulp wood, have in operation a pulp mill at Pointe a Magdelaine on the east side of the St. Maurice, which will in all probability be enlarged to double its present capacity. The Wayagamac Pulp and Paper Company, who purchased the Alex. Baptist business, are also erecting mills at Baptist's Island and it is generally understood that another large milling concern is looking for a convenient site for the manufacture of pulp to supply their American Paper Mills—so that, unless all signs fail, the revenue from the St. Maurice works will in all probability keep well up to, if it does not exceed, \$45,000 per annum."

In the Newcastle district the dues accrued amounted to \$1,944.70, a decrease of \$368.70. In the Saguenay district the dues accrued amounted to \$4,919.44.

A detailed statement of the timber, etc., passing through the Ottawa slides and works shows the following number of pieces:—square timber, 239; saw logs, 4,796,970; boom and dimension timber, 83,359; cedars, 71,057; railroad ties, 341,258; fence posts, 38,983; telephone poles, 73; total, 5,331,939. In addition to this, 70,332,870 cords of pulpwood passed through the works.

### May Reforest Ontario Barren Lands

The Forestry Branch of the Department of the Interior has been gathering information during the past two or three months, concerning the large, rocky, non-agricultural tract of land which lies between Perth and Peterborough, with a view to having an examination made next summer to learn what are the possibilities for the reforestation of this tract with valuable species of trees.

This investigation was prompted by information which has been collected by the Forestry Branch during the past two or three years, showing that the large manufacturing industries of Canada are now chiefly dependent upon the United States for their supply of the higher grades of timber suitable for manufacturing purposes. This tract is naturally a hardwood region, capable of producing, under good management, great quantities of valuable timber. It is expected that a full examination of the tract will be made by employees of the Forestry Branch in a few months which will show that this land is at present producing nothing and supporting a very small population; that it could, under wise management, with a reasonable expenditure of money, be reforested with valuable species of timber, and that if it were reforested it would annually produce large quantities of high grade timber, which would be of great value to the manufacturers of Ontario, and would lead to the building up of small towns and villages through the region.

The Dominion Government has large interests in this region on account of the expenditure on the Trent Valley Canal, a public work which must be more or less influenced by the deforestation of a portion of its watershed.

### Insurance Men Interested in Forest Fires

An interesting illustrated address upon the protection of forests from fire was delivered by Mr. Percy Robinson, insurance broker, Toronto, at a meeting of the Toronto Insurance Institute recently. The principal point of the address was the urgent necessity for the appointment of permanent fire rangers in the danger districts of Ontario forests, by the Provincial Government, as a first means of checking the appalling annual waste from forest fires. Graphic proof of the great damage wrought by these fires was given in the form of a series of excellent lantern slides, collected by Dr. Fernow, Dean of the Faculty of Forestry in the University of Toronto, and by the United States Forestry Department at Washington, some of the most striking pictures being those illustrative of the recent great fire at Porcupine.

Mr. Robertson showed how a great proportion of these disasters resulted from carelessness on the part of campers, and explained the method by which the spreading was checked with long furrows or ditches. He pointed out the undesirable temporary element in the present system of fire protection adopted by the Government, wherein

the great majority of the rangers were students at the universities, who applied for the work more with a view to obtaining a summer holiday in the open air than for any serious purpose, and who returned to the cities as soon as college opened in the autumn; so that the forests lacked sufficient human safeguarding during several months of the year. In many parts of the United States, it was shown, regular and permanent staffs of fire-rangers were maintained by the Federal authorities, the system in vogue in the fire zones of the Adirondack Mountains being specially efficient.

### Builders Supply Men Organizing

A meeting of dealers in builders' supplies representing the provinces of Ontario and Quebec was held in the offices of the Retail Merchants' Association of Canada at Toronto on Tuesday, December 12th, for the purpose of discussing a number of questions of interest to their trade. A Dominion Committee of the Builders' Supply Section of the Retail Merchants' Association of Canada was formed and the following officers were elected: J. Lucas, Toronto, Dominion Chairman; G. M. Webster, Montreal 1st Vice Chairman; K. Stinson, Montreal, 2nd Vice-Chairman; J. A. Beaudry, Montreal, Treasurer; E. M. Trowern, Toronto, Secretary; C. M. Moore, Toronto, auditor.

The Committee were empowered to communicate with all dealers in builders' supplies who are not already members and secure their support. Luncheon was tendered to the visiting delegates at the King Edward Hotel by the members of the Toronto Branch.

### A Rainy December in Ottawa Valley

Frequent rains and thaws increased the water flow in the Ottawa River quite noticeably during December. This increased materially the power of the pulp mills at Ottawa. Logging operations were still confined to road making and log cutting. The creeks and small rivers tributary to the Ottawa were very low during December. It was confidently expected however that after a short period of rain a freeze would occur and that the main roads would then be in excellent condition for hauling. Loghauling was not started generally in the camps till after Christmas. Reports indicate that fewer logs for local manufacturers of lumber will be taken out than was the case last winter, but there will be an increase in the cut of pulpwood.

### Cost of Making Southern Staves

In view of the frequent complaints which are heard in Canada about the competition of Southern staves, manufactured by cheap negro labor, a statement made by N. V. Turner at the National Slack Cooperage Manufacturers' Association, will be read with interest. Discussing the cost of producing staves in the South, Mr. Turner said:

"We have several mills and the best we are able to do upon a full day mill where we average 40,000 staves per day, the actual labor costs us to produce these and pile them on the yard is \$48.05, which makes \$1.20 per thousand for the labor expense. For the overhead expenses, such as manager's salary and expenses, book-keeper, stenographer, yard and jointer foreman, blacksmith, machinist, oils, repairs, feed for teams, we find the cost amounts to 57 cents per thousand; jointing twine for tying staves and splints, hauling to storage sheds and loading into cars, 78 cents; timber at \$2.50 per cord, \$2.50 making a total of \$5.05; this is less the interest upon investment and after you have your mill in running order.

We find in the South that the mould strikes our staves much more easily than in the North on account of the humidity, and on this account we are not able to get over 40 per cent No. 1 in a great many instances and 50 per cent. is about the average of six months in the year, while in the winter there are some instances where the timber will run 75 per cent. No. 1. With No. 2 gum staves at \$4 per thousand on a 50 per cent. basis and No. 1 at \$6 we find we have only \$5 for our timber and labor and expense for putting these f.o.b. cars at factory. At 25 per cent. No. 2, 75 per cent. No. 1, we find we have only \$5.50 f.o.b. for our staves. These prices are based upon the offers that are being made by the jobbers, and a great many of them have got the nerve to try to purchase No. 2 staves for less than \$4 f.o.b. mill.

Austria-Hungary, in addition to Germany, Holland, Norway and Sweden, have asked that their print paper and wood pulp be allowed under the most favored nation clause of her treaty to enter the United States free of duty under the same conditions as Canadian pulp and print paper were granted by the reciprocity laws. The question of granting this privilege to the foreign countries that have applied is to be decided soon by President Taft after he has a full report on the subject from the treasury and state departments.

## Important North Shore Saw Mills

**No. 7. The Bruce Mines Saw Mill Company—Planing Mill Products and 60,000 ft. of Good Lumber Daily**

F. H. Lawrence  
President Bruce Mines Saw Mill Co.

Bruce Mines, one of the numerous little towns along the North Shore of Lake Huron, has been noted in the past more as a mining centre than for its lumbering. To-day, however, the visitor who approaches the town by vessel, sees first of all a busy saw mill located on a point of land which stretches far out into the lake and he hears the merry sound of the saw as it makes its way through the logs. The Bruce Mines saw mill was erected in 1909 and has been turning out good lumber at the rate of about 60,000 feet a day during every day of each of the sawing seasons since that date. The annual output of the mill is about five million feet.

The limits from which the company derives its supply of logs are located on the Garden, Echo and Thessalon Rivers. They contain to-day about forty million feet of standing timber. Two camps are operated, employing about sixty men.

The equipment of the mill is modern and efficient and enables the company to manufacture lumber at a fast rate and of a quality which will compete on equal terms with any that is produced in the extensive North Shore district. The principal unit of the equipment is a single cutting band saw manufactured by the Garland Manufacturing Company of Bay City, Mich. This is supplemented by a Wickes gang saw, a set of edgers and trimmers, a lath mill, etc. The power for the mill is supplied by four boilers. These operate two engines, one of which runs the gang saw, the other running the rest of the mill.

The product of the Bruce Mines mill enjoys an excellent reputation. In the past it has been disposed of almost entirely by water shipment to United States points such as Detroit, Cleveland, Tonawanda, etc. The output, like that of most of the North Shore mills, is principally white pine.

As the company, in the past, has been dependent largely upon the markets of the United States, it has been to a considerable extent dependent also upon the financial and commercial conditions which prevail in the country across the border. During the last two or three years the lumber trade in the United States has been far from satisfactory and many of the North Shore companies have been studying the Canadian markets with a view to developing a Canadian trade. The Bruce Mines Saw Mill Company have been looking into this feature of the business for some time and last spring they decided definitely to make an attempt to secure Canadian trade. The first step in this direction was to erect a planing mill. This they did and they were able to put it in operation early last summer. In addition to the ordinary planing mill products they are turning out an excellent quality of interior finish and are

Bruce Mines Saw Mill—Bruce Mines, Ont.

having encouraging success in the marketing of these products. They are now shipping mixed cars of both rough and finished lumber throughout Ontario.

The officers of the Bruce Mines Saw Mill Company Limited, are as follows:—President, F. H. Lawrence; vice-president, A. B. Ferrier; sec.-treas., George Allyn.

### Canadian Pulp Statistics for 1910

Three processes were used to manufacture into woodpulp the six hundred thousand cords of pulpwood used in 1910. These are the mechanical or grinding process and the two chemical processes which depend upon the use of sulphite and soda. Statistics supplied by the Forestry Branch of the Department of the Interior show that wood used by the mechanical process formed over three-quarters of the total during 1910, a greater percentage than at any time in the past. Unlimited supply of clean water is a necessity in the manufacture of wood by the mechanical process so that Quebec is the province best adapted for it. Spruce furnished over four-fifths of the wood used for mechanical pulp. Balsam contributed one-sixteenth with small quantities of hemlock and poplar making up the balance. The sulphite process accounted for one-fifth of the pulpwood and was used slightly more in Ontario than in Quebec. Nearly seventy per cent. of the wood used in this process was spruce, mostly from Ontario. Balsam furnished thirty per cent., about three-quarters of which was from Quebec and the same province used a small quantity of poplar in this process. Barely two per cent. of the total amount of pulpwood was manufactured by the soda process, although Canada has the distinction of having the oldest soda mill in America. Quebec manufactured over three-quarters of the pulp made by the soda process. This process was the principal method used in the reduction of hemlock. Of the total used by the soda process spruce formed seventy per cent., hemlock seventeen per cent., and poplar ten per cent. Balsam is not adapted to the soda treatment.

Quebec leads in the mechanical pulp and Ontario produces the greatest quantity of sulphite pulp. The Ontario mills have the highest average consumption, this being 14,037 cords per mill. Quebec comes next with 13,710, and the other provinces are far behind.

The unfortunate part is the steady growth in the export of unmanufactured pulpwood. In the year under review, no less than

Bruce Mines Saw Mill Co.—One of the Camps

Bruce Mines Saw Mill Co.—Skidway Scene

943,000 cords in this state were exported, as compared with 598,000 used in Canada. Over three-fifths of the pulpwood cut in Canada was exported. It is calculated that, if this had been manufactured into pulp in Canada, the amount received for it at the average prices paid in 1910 by the United States importers of woodpulp would have been over twice as much as was received for the raw wood.

## Lumber News from Eastern Canada

### Epidemic in Lumber Camps

An epidemic which is believed to be of spinal meningitis is reported from one of the lumber camps about thirty-seven miles from Newcastle, N. B. Three deaths, and two other cases have been reported. The nature of the disease has not yet been definitely determined, but spinal meningitis is suspected. The Provincial Board of Health are taking action.

### Lumber Company's Assessment Increased

The town of Buckingham, Que., has fixed the assessment of the James MacLaren Company, pulp and lumber manufacturers of the town, at \$100,000. For the last twenty years the company has been under an assessment of \$60,000, but its plant has been considerably enlarged in the last few years. The industry is regarded as of much benefit to the town, being the chief source of employment to many of the residents.

### New Brunswick Crown Lands Receipts Increase

The report of the surveyor general's department shows that for the year ending Oct. 31st, the crown lands of New Brunswick yielded in revenue the sum of \$529,823.82. This is a considerable increase over the figures for 1910, and makes a new record. The largest items were:—Stumpage, \$367,641.02; timber licenses, \$81,206.00; game licenses, \$38,672.17; fishing, 15,610.00; mining, \$6,233.48; royalties, \$6,495.65.

It will thus be seen that in its very large area of crown lands the province possesses an asset of very great value. Because of a reduced lumber cut the receipts from stumpage for the next year will not be so large.

### Wayagamack Plant Progressing Rapidly

The Wayagamack Pulp & Paper Company are making good progress with the erection of their plant on Baptist Island, at the junction of the St. Lawrence and St. Maurice Rivers. The estimated cost of the proposed plant is more than one-and-a-half million dollars. When completed the plant will have a capacity of 200 tons a day. Over 2000 hands will be employed. In preparation for the opening of the plant the company's mills are now sawing 10,000 logs a day. The company's supplies of raw material are almost inexhaustible. They own 1121 square miles of the finest spruce and pine land in the valley of the St. Maurice. A conservative estimate of the resources places the timber now available at 4,072,000,000 square feet. With the St. Lawrence at their door and the C. P. R. passing by on the mainland, they have splendid facilities for shipping their products.

### Wood Pulp Production in 1910

Nearly 600,000 cords of wood were ground into pulp by fifty-two mills operating in Canada in 1910, according to the statistics of the forestry branch of the Government. The value of the wood was \$3,585,000. It made 475,000 tons of pulp.

Because of its extensive spruce and balsam forests Quebec produced more pulp wood than any of the other provinces. Twenty-five Quebec pulp mills reported the consumption of 57 per cent. of the wood produced in Canada, or 23,000 cords more than the year before. The fifteen pulp mills in Ontario consumed one-third of the total, showing a gain of 20,000 cords over 1909. Nova Scotia mills used 30,000 cords, but New Brunswick fell to one-fifth of the previous year, and consumed only two per cent. of the total. The cause of this was the closing of one large plant.

Six dollars per cord was the average value of pulp wood in Canada in 1910. The lowest prices was in Nova Scotia, where \$4.65 was the cheapest. In Quebec alone the figure dropped below the 1909 rate. The drop was 35 per cord, bringing the average down to \$5.50. The average in Ontario was \$7 per cord.

Though official returns are not complete for the season of 1911, it is believed that the manufacture of pulp was greatly hindered by low water at some of the biggest points of production. On the other hand, there was a large expansion in manufacturing plants.

### Montreal Exports Show Decrease for 1911

The following is the annual statement of shipments of wood goods from the port of Montreal during the season 1911, with comparisons for two previous years:

	1910 Ft. B.M.	1909 Ft. B.M.
Watson & Todd ... ..	30,663,444	34,684,863
R. Cox & Company ... ..	13,296,102	20,181,398
W. & J. Sharples ... ..	10,222,326	11,014,202
J. Burstall & Company ... ..	9,334,797	10,501,571
E. M. Nicholson ... ..	9,134,954	8,659,361
E. H. Lemay ... ..	7,208,343	8,341,101
Dobell, Becket & Company ... ..	4,930,711	3,640,841
Cox, Long & Company ... ..	2,431,104	2,448,189
Graddon & Owens ... ..	.....	1,526,197
Railways, steamship lines and small shippers.. ..	16,251,439	16,883,870
Total ... ..	103,473,220	117,881,593
Shipments, 1910, ft. B.M. ....	.....	117,881,593
Shipments, 1911, ft. B.M. ....	.....	103,473,220

Decrease, 1911, ft. B.M. .... 14,408,373

Almost without exception, the principal shippers have done a smaller business, due no doubt, to a certain extent, to the great British strikes, which held up exports for some time and materially interfered with business even when the trouble was settled. But the greatest factor has been the keen competition of Baltic timber, which is laid down in Great Britain and Europe at lower prices than Canadian products.

### Lumber Waste for Pulpwood

Chatham, N.B., Dec. 12, 1911.

Editor, Canada Lumberman:

I was glad to see in your edition of 1st inst., the short article on "Lumber Waste for Pulpwood," and I trust you will find it possible to continue referring to this question until both our saw mill and pulp mill owners will see that it is to their mutual interest that slabs should go to the pulp mills instead of to the fire.

At present I do not find that there is much sympathy between the saw mill owner and the pulp manufacturer, and if we can overcome this by showing that the more complete use of the logs will tend towards the lessening of the annual cut and the extension of the life of our forests, it should appeal to the saw mill owner more effectually than anything else.

Unfortunately the pulp business is a much more recent one than the saw miller's and it seems difficult to make the latter depart from his old time method of consigning to the flames all the wood that he cannot turn into deals, boards or laths and it may take a good deal of education to change these old methods; but it will be a good thing if you can help to bring it about and I wish you all success.

Yours truly,

W. DICK,

Manager, Bank of Montreal.

### Free Lumber will be Advocated in Congress

In the course of a letter to the "Timberman," Mr. Leonard Bronson, manager of the National Lumber Manufacturers' Association, writes as follows:

"Undoubtedly during the next session of Congress an attempt will be made to put lumber upon the free list and it looks as though it might be successful, for, while the majority of both the House and the Senate take no stock in the talk of the 'lumber trust,' yet the pressure behind them is likely to be so strong that they may yield to public clamor. Therefore, all the consequences of reciprocity that we have gone through are likely to be felt in an accentuated degree, so far as lumber is concerned, a year from now.

Every argument that appeals to lumbermen, either in the line of business or as citizens, is against putting lumber on the free list; yet many lumbermen feel that if they consent to that action the clamor against them will be quieted.

It is a pity that this question cannot be settled on its merits and that the public cannot come to such an understanding of the facts regarding the lumber business that they will not demand free lumber simply as a reprisal for an imagined wrong. If the Department of Justice could hurry its investigations and its suits to a conclusion it might not yet be too late for the people to learn where blame lies and what their interest in the matter is."

The Board of Trustees of the National Wholesale Lumber Dealers' Association, have decided to hold the annual meeting at Louisville, Ky., Wednesday and Thursday, March the 6th and 7th.

# The Band Saw

Second Article of Series Specially  
Written for the Canada Lum-  
berman by Hapsburg Liebe.

## Leveling and Tensioning

Together with the back, this is the body of band saw work, the keystone. The degree of the filer's competence is largely dependent upon his ability to level and tension and put up his backs correctly, which means, in addition to the accepted sense, with a view to existing conditions. If one can do this major part of band saw fitting as it should be done, the other work, he will find, will be a matter of little trouble.

There are so many ways of doing this part of band fitting, that one naturally feels a bit queer in attempting to lay before a host of readers with minds of their own the methods that have appealed to him as being best. In this, I shall tell of the ways that I found most successful in the actual work of filing. There is no theory about them; it all came from practice. However, these methods never lost me a place.

Anyone may take a blade, of any width or thickness, and pound it to an uncertain degree of fitness; anyone may put the roll down so hard in the central parts that the blade shows—superficially—a tension clean across the plate, from edge to edge. But, needless to say, saws put up in such a manner will fall short of giving satisfactory results. When going to the bench, prepare to work judiciously, painstakingly, honestly, beginning filer. Sometimes even this is hardly sufficient, it seems; for hard lines have a way of coming to us all, now and then, no matter how much experience we have had.

When working a saw that has made only its usual runs, say four of three hours each, a saw that has met with no accident, such as being unduly stretched by heat from a sliver in the guide, jerked by a loose or falling knot, or chopped heavily by a careless sawyer, I put into use a kind of system. It is simple, and it gets out all undesirable features if one is careful.

Now, while I do not generally advise rolling all the way around the band to restore lost tension and fill out the back, unless the saw is uncommonly drawn, or unless the filer is a man of fair experience, I have resorted to this method as a sort of preliminary to the benching of a saw. And I wish to go further and say that the beginner should be cautious about this, or he will find himself in deep water because of too full or too hollow a back, too much or too little tension, or, perhaps, a dished saw all the way around—the latter as a result of the saw running downward to the bend as it leaves the roll. When I do this preliminary stunt, I begin on the back, with the roll pressed down very moderately, and roll up to the front tire, or vice versa—although I prefer the back edge as a starter, I believe. The proper width of tire for ordinary practice, according to my reasoning, should be about 1 inch in a 10-inch saw, 1½ inches in a 12-inch saw, and a like degree on other widths of blade. This, however, is a question that must depend to an extent upon the thickness of the saw.

Having done this rolling mentioned above, I go around the blade and level short sections here and there in order that I may try the crown and tension. If it is fairly good, I stop the all-the-way-around business and go ahead with the sectional work.

And this is my method of doing that, once I have stretched the saw in the manner before mentioned—or, as well, when I have not done the all-the-way-around preliminary rolling:

## Sectional Leveling

I begin with the blade outside, or log side, up. The first thing, I am sure that there is no gum or dust sticking to the inside, or wheel side, of the saw. The latter is important, as the least bit of dust or gum between the saw and the leveling block will cause one to think there is a lump or ridge that needs hammering out. I am careful to have but little more of the teeth than the swaged point off the block; this, too, is a matter of importance, and the why is too evident to need explanation here. I use a handy weight on either end of the leveling block—whether I carry too much tension to allow the blade to flatten of its own weight or not, because I am sure that the plate is down firmly then. These weights I make of babbit metal, with three legs—nails—set in them while the metal is in a molten state, this type of weight being good because one may see right under it when looking under the straightedge.

In the first of my leveling, I go over the outside, or log side, with the straightedge held lengthwise of the saw, which will locate the lumps and ridges that run crosswise. I do not bother to mark off sections in this; and it is not necessary, as the weights tell

me where I am to work. I go clean around the saw leveling in this fashion, with the straightedge held only the one way, lengthwise.

This done to a nicety, I put the saw on the brackets overhead, and go over it on the inside, or wheel side, with the straightedge held lengthwise, just as I did on the other side. Then I turn the straightedge, and go over the inside of the saw with the straightedge held crosswise. Every tooth is examined closely, and every ridge and lump is hammered out. Following this, I let the saw down, as it was in the beginning, and go over the outside with the straightedge held crosswise. This should make the blade perfectly level. One had handled but one class of devilment at a time, and he has been, in a measure, enabled to specialize minutely.

## Tensioning

Now comes the tensioning. One will usually find, especially if he has not rolled the blade all the way around at the outset, that the front edge shows tight for a few inches inward; and, in case one does not carry crown in his backs, sometimes the back edge also is stiff for a few inches toward the centre. I mark off a section, say 2½ feet in length—I use chalk here, as the weights will not be in place when I test for tension. Again, I level this section with the straightedge held crosswise the saw, to make sure it is right: for the saw may have turned outward a bit by going around the two bends, or I have overlooked a little ridge or lump before. Finding it good, I raise the blade with my right hand and drop the tension gage with my left. If there is the usual drawn front edge, I roll three or four times, gently, carefully, beginning at the tire and going toward the middle. Then I test with the tension gage. If it looks alright, I pass that section along, and go after another one the same way. If my roll has the slightest tendency to dish, I try with the straightedge after tensioning, to make sure. One must be sure, you know. Thus I go all the way around the blade.

Here comes the chief devilment, the thing that thwarts and tangles the young filer, the thing that causes the band saw to make bull-heads, crooked lines, to crack, to vibrate—and do too many other wicked tricks for enumeration here. This is false tension; that is, a condition of the plate that makes it appear to be tensioned—to the inexperienced eye—but is really nothing.

One may take a blade that is perfectly flat, a blade that has no tension at all, and roll it continually in the very centre only until the whole width of plate will drop away below the curved gage. This is because the looseness of the extreme middle, the one narrow place that has been stretched, must fall downward to relieve the excessive length; and in order that it may do that, it must pull the front and back quarters down with it. Is it clear? Of course, I grant that this condition is never found in such an advanced degree; I have but used it as an illustration.

Ordinarily, the young filer is mortally afraid of cracks; in fact, he is so afraid of fracture that he will hardly recognize the truth that a bandsaw must be on the verge of breakage to do its best. He is, therefore, fearful of going too near the edge with his tension, preferring to favor the middle a great deal. And in favoring the middle he brings down the parts under the tires by force of the drop of the middle, and it looks like tension—and he lets it go at that. The result is undue stiffness under the tires; the result of undue stiffness under the tires frequently evolves into a man looking for new fields of operation.

## Testing for Tire

To test positively the width of tire, hold the saw up from the leveling block with one hand under it, with the looseness of the centre pushed upward, and rock the straightedge—not the tension gage—over it. A flat place, the saw being level, understand—is a tight place: the place that will not curve upward, the reverse of the sag downward, needs stretching. Is it clear, young filer? Young filer, when I learned the thing set forth in this paragraph, I regarded it as worth a thousand dollars to me. It is an infallible test; one may tell exactly how much tire he has. And usually he has much more tire than he would have been willing to believe. The tire, of course, will show flat.

I remember an incident that I believe should be related in this connection. I was called one day over to a small mill that had a very green filer. They wanted to see if I could tell them just what was the cause of the dogged tendency the saws had toward nosing out of the log on entering. They had lined the mill, the

track, the blocks; they had worked on the offset; they had done everything—and had put it up to the filer to show the goods. The filer was working like a Trojan, doing all he knew. His saws were buckling with over-tensioning, dropping away below the gage. Upon applying the straightedge on the upward test, we found that there were tires almost to the fourth of the saw, each way. Almost half the saw was stiff. The tension was all in the centre.

One trouble connected to the stiff edge—the front, generally—is that one is sometimes a bit backward about rolling clean up to his tire because it lets the other edge in for a lot of straightening. But this is the principal thing that makes the steel ribbon go, men, this business of working lots. If the back is affected by rolling to within an inch of the front, it is because the extreme front is in a very bad condition.

And there is another fault found in the inexperienced filer. He sometimes doesn't try to see how well he can put up a saw; instead, he wants to see how quickly it may be done. Instead of rolling four lines carefully and lightly, spreading his stretching, he will force the lever around hard, and bring the saw below the gage at a single line. It is a thing too valuable to forget—to put as many roll lines as is consistently possible on the tight places.

It is not a good idea to use a tension gage that is too lightly curved and try to atone for it by allowing light between the gage and the saw. One's eyes cannot detect the irregularities unless by the edge of the gage. Use a gage of the proper curvature, and allow little, if any, light to show. If this is done, the upward straightedge test is not so necessary.

#### How Much Tension?

Opinions differ, as is but natural in all mundane things, as to the correct amount of tension. An old rule is to use as much as the saw will take and lie flat on the leveling block of its own weight. And it is a good rule under favorable conditions; this point, however, is one that demands the judgment of the filer. In some cases, I have found that a tension a little deeper than the flattening-of-itself tension has helped. These cases were wheels badly worn, or wheels too heavily crowned, or, at least in one instance, a mill whose owners demanded a great output at the expense of the saws. But there is a stopping place to this. If a saw has so much tension that it cannot be properly leveled, even with the use of heavy weights, how can one put in the tension evenly? The dire results of uneven tension are too well known to need any comment whatever from me.

There is a difference in mills, it seems, though all may be in good condition. I filed one double mill, the wheels of which were never allowed to wear badly, that did better work with a slightly heavier tension in the front quarter than in any other part of the blade. These saws, I may mention, were especially thin, and ran in large oak logs almost exclusively. This was an instance of the filer adjusting himself to conditions—begging pardon for the inference. And the filers who can readily step out of a rut for the betterment of all concerned usually hold positions well.

Now as to the different methods of applying the tension gage. I have seen successful filers who invariably used a heavy pressure on the gage when testing for tension; also I have seen other successful filers who tested only with the natural drop, or sag. There is much difference of opinion here. A highly reputed sawmaker once wrote me that to bear down hard on the gage would exaggerate the condition of the plate. One thing I can say I believe: that if one uses a pressure he should watch the edges, that is, the parts just under the tires, because they are apt to get tight on account of the tendency to roll in the centre, which is prone to come up under pressure. I knew one successful filer who tensioned first with a lightly curved gage under hard pressure; then went over the saw again, this time with a gage of a much deeper curvature, adjusting the tension by the natural drop.

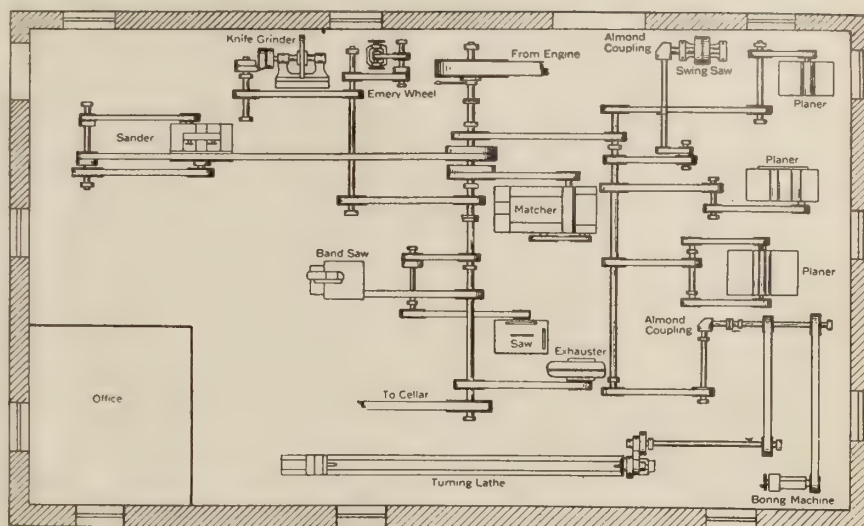

However, in this the paramount idea is to have the saws take the feed. No matter what methods one employs to get the desired result, as, in this, "all roads lead to Rome."

#### ✓ A Modern Planing Mill ✓

By W. H. Wakeman

The illustration shows the location of machinery in a small but well-equipped mill, not far from my engine room, that is giving excellent satisfaction in daily operation. The building is about 35 x 90 ft., and is located directly on the corner of two very busy streets. It is composed almost wholly of brick, reinforced concrete and iron, hence is nearly fireproof; but its contents might easily take fire and injure the machinery. It would be impossible to burn the building. It is two storeys high, but one of them is below the sidewalk.

The floor on which the machinery stands is about 3 ft. above the street level, hence rough material is unloaded from wagons and the finished product is loaded about on a level surface. No descrip-

Plan of an Efficient Small Planing Mill

tion of these machines is necessary, as each one is plainly lettered.

While the first storey of this mill is below the sidewalk, it is directly on a level with a large lumber yard, hence one side and one end are practically above ground and it does not appear like a cellar or basement.

The power department is located here, and is well lighted and ventilated. It consists of a 90-h.p. gas engine and a gas producer. All the machinery shown in the illustration, also the engine and producer, is in charge of a first-class planing mill mechanic and engineer. A good laborer fires the producer and does other work about the mill. The shavings are baled and sold for bedding horses, also for filling icehouses, etc. Waste wood is sawed and sold for kindling. Sawdust is put into barrels and delivered to stores, etc., to spread on the floors. The income from this source pays the expenses of preparing all material for market, also of firing the producer and caring for the engine, which is nearly as reliable as a steam engine.

Pea coal, costing about \$4 per gross ton, is burned, and two tons of it lasts from eight to fourteen days, according to the load carried; the average is about ten days. The expense of operating this plant, and the result secured from the entire general arrangement and management, will compare favorably with any other mill, and is far superior to many that might be mentioned.—The Woodworker.

## Fitting Band Saws for Winter

Methods of Tensioning, Rolling, Leveling, etc., for Use in Frozen Timber—Pointers for Filers

By E. L. Mason

For the frozen timber I do not make any radical changes in the saw-filing. My saws will stand a little more tension, and a little deeper on the tooth edge, in frozen timber than in soft timber. This, I think, is caused by the harder timber warming the tooth edge a trifle more than the soft timber does. I have noticed that a saw will stand considerable more tension in hard timber of any kind than it will in soft timber, without cracking. I have had equal success by running the roll around the saw  $\frac{1}{2}$  in. from the tooth edge, or even  $\frac{3}{4}$  in. from it; the latter may not at all times stand quite so much feed, but it will hold the tension considerably longer than the closer rolling will.

On a 14-in. saw I use a 50-ft. tension, with the gage 12 in. long, and use half the gage at a time, by pushing it out past the teeth until the end comes in the center of the saw, then roll that half until light shows under it half way from edge to center; then when this edge suits me, I do the same way with the back half of the saw. When I get the edges right I then use the gage clear across and roll the center part of the saw until the gage does not rock over the center—until the center drops enough to fit the gage. With this kind of tension the saw will lie perfectly flat on the bench, so I call it flat tension.

With a 12-in. saw I use the same gage, but roll the edges just to fit it, and then roll the center until light shows under the middle portions of the saw. For any saw under 12 in. wide I either use a 40-gage or roll more drop to the center. I also have had the best of luck for saws under 13 in. by taking a 50-ft. gage and then filing off a little on the tooth edge; or, rather, filing the tooth half of the gage to a 40-gage, so that in using this gage I surely get tension in the third part of the saw near the teeth, where the most of the tension is needed. Of course, this kind of a gage must be stamped on one edge with some kind of a mark, to distinguish one end from the other when in use, so as to be sure and not get the most tension

in the back, as too much tension in the back half of a saw will crack it, for the back of a saw seldom gets warm from cutting, as the tooth edge does.

If I am in doubt where to run the roll on short places, or if it does not drop from the rolling as I think it should drop, I bear down hard on the tension gage with one hand and lift with the other. This causes the place to be rolled to rise, so that the gage will rock over it. Another way to test for small spots, that I often use on wide saws, is to hold a straightedge straight across the end of the saw as it lies on the bench, and mark with chalk all the small or large places that show light under the straightedge. This is a better way for some filers, as the weight of the saw bears down more regularly on the end than they can bear down on the gage; also, this gives the same result that is gained by raising the saw by hand and rocking a straightedge over it to find the flat places. I can seldom raise a saw the same height each time by hand, so prefer the end test.

After I get all the little places tensioned that I can, and still have the saw lie perfectly flat and stiff on the bench, I level it up as nearly flat as possible, taking some pains to see that the 3-in. strip along the tooth edge is flat and smooth, as this is the part of the saw that guides it in the cut; and the straighter I get this part, and the better it is tensioned, the better the saw cuts frozen timber, especially maple, hickory, birch and like woods.

If a saw needs much rolling, I roll it around the whole length 2 in. apart. If this is not enough, I roll between these roll marks, and, if necessary, between each of these again. In this way it is hard to miss getting tension all over the saw. But I always go over it in sections afterwards, to see that it is even, as some parts of the blade may be harder than other parts, although I have often run them, when in a hurry for a saw, and they have never failed to run well. Still, they might crack from being uneven.

If my saws draw ahead in the cut, I think my tension is alike in both sides of the saw, but if it runs back—crowds back in cut—I think it hasn't tension enough in the tooth edge. If I get enough tension in the tooth half, my saws do not move on the wheels in a hard cut or a soft one, but stay right in place, just the teeth clearing the wheels, although one sawyer here runs them off about  $\frac{3}{4}$  in. A saw with a long back—more than  $\frac{1}{32}$  in. in 5 ft.—will not run as far back on the wheels, and stay, as a saw with less than that much back.

I run a nearly straight back, just enough to feel a straight-edge rock across it, about  $\frac{1}{64}$  in. in 5 ft., but I have run saws that had been in accidents, with a back  $\frac{3}{16}$  in. in 5 ft. They, however, had to run ahead on the wheels about  $1\frac{1}{2}$  in. These extreme backs were 14 in. saws that had been caught on the back edge with a slab in gidding. I would advise not more than  $\frac{1}{32}$  in. in 5 ft. in any saw, wide or narrow, and prefer less in my own saws.

If you have hard sawing to do, it is best to level both sides of the saw, as the roll may dish it some; the more pressure I put on the roll, the more I find it will dish the plate, the way it will dish depending on which way the part rolled was dished before rolling it. Hard rolling over a section that is dished in the log, is quite apt to dish it much more into the log. After I get a saw tensioned and level, I let it run, usually about a week, instead of tinkering with it every time it comes off. When four mills change saws every half day, I cannot bother about looking them over every time they come off; and, besides, I find a saw will run better the second run than the first, after tensioning.

For winter sawing I can run a little less swage than in summer, if the logs are fairly clean, but I pay more attention to the shape and sharpness of the corners than to the gage of swage. I want the corners all out sharp, even if there are teeth that, through striking iron or stones, are as much as  $\frac{3}{8}$ -in. short. I swage them out evenly, if I have to file them out with a round file in order for the swage to get hold of them; and if the swage does not bring out the point, I use an upset on them. With all corners out full width, and sharp, a saw will not mark the lumber if it has several short teeth. I have also put in pieces that were  $\frac{1}{4}$ -in. narrower than the rest of the saw, and by gradually lowering the points behind the low places, and swaging them full, they did not mark or chop. Of course, these are extreme cases, and I had much rather have all the teeth the same length, so I believe in putting all extra time on the teeth instead of on the bench.

In swaging, I try to have the swage pull the points ahead enough so that when the tooth is ground up, the back is ground as much as the face. And I am particular to see that the shaper jaws do not get worn hollow, but are flat and will push the sides of the swaging ahead enough so the grinder grinds the shaping as well as the extreme points, leaving a sort of three-cornered hollow under the tooth. That leaves the shaping smoother, and, I think, sharper, than if just the points touch the emery wheel. I use between 9 and 8-gage swage, unless compelled to use more in order to get sharp-pointed corners through sawing mud or stone. I take pains, also, to see that both sides of the corners are alike, not one side

with more swage than the other side, also that the grinder grinds squarely, as I believe in straight work, on the bench, in the fitting, in the lining up and in the guiding.

With my saw properly tensioned and leveled flat, with square-fitted teeth, and all corners sharp and full width, I call my saw ready to go on the mill. The mill I line up straight with the track, no lead either way, and no cross-line. An easy way to do this is to have a straightedge 16 ft. long. Clamp this on the headblocks with small clamps, so when the carriage is run past the saw it will be 2 in. or 3 in. from the saw. Run the front end up to the side of the saw and measure how far from the saw it is, then run the carriage ahead to the other end of the straightedge and set that end exactly as far from the side of the saw as the other end is. I measure about 1 in. from the teeth, and in the same place, on each end, so as to be sure the straightedge is equidistant from the saw at each end. Now run the carriage back until the center of the straightedge is opposite the opening in the husk, where the saw goes down to the wheel, and clamp another straightedge on the other one and across the husk, keeping it level with the one on the carriage, and square it with that one.

There are so many ways to square two straightedges that you can take your pick. Use the way that is quickest and easiest for you, but be sure and get them squared. An ordinary square is hardly close enough, although I have used one often when in a hurry. Otherwise I use a stick, and measure equal distance each side, and square from these marks to a mark on the other straightedge. After these are squared it is easy to tie two lines to the straightedge that passes over the saw line or husk, and measure from these lines to the wheel. I set each wheel square with this straightedge, so that the wheels are exactly in line with the track. This method is much quicker than it sounds, and is quite correct if properly done.

I have often lined up mills by just twisting the wheels to where the saws ran alright, and let them alone until I had time to put lines on them, and seldom found them far wrong. If a saw is "bull-heading," it is safe to say the mill is out of the log—providing you know the saw is right—while if it is in too much, it will surely crack. It will be no uncertain crack, either—usually so large as to mean a braze at once. I have known of good filers lining their mills a little out of the log for winter sawing; also, I have known of many more that swaged a trifle out for frosty timber or hardwoods. I do not like this way, as I believe if you want a saw to run straight, everything that has anything to do with this saw should be straight, and not try to have the saw go one way and the sewage, or leveling, or lining, or guiding trying to pull it another way. If you want a saw to go straight, get everything straight, even straight-faced wheels—or flat, as they are called. A straight-faced wheel is easier to make than a crown wheel, and it is much easier to get two of them alike, than a crown, for without a special machine it is hard to crown two wheels alike. In grinding or turning wheels flat, it is easier to line them up and get the saw to hang straight with the track when standing still.

I know filers that grind a saw up nearly sharp, then file the underside of the teeth until they have a face from  $\frac{1}{16}$  to  $\frac{1}{8}$  in. with about half the hook—and some of them less—so the point is chisel-shaped. They claim good results in frozen timber and hardwoods. I do not recommend it; too much work and a hard-running saw. I want all the hook I can get, and have a strong tooth, no matter what kind of timber I am cutting, but I know of saws running with this tooth and doing good work. The shape of the teeth shown herewith is drawn from the saws. They do not look so smooth as teeth drawn from imagination, but they are the ones we use on everything more than 10 in. wide, and have been shortened down some for winter sawing; the  $1\frac{3}{4}$ -in. teeth are better for summer sawing, and the 2-in. space is better for winter or hardwood, if the speed is the same. If the speed can be slowed down to 8,500 ft. for hardwood or 9,000 ft. for frozen hemlock, the  $1\frac{3}{4}$ -in. space is just as good for winter, but if the speed is stationary—as it is here—the 2-in. space is best for winter sawing of any kind. Our log saws and 12-in. resaws are interchangeable—use any saw on any of the three mills, all being 45-ft. in length and same fitting. The little saws are only 36-ft. long, so can only be run on their own mill.—The Wood-Worker.

### South American Paper Trade Opening

Canadian interest in the Latin-American republics has received official stimulus by the appointment of trade agents in Argentina, Brazil, Venezuela and Colombia. Commissioner Pousette in his first report from Argentina mentions printing paper as one of the commodities in which Canadians might extend their export trade with that country. In order to capture the trade he advises Canadian firms to carefully study the Latin character. He suggests that a native of the country, trained in the business, could handle the foreign trade best, as it is advisable to approach the Latin merchants in their own language and in methods with which they are familiar.

### To Put an End to Log Piracy

A bill has been introduced in the House of Commons by Mr. Stevens, which has for its object the prevention of the stealing of logs which has been the cause of much loss to loggers on the Pacific Coast of British Columbia. The bill proposes to make it a criminal offence to steal such logs, and the penalty provided is liability to three years' imprisonment. According to the bill, everyone is guilty of an indictable offence and liable to the above penalty, who, without the consent of the owner thereof, and without lawful excuse (the proof whereof shall lie upon the person charged) takes, receives, purchases or sells or causes to be taken, received, purchased or sold, any timber, mast, spar, sawlog, shingle bolt, or other description of lumber bearing the owner's mark, which is found adrift in, or cast ashore on, the bank or beach of any river, stream or lake, in Canada, or in the harbors, or any of the coast waters of British Columbia. A similar penalty is provided for anyone who, wholly or partially, defaces or alters the mark or number on any such timber or lumber, or who refuses to deliver up to the proper owner thereof any such timber or lumber. In any prosecution or trial for an offence under this act it is provided that a timber mark duly registered under the provisions of the Timber Marking Act, chapter 72 of the Revised Statutes, 1906, or the Timber Mark Act, chapter 184 of the Revised Statutes of British Columbia 1897, shall be prima facie evidence that the timber is the property of the registered owner of such mark. Possession of timber so marked shall throw upon the accused the burden of proving that he came lawfully into its possession. The object aimed at in the proposed bill is to bring the practice of log stealing under the Criminal Code. In most parts of the country this is already the case, but on the coast of British Columbia the matter has been one for settlement in the civil courts only, and it has been found to be practically an impossibility to put down the log pirates who have a lucrative business of collecting other people's logs.

### Lumber Stocks at Victoria Reported Short

Victoria, B. C., reports state that a number of the carpenters of the city are idle, and are being held up for material on account of the shortage of lumber. The local mills are not able to meet the demands made upon them by the contractors, and the introduction of finished material, such as sash and doors from the American side is on the increase. The American manufacturers, most of them employing white labor, are able to meet the duty, and still undersell in the Canadian market. The building development of the district, according to the reports, has undoubtedly been crippled by the lack of cheap lumber, and it is a significant fact that one of the largest buildings now in course of construction has been built almost entirely of American lumber on account of the difficulty of securing such material. The shortage of orders, owing to the slump in building operations on the Washington side, has made the American lumbermen more keen to get into the British Columbia market. Since the new tariff regulations, extending the discretionary powers of customs officials in defining what is manufactured lumber, were issued, it is likely that the importations will be affected somewhat, but to what extent it is impossible to judge.

### B. C. Will Collect New Timber Exhibits

W. J. Brandrith, of Ladner, B. C., exhibition commissioner of British Columbia, has received instructions with regard to renewing the representation of British Columbia at exhibitions during the coming year. For several years past, part of the British Columbia exhibit at Winnipeg, Toronto and other eastern points has consisted of samples of the various woods found in the provincial forests. It has been the custom to leave these samples from year to year at the same place, thus forming a sort of permanent exhibit. The Department of Agriculture has come to the conclusion that these particular blocks of wood must by this time have become rather familiar to the sightseers at eastern fairs, and Hon. Price Ellison has instructed Mr. Brandrith to see that they are replaced by fresh ones. For this purpose Mr. Brandrith will make the round of the various sawmills of the province in order to select blocks suitable for exhibition purposes. Owners of sawmills will also be requested to keep for the government any piece of wood which they may think would help to form a creditable display. Mr. Brandrith will get to work at once and by the time the fall fairs come around next year he hopes to have complete new sets of samples of British Columbia woods on exhibition at all points in Eastern Ontario.

### The Year Book of British Columbia

The year book of British Columbia which made its last previous appearance in 1903 has again been published, in the form of a substantial book of over 350 pages, excellently illustrated, attractively

made up, and well bound in a handsome red cloth cover. The book is essentially a work of reference, regarding matters of general interest pertaining to British Columbia and contains information of an extremely useful nature regarding the present social, political, industrial and economic conditions of British Columbia, together with a reasonable amount of description of smaller conditions in the immediate past. Accuracy, reliability, and completeness have been the aims of the author of the book, Mr. R. E. Gosnell, former librarian of the Legislative Assembly and secretary of the Bureau of Statistics. His efforts have been unusually successful. Lumbermen of British Columbia and of Canada in general will be particularly interested in an excellent chapter devoted to the forest wealth of the province, in which a great deal of information is contained. Another chapter is devoted to a description of the principal forest trees of British Columbia. Similar interesting chapters are devoted to other principal industries of the province and an excellent consideration is included of municipal affairs, railway and electric enterprises, social conditions, military affairs, etc. The book opens with a detailed historical review of the affairs of the province. In addition to the subjects outlined a vast amount of valuable general information is included.

Copies of the year book may be obtained from the King's Printer at Victoria, B.C., at the price of \$1.15 each. In Great Britain and on the continent, applications for copies should be made to the Hon. J. H. Turner, agent-General for British Columbia, Salisbury House, London Wall, London, E.C., England.

Vancouver sawmill men have asked the City Council to request the Great Northern Railway Company to buy all its supplies and timber in Vancouver for the proposed new wharves on Burrard Inlet, according to a press despatch. The contractors for the Great Northern wharf are H. Chase & Company, of Seattle.

### Calendars for 1912

The Campbell-MacLaurin Lumber Co., Ltd., have favored their many friends in the trade with an attractive calendar and the care which they have taken in its preparation indicates the attention they devote even to the minor details of their extensive business. The calendar is an exceptionally large one, the upper half consisting of a colored picture reproduced from the painting "A Thousand Terrors" by A. G. Voss. The calendar figures are in large type which will be greatly appreciated by those who are so fortunate as to receive a copy.

The Midland Lumber Co., Parkesburg, W. Va., manufacturers and wholesalers of hardwood lumber, have remembered their friends in the trade at this season of the year. Their souvenir is in the form of an artistic water color reproduction which will be highly thought of by those who have been favored with a copy.

The Universal Portland Cement Co., Chicago and Pittsburg, sent out to their friends in the trade an appropriate calendar throughout which are reproduced illustrations of many of the buildings which have been constructed wholly of their product. The calendar is attractively designed and will be welcomed by the lucky ones who receive it.

Of the many calendars which are sent at this season of the year none are more worthy of notice than the one distributed by the Fraser Bryson Lumber Co., Ltd., wholesale lumber dealers, of Ottawa. The water color picture, "Moonlight on the Columbia," is quite a commendable innovation and will be greatly admired.

An artistic calendar has been sent out to the trade by Bartram Bros., Ltd., wholesale lumber dealers of New York City and Ottawa, Can. It consists of a water color reproduction of a beautiful landscape which is daintily mounted on cream colored paper, with border margins of dark green. The general design of the calendar is excellent.

John Donogh & Co., wholesale lumber dealers, of Toronto, have sent out an excellent calendar for 1912, consisting of several colored reproductions of pictures, representing very accurately typical operations in the woods, on the river, and at the mill, in addition to a large calendar pad.

West & Peachey, Simcoe, Ont., manufacturers of the celebrated Alligator Steam Working Tugs, have favored the Canada Lumberman with a copy of their interesting calendar for 1912. The greater portion of the calendar is devoted to a colored picture representing their tugs in operation. The friends of West & Peachey will gladly welcome the receipt of their annual souvenir.

## Active Trade in United Kingdom

**Wood-working Industries Busy—Demand for Lumber Buoyant—Good Market for Quebec Pine and Spruce**

By James Hammer Quail

At London, business in softwoods has been quite active for a time so near to Christmas. The demand for timber from some branches of trade is seasonably quiet. Builders always make haste to get new property covered in and well out of hand before Christmas. This means that the joinery work of new buildings will be at the minimum, though, as stated in an earlier letter, a good deal of such work for large special structures may be in hand through the winter months, being got ready in advance. In regard to residential houses, work is finished as completely as possible before winter arrives, and little is left about them for joiners to do. In London, house building is now very quiet, but other branches of wood-working are busy, so that on striking an average it is found that wood-workers are well employed generally. In the furniture-making branch there is very fair activity. In the packing-case branch the Christmas trade is still keeping shops and hands very busy, and the demands for the new year will make up for anything which may fall away through the coming of Christmas. In the wood-paving branch, winter though it be, there is much activity, while in the mining-timber branch the consumption is on a large scale and the handling of this timber at quays and yards is keeping staffs busily employed. Despite the quietness in the house-building trade, floorings have been in good demand in London. Stocks are now light and values are firm. The demand for yellow pine for general joinery and for cabinet makers' uses continues good, higher grade wood especially being wanted.

The public sales have again shown that the timber trade generally is in a healthy state. Oregon deals, Quebec pine, spruce, floorings and matchings have found ready buyers, though in some cases it has been said openly that particular lots ought to have brought more money. The lots have, however, sold without difficulty and prices in the main are firm. Sawn pitch pine has had a fairly satisfactory market as regards the quantity sold and the prices obtained. American cypress and whitewood, plain oak and quartered, have found ready buyers at all prices.

At Liverpool, the demand for Canadian woods has improved and a very fair amount of business is being done. Pine deals and boards have been in good demand. Yellow pine deals are only in moderate supply. Red pine deals and spruce deals also are in small compass, and are firm in price. New Brunswick and Nova Scotia spruce deals have sold more freely, Quebec spruce pine and waney pine have been in more demand, and the stocks of these woods are now moderate. Birch logs continue to sell readily. Planks are in good demand and prices have advanced. Canadian oak has sold more freely and stocks are now light. At Manchester, the timber trade is now brisk, thanks to the activity in the timber-using trades of the district. Quebec board pine has sold freely but a fairly large stock of this wood is now held. Spruce deals have been in good demand and stocks are at present ample. Sawn pitch pine has sold well and heavy planks have had a fairly good sale. Birch planks have been in large demand and stocks are now small. Canadian and American oak has sold steadily, but stocks are fairly large.

At Hull, business in the timber trade is in a more satisfactory state, the consumption of timber having increased. Pine deals and boards are passing more freely into use and pitch pine logs have become scarce. The coal-getting industry is fully maintaining its demand for its own special kinds of timber, and stocks of this timber are light.

On the Tyne, similarly, business in the timber trade has improved. Deals are being taken freely for shipyard uses, and an increased demand has come from the district, for soft-wood, for joiners' and case makers' work.

At Glasgow, the demand for softwood continues fairly active. Pine deals and sidings of first quality have been much called for and are now scarce and slightly higher in price. Spruce has been in moderate demand. American hardwood is selling readily. Shipbuilders are still taking wood freely, California redwood, Oregon pine, waney pine, pitchpine, oak and teak, all being in fair consumption in the shipyards.

### The Timber Trade and the Insurance Bill

The Executive Committee of the Timber Trades Federation of the United Kingdom have not wholly approved of the National Insurance Bill which has just passed through the Commons' House of the British Parliament. At a recent meeting of the committee attention was drawn to the fact of the Government having introduced an amendment in the schedule bearing directly on the timber trade. When the bill was before the standing committee, saw-milling and

wood-working were added to the trades to which the provisions of the bill will apply. A resolution was passed by the committee protesting against the alteration which had been made in part 2, whereby saw-mills had been scheduled in the list of trades, to which the provision for unemployment insurance will apply and strongly supporting an amendment which Mr. Ion Hamilton Benn, M.P., had placed on the notice paper of the House of Commons, with a view to restoring the bill to its original form and urging upon the members of the Federation the importance of requesting their local members of Parliament to support the amendment.

### Federation Members and Finances

At the meeting of the Executive Committee of the Timber Trades Federation referred to above, the membership and the finances of the Federation were reported upon. A membership of 476 as compared with 420 at the beginning of the year was reported. With regard to the finances, the income from all sources during the Federation's year, 1911, was stated to have amounted to £1,000. The estimated expenditure was £500, which left a balance to be carried forward, of about £500. In the course of the year the committee have had important questions affecting the trade before them; that of the terms of credit which led to the reaffirmation of those terms, in October, being perhaps the most important of all. Railway charges and the increased charge made by the Port of London authority have also occupied much attention and have led to representations being made to the proper authorities, with a view to obtaining concessions on the most favorable terms possible, for members of the Timber Trades Federation.

### The Late David Jardine

The gross value of the estate of the late David Jardine, timber broker of Liverpool, has been returned at £824,949. Bequests to the total amount of £12,000 are made under Mr. Jardine's will, to eight public hospitals, infirmaries and orphanages, at Liverpool, sums of £1,000, £1,500 or £2,000 being bequeathed to each of the eight institutions.

## Light Stocks of Southern Hardwoods

**Shortage Reported of No. 1 and No. 2 Common Plain Oak—Probability of Advancing Prices in Near Future**

The record of wholesale prices of lumber, for the third quarter of 1911, issued by the U. S. Forest Service, gives the following summary of trade conditions:

Comparing the prices of western softwoods for the third quarter with the preceding quarter of 1911, there was a slight general decline, though a few woods showed improvement. Douglas fir was slightly lower. Flooring No. 2 flat, 1 in. x 4 in., decreased 80 cents in Oregon and \$1.40 in Washington. There was a fall in the prices of western red cedar, and also white fir, western hemlock, larch, Sitka spruce, and western spruce as well. The better grades of western yellow pine were slightly lower in Oregon, though in other States all grades generally improved. Sugar pine showed the greatest increase of the western softwoods. Shop No. 2, 2-in. x 8-in. and wider, brought \$2.16 more, and firsts and seconds clear \$5.60 more than in the second quarter. Prices of western white pine, including Idaho white pine, were generally higher. In Idaho the increase was from \$1.50 to \$3.25, according to the grade. California redwood was the other western softwood to record a notable increase. The advance of common boards No. 1 amounted to \$3.16.

Of the eastern softwoods, hemlock in the Lake States and Eastern States held substantially firm with the prices of the second quarter. The greatest variation was in Michigan, where a few of the upper grades showed a reduction of 60 cents. The prices of spruce in New England fell, the decrease in Vermont and Maine ranging for the lower grades from \$1.33 to \$1.50. The reverse was the status in West Virginia. Here merchantable spruce boards 1 in. x 12 in. 10 ft. to 20 ft. and box boards 1 in. x 4 in. x 12 ft. rose in price. The latter increased 73 cents and the former \$1.03. Prices for white pine were recorded from 12 States. For the mill-run grade there was general uniformity with prices of the second quarter except in Wisconsin and Minnesota, where the decrease ranged from \$1 to \$1.50. In Tennessee this grade scored the only marked improvement; the increase was \$1.68. The upper grades of white pine brought better prices, "selects" making an advance of from \$3.30 to \$4 in Wisconsin and Michigan. No. 1 rose to \$2.95 in Michigan and Minnesota to \$1.67. In Wisconsin, West Virginia, and Tennessee this grade of white pine was staple. Prices of yellow pine, the most abundant of the eastern softwoods, showed slight general improvement in all grades, especially throughout the Mississippi Valley States. The most notable increase was in Alabama,

where common board No. 1, S2S 1 in. x 10 in., and No. 2, S2S 1 in. x 8 in. amounted to, respectively \$1.07 and 74 cents. The most marked decrease was in Georgia and Florida, where the three grades of B and better flooring showed a decline of from \$1.75 to \$1. Generally there were indications of slight improvement in South Carolina, but in North Carolina there was no appreciable change.

Compared with the second quarter, hardwood prices varied considerably, according to species and locality. Ash showed improvement in Ohio, Tennessee, and Kentucky, but in Virginia and West Virginia experienced a decline. Basswood increased in the Southern States, but in the Lake States the prices were slightly depressed. Birch, firsts and seconds, scored an advance of over \$2 in West Virginia, and in Michigan \$1.15, but in New York and Vermont prices were lower. No decreases were noted in any States in the prices of chestnut; the largest increase was in Tennessee and West Virginia, where firsts and seconds rose as much as \$2 per M. Cypress prices improved in all States, while gum remained generally staple except in Mississippi, where firsts and seconds advanced \$1.75. Hickory prices were higher in Wisconsin and West Virginia, remaining generally firm in the Southern States, and showed depressions in Ohio and Indiana. The prices for both plain and quartered oak were characterized by decided gains. The average increase of all the grades probably amounted to over \$1.50. Poplar prices were exceptionally staple. In Louisiana tupelo made an advance in all grades, while hard maple generally, except in Pennsylvania, showed uniformly slight improvement.

A comparison of prices for the third quarter of 1911 with the corresponding quarter of 1910 shows western softwoods generally lower except western hemlock and western pine; in these there are slight indications of improvement. Eastern softwoods as a whole showed a fairly uniform increase. Nearly all grades of yellow pine, particularly in the Mississippi Valley, made advances. In Georgia, Florida, and South Carolina the conditions only slightly improved, while in North Carolina prices remained uniformly staple. Hemlock in the Lake States changed for the better, but held constant in West Virginia and Pennsylvania. White pine, eastern spruce, and West Virginia spruce showed improvement.

Hardwoods, more than either the western softwoods or the eastern softwoods, showed generally larger and more decided gains over the same period in 1910. The most notable improvements were in the general prices of oak, ash, and chestnut.

### Forestry Convention Arrangements

Arrangements are rapidly approaching completion for the Annual Convention of the Canadian Forestry Association which will be held in the Railway Committee Room, Parliament Buildings, Ottawa, on February 7th and 8th, 1912. The gathering is under the patronage of His Royal Highness, the Governor General, and a number of distinguished men both from Canada and the United States have promised to attend and take part.

The Canadian Lumbermen's Association holds its Annual Meeting on February 6th. Special rates have been granted by the railways and as the subjects to be discussed are of the most practical and pressing character, it is expected that there will be a very large attendance of all persons interested in our forest resources.

The office of the Secretary of the Canadian Forestry Association is in the Canadian Building, Ottawa, and from him further information may be obtained.

### Hardwood Markets Need Close Study

In a report upon the hardwood market conditions in the United States, Mr. Lewis Doster, Secretary of the Hardwood Manufacturers' Association, sounds a note of warning about the probability of a shortage of stocks in the near future.

The conditions of the market from the hardwood productive standpoint, he says, should be considered with more study than the average man interested in the industry has done. There has been more misleading conditions existing this year than ever known of. For an instance: A certain class of lumbermen who handle Southern hardwood products, in a great many instances when approached, have been exceedingly open as to expressing their idea how poor business was, and by stating often that there was nothing moving and also expressing themselves that stocks are so far beyond the normal condition as to size that they are afraid to go in. These have been the misleading statements.

Take the class of trade who represent the manufacturing interests or who have large wholesale yards, and control large blocks of stock, when these men are approached, they have very little to complain about the present business condition.

Nearly every one has had the pleasure of doing more business than the corresponding month of the previous year. Their prices on certain items have been satisfactory, and some grades not so; but on the whole, with the country in the state of "political adversity,"

"trust busting" and "muckraking," every one is doing fairly well.

Buyers of lumber should know of the small average amount of stocks carried on sticks by the Southern manufacturers. There is certainly no accumulation of any that will cause the holder to worry or force any sale thereof. Not that there is going to be any shortage of stock for any one, but that there is none too much, and when the time is delayed in buying, a right smart tendency of stronger prices will greet the late comer into the channel filling his part empty yards and spaces at the factories. For instance: One trip that I made to a large concern exposes the conditions of a shortage of 12,000,000 feet as compared with their stock one year ago of 25,000,000 feet short of their stock two years ago. These figures were obtained direct from the stock books, and the most amazed person was myself when I discovered from purchases that there was no plain oak No. 1 or No. 2 Common for sale from this vast amount of hardwoods, which represents one of the largest stocks held in block of Southern hardwoods.

Buyers should take warning and realize the conditions which confront them, for the time is coming when the season for bad weather is on, and car shortages are inevitable.

## Prevention of Sap Stain in Lumber

### Results of Test Show that the Best Treatment is in a 5 to 10 Per Cent. Solution of Sodium Bicarbonate

An exhaustive series of tests upon various methods for the prevention of sap stain in lumber were recently made by the U. S. Forest Service, the results of which have been published in a circular. The tests were made with southern yellow pine (longleaf), but the conclusions reached are of a general nature and will be of much value to the industry. After detailing the tests and the results secured the circular says in conclusion:

1. Freshly cut sap lumber when stacked in the yard to dry should be stacked in open piles to permit the free circulation of air. Boards so piled season in about half the time required for those piled in close piles. Open piles, moreover, are not so severely attacked by insects and are more effectively protected against sap stain.

2. In commercial work, sap stain can be most effectively prevented by dipping boards in solutions of sodium bicarbonate. Such solutions, though they give fairly good results, leave much to be desired. The strength of the solution should be determined by the severity of the conditions under which the boards are to season, but in general it will require from 5 to 10 per cent. Care should be taken that the chemical used is not mixed with adulterants.

3. The best results in preventing sap stain were secured with mercuric chloride solutions, but on account of their poisonous nature they are not recommended for general use.

4. The solution made by mixing sodium carbonate and lime was not as effective as one of sodium bicarbonate alone. Moreover, it had a greater tendency to streak the surface of the boards with a white precipitate.

5. Solutions of magnesium chloride, calcium chloride, sodium hydroxide, phenol, copper sulphate, and zinc chloride did not prevent sap stain; nor did sprinkling the boards with naphthalene flakes give satisfactory results.

6. On account of cheapness and facility in operation, it is recommended that sap-stain solutions be applied to the boards by machinery. If this is done, the cost of treating lumber with solutions of sodium bicarbonate will amount to from 7 to 10 cents per 1,000 board feet.

7. The indications are that shavings planed from soda-dipped boards do not burn as readily as those from untreated boards, but the difference in inflammability is so slight that for commercial purposes it may be neglected.

8. At the same moisture content sap-stained boards are slightly weaker than those free from stain, but the difference is so small as to be of no practical importance.

9. Soda-dipped lumber is a little stronger, stiffer, tougher, and has a greater surface hardness than natural lumber, but these differences are exceedingly small and for practical purposes may be neglected.

One of the tasks undertaken by the National Lumber Manufacturers' Association is the attempt to standardize the manufacture of lumber as to lengths, widths and thicknesses, and as to patterns for worked stock. The association has appointed a committee to work out details. The purpose is to have each of the associations affiliated with the national organization represented on this committee. Not all of these constituent associations have yet made their selections, but the following men have been appointed:

# The Retail Dealer and His Problems

## The Mill Work "Code of Ethics"

The so-called Code of Ethics referred to in the following article was recently circulated among the trade. Efforts to trace it to its origin showed that it is in no way authoritative, and that it does not express the sentiments of any considerable number of sash and door manufacturers:

Recently I received a circular with the heading "A Code of Trade Ethics" and immediately following: "A statement of trade relations between the wholesale manufacturers and jobbers, making and handling doors, sash, mouldings and general mill work and the retail dealers handling lumber and other building material."—Then it goes on to repeat the correct business policy which has for many years been acknowledged and accepted by both branches of the trade, namely, in brief, that wholesalers should market their products through regular channels only, and the retailers should buy only of those wholesalers practicing this policy.

Then follows, the reasons why the wholesalers may without prejudice use their own judgment in abrogating their obligations to the regular dealers, and solicit and sell to others that are named in ten specifications. I will not quote these in full but will put them in a shorter form, so you may get hold of their import more easily. The "others" are in the following:

Those who live where there are local factories and in the immediate territory owned by such factories.

Purchasing departments of railroads and large industrial wholesale manufacturing corporations.

Municipalities, school boards and other public corporations. General contractors handling large operations.

Purchasers of mill work amounting to not less than \$750, on which bids are sought regardless of the local dealers.

Hardware dealers, and general merchants, in places where there are no lumber yards.

Consumers that want special sizes of goods not kept, or only in small assortment by the local dealers.

Co-operative lumber yards.

Consumers wanting such things as plate glass, leaded glass, church windows, furniture, office, store and bank fixtures, rolling partitions, cabinets, mantles, grilles, wood carpet and other similar lines.

Those living in another community may have goods shipped to them on order from any dealer in mill goods living in another town.

In addition to all this it is held to be proper by this code-making coterie that:

"As a general rule any firm commonly purchasing mill goods for sale to others should be considered as a retailer in that line, even though a limited stock is carried."

### What Is Left the Retailer?

Now, my friends, after you have read this and taken time to think over and analyze it, you will naturally ask, "What is left for the exclusive sale by the regular retail dealer?" I declare it puzzles me to see where he comes in at all in this respect, for, according to the last provision quoted, any hardware dealer buying screen doors from these code-makers may put in a bid for the mill work on a dwelling house he is furnishing the hardware for.

They specify contractors handling large operations. Any contractor who may have contracts for two or three houses to build might think he would come in under that head, and I've not a particle of doubt but that it would be so constituted by some traveling sales agent of one of these concerns.

An old Arab proverb says, "When once the camel gets his head in the tent his whole body is sure to follow," and it will be so with the manufacturers and wholesalers of mill work if this so-called "Code of Ethics" of their making becomes their policy in marketing their goods. For once this is adopted it won't be long before the regular retailer will be only one of their lines of customers.

It is a pretty shrewd move on their part, but whether they make it win remains to be seen. I should think more of it if the circular had been signed by those who got it up, and the fact that it was not leads me to believe that it was put out among the regular dealers as a feeder to ascertain how it would be accepted by them. I don't for an instant think that all the manufacturers of mill work are parties in the scheme. I know some of them too well to believe they would mix up in a deal of this kind. They are too honorable and high class men to send out a communication like this, without

signing their names to it, and the sooner they come out and discover their connection with this assumed authority the better for all concerned.

I am simply expressing my own opinion in the matter and as it looks from my point of view. It is furthermore my opinion that this circular is an expression of the line of policy which those who got it up want and would like to pursue, and undoubtedly they will attempt to carry it out on the lines indicated therein. If they succeed in doing this it will have a tendency to force all others into the same course of policy.

### Conditions in the Mill Work Trade

In justice to this manufacturing branch of the lumber industry I would say that the conditions prevailing in the sash and door trade are but little known among the retailers. They have practically no idea of how demoralizing they are and have been for a long while, and knowing what I know of these conditions I can but feel that it would have been the wisest course for the mill work people to have come out with a plain statement of those conditions to the retailers, letting them know just what they were (instead of having an unsigned document as this "Code of Ethics" go out and meet with the condemning criticism that it has).

Every line of business has its own peculiar troubles to contend with. But I doubt whether any one business has so many and so varied a lot of difficulties to cope with as the sash and door manufacturers, wholesalers and jobbers, and there are so many diverse interests among them that it seems impossible to get them to work together on any well defined and uniform policy. Several attempts have been made to achieve this end, but there was not cohesion enough to insure a working union among them. As one of them said to me last winter, "We are demoralized almost beyond the hope of recovery." I am satisfied that a great majority of the larger concerns are loyal to the interests of the regular retailers and do not knowingly sell through irregular channels. But, when it is considered that seventy per cent. of the stock mill work that is manufactured is sold to the jobbers, it is manifestly plain that the manufacturers have no further control over its disposal after it passes from their hands. The jobbers sell to whomsoever they please, and as the mail order concerns handle a large amount of this class of goods they are among the strongest bidders in the market for it. There are many times when the business is suffering from over production as the lumber business is, and large quantities of stock may be bought at very low prices. Trade is dull with the retailers and the demand is slow from them. Consequently the opportunity is offered to those who have the cash to buy them up and speculate on them and sell at an advance to whoever wants them, whether it be a dealer or a consumer. And the fact is there are a good many retailers who will shut their eyes as to where they come from as long as they are getting a good bargain in buying lower than the regular prices quoted them by their friends among the manufacturers. It is natural for the latter to expect reciprocity from the dealers, but in a good many cases they don't get it, and therefore, under the circumstances, I have wondered that these manufacturers continue to be so loyal as they are. There is a certain class of business men who have adopted a well defined principle in the government of their business. They conscientiously adhere to it in spite of any inducements offered them to the contrary, and I believe we have as many of this class of men in the lumber industry as are to be found in any other business on earth. The proof of it is the continuance of so many of the old-timers in the trade. The lease of life is short to any business man who would do otherwise than the "square deal" in his trade relations.

### Has Been Slipping Away

The millwork trade has been gradually slipping away from the retail lumberman until he has but a comparatively small proportion of it to what he used to have. I remember the time when I could figure on and sell any bill of such goods as were in common use at that time. What extras were named in the bill usually were listed in the sash, door and molding books of the period. Once in a while we would get a bill of mill work to figure on for a large public building, such as a court house or a school building, the plans of which had been drawn by a professional architect and, of course, there were a number of items in it that had to be specially made. In such a case we would send them in to get figures on from the concern with whom we traded, or some traveling salesman would give us the assistance required. But as a general thing the class of school buildings and churches built in those times didn't call for

anything in mill work but what we could readily figure on and furnish ourselves.

Nowadays, however, the more pretentious class of buildings are built from architect's plans and specifications, and therefore there is a good deal of divergence in the character of the mill work, requiring an expert to correctly figure out the cost. Such jobs are let out to a contractor who is competent to do them, but in getting his estimate from the local dealer he is informed that the total figures cannot be given until it has been ascertained how much some items in the mill work will cost. It takes more or less time to get this information, as we all know, and local contractors usually expect the dealers to give it in shorter time than is possible. As a consequence of all this contractors have come to think that they can just as well send away and get an estimate on this specialized work as the dealers can, and thus save the dealer's profit for themselves. This habit, once formed by a contractor, gives him a feeling of independence of the dealer, and being posted as to the cost of the more staple class of mill work he requires that the dealer should sell him this on a low margin of profit to keep him from shipping it in himself.

#### Special Work Is Increasing

In the larger towns the proportion of special work is constantly increasing, and, as a matter of fact, it is too much for the average dealer to handle. As long as he could figure of the cost of the sash, doors and moldings for a house in the space of an hour or two, he was master of his business in this particular. But the knowledge that is required nowadays for this line of estimating is beyond his ability, and therefore is one of the principal reasons why a good share of this trade is passing from him. It would be difficult to tell how great the percentage is of this special work that is called for in dwelling house construction. I would give a guess that it is fully one-fourth of the millwork trade. Now add this to what is shipped by the mail order houses and the amount would be found to be considerable that has been lost to the business of the regular dealer. Theoretically, he is entitled to all the mill work trade originating in his territory, where there are no local factories to compete for a share of it.

I have never harmonized with the agreement allowing wholesalers to sell jobs to a certain limit, for the supposed reason that the local dealer was unable to handle it. There is no radical difference between a dealer selling one or two thousand dollars' worth of mill work that he don't keep in stock, and the same amount in value of odd sizes and lengths of timber and other dimension stuff and special items of other lumber that he don't keep in stock. He generally gets figures on those and he can do it also on the mill work.

I am speaking of what he can do if he knows his business as he should know it to meet any competition. But he can't do it by remaining as he was twenty years ago, for things in general with the business have materially changed since then.

If a dealer is located in a town where there is a local factory making general mill work he has a hard proposition to contend against. The factory people claim they shall have all this class of trade because they are a home institution, and the retailer thinks he would be doing more than his share to support it if he were to wholly relinquish this portion of his trade to them. So he continues to keep a stock of this class of material and do the best he can in the competition. The average small factory cannot compete with him in the selling of stock sizes of sash and doors, but they can worry him in the making of moldings, frames, and general odd work that he would otherwise sell if they were not there. These small town factories are rarely paying institutions. They have generally a low rating with the credit agencies. If a dealer sells any stock to them he is expected to take most of it out in trade, for he gets little cash, and they are hardly ever clear on his books. If he ties up with them in a trade agreement he is pretty liable to get the worst end of the bargain. Of course, they seek work and trade from the surrounding towns, which means more or less of close competition with the dealers in those towns, and not being interested in the "home institution" proposition they are apt to resent the intrusion into their trade.

#### Each Situation Presents a Different Problem

It would hardly become me to offer any advice in a matter of this kind, for the difference in conditions and circumstances is so varied that every one so circumstanced must work out his own problem in dealing with them. I don't think I should tie up with any factory, with the knowledge I now have of them. I think I should go on and compete with them for the trade, just as I would with any other concern that was in the field for a share of the business I was in. There was a time when I might have felt more favorable to a home factory, but now with the mail order house and other outside competition to contend with I would consider that under the circumstances my first thought should be for the interests of my own yard.

A local factory cannot afford to purchase their stock lumber

from the local lumber yard and what they do buy is a "forced put" with them. Purchasing at wholesale, as they do, they naturally object to paying him his regular prices. As with the retailer they go into the market to buy and sell again, and therefore I don't see as the dealer is under any more obligation to patronize the local factory people than they are him. Both are under the necessity of buying their stock at wholesale and selling it at a profit.

In some respects a local planing mill and factory is an advantage to a dealer, but on the whole it is a serious competitor as long as its capital and credit lasts, for it not only competes with him in the sale of sash, doors and moldings, but it goes into the making of cornice, porch and other outside finish, and all the inside finish in the average building they can furnish also. So that if he surrenders the furnishing of these things to the local concern on the sentimental grounds of its being a "home institution" there is nothing else left him but the sale of material for the bare superstructure of the building, and the profits on this won't put much meat in his frying pan. In some instances a concern of this kind has an imitation lumber yard in connection with it, something after the order of those to be seen connected with a grain elevator, and while they don't sell a great deal they are demoralizers of prices.

I cannot help but believe that a good lumber yard, carrying at all times a varied and ample supply of stock sufficient for the needs of the public, has the first call on the obligations of the community to patronize it. Of course, this carries with it also the obligation of that yard to deal justly and fairly with all and not attempt to get other than a decent return for the investment and labor.

C. H. KETRIDGE, in the Mississippi Valley Lumberman.

#### Skinning the Customer—Ways and Means, and Results

"Skinning the Customer. Does it Pay?" This was the frank and practical title of a paper by Mr. W. C. Hartman, read before the recent semi-annual meeting of the National Slack Cooperage Manufacturers' Association. Needless to say, the writer's view was that it does not pay, but his arguments were so good that they place the matter in an unusually strong light. The arguments, moreover, can be applied to other branches of the lumber trade. They afford a particularly striking analogy between the cooperage trade and the trade between the retail lumberman and the wholesaler. The principles governing the relations between the cooperage manufacturer and the jobber or consumer, as explained by Mr. Hartman, can be applied to the trade between the wholesaler and the retailer and will be found to fit the case very nicely.

After a few introductory remarks Mr. Hartman's paper continued as follows:—"The subject confines one to the ways and means by which the consumer is "skinned," although I have no doubt that the originator of this title knows that something could also be said about the manufacturer being "skinned." The cooperage business is no different from any other in that it is made up of different classes of people with varied ideas of business morals, rigid or elastic consciences and individual ideas regarding what is fair and square in business.

Who gets "skinned" the most is a question. I could give you many instances where undoubtedly the manufacturer has been badly and unjustly burned by the purchaser of stock, in some instances the jobber and in others the consumer. I have seen cars of stock in warehouses and at cooper shops on which the consumer was demanding a discount and getting it freely from the manufacturer located at a distant point who figured it was cheaper to be held up than to go to the expense of investigating and perhaps follow up the matter with a lawsuit. Such a course as this encourages unfair and dishonest dealing on the part of the consumers and the jobbers of stock.

#### Purchaser in Wrong

Endeavoring to confine oneself to this particular subject, it is not difficult for anyone with very much experience to recall many instances where to his knowledge the purchaser of stock has been unmercifully "skinned." I take it that reference can be properly made to the purchaser, meaning either the jobber or consumer. There are many ways, direct and indirect, by which the buyer of stock can be cheated and made to lose money at the shipper's advantage. One of the best established and popular methods is that of laying down on contracts, and there are several ways to do this, although the results are generally the same. On advancing markets when the manufacturer has sold to either a dealer or consumer at a comparatively low price he is necessarily subjected to temptation to "skin" the grade and in that way "skin" the consumer. Carrying out a cooperage contract is not always accomplished by making up stock of whatever grade and quality he has through the plant and loading it in a car for transport, but the exact quality and grade of material sold is a feature of the deal as the time of delivery. The seller are definitely outlined both in law

ness generally. His duty on the face of the deal is simple enough. Whether the prices are high or low at the time of shipment, whether the stock has been bought at a close figure or a good margin of profit makes absolutely no difference. He is bound to deliver to the purchaser at the time of shipment specified the quality of stock bought. Many times a purchaser has to receive inferior quality or none. Depending upon who the seller is, he determines whether or not this is essential in order to get the stock at all. If he objects to the grade the other fellow in some instances says that is the quality he is making, it is passing inspection with others and the purchaser must take it if any. Thus the contract is filled but most unsatisfactorily because the consumer takes stock of a lower grade or perhaps at different times than agreed upon, at a loss to himself and knowing that if he did not do this his damage in buying at a higher price and in the quality originally purchased from the other fellow would be very much greater.

There are instances where no effort is made to get out timber and fill contracts, because the markets have gone the other way and the deal is unfavorable to the shipper. Floods do extraordinary damage, the weather prohibits getting out timber and unexpected things occur at the mill that absolutely prohibit the fellow from filling his contract and compel the purchaser to buy on the market as best he can. We have known cases where the consumer was put to a large loss in not receiving the quality of stock purchased and the manufacturer was sore and became a "knocker" of the buyer immediately, when as a matter of fact he should have apologized for being unable to carry out his contract and paid the other fellow the loss sustained. It is most extraordinary how some people will insist upon looking at a deal from their own prejudiced standpoint.

#### Gradual Elimination

As to the remedy—there is none. In the cooperage line just as in all other branches of industry there are and always will be people who cannot be depended upon to make or furnish a good quality of stock or to carry out any contract where the prices go against them. Some people do not do this because they think they cannot afford it financially, although they would like to be honest. Others who can afford to suffer a loss refuse to do so in order to make additional profit. A friend of mine recently referred to the increased traffic and large number of automobiles on our city streets and said that most of those who had not been educated had been eliminated. Just so with some manufacturers who have refused to be educated in making good stock or dealing fairly. They are gradually eliminated from consideration by the people who want to do real business on a business basis.

In support of this theory I remember hearing one large purchaser of stock say that he did not open mail from a certain concern but put all of their letters, sealed, into the wastebasket whenever received, and another very large purchaser who voluntarily remarked that he went even further and his office boy was instructed to throw away, without opening, all letters from cooperage people postmarked a certain town, because, as he explained, he did not know any reliable concerns located there and did not have time to separate or become acquainted with them. These instances only go to show how instead of tolerating poor stock and continual wrangling the consumer prefers to drop those with whom he does not find dealings satisfactory and patronize the better class.

After a buyer, whether he be a dealer or a consumer, has a certain amount of experience in the cooperage business he soon learns who make good stock and who can be depended upon to carry out their contracts. Such people are the majority in the cooperage trade, I am glad to say. The other class give little trouble to the discriminating buyers of stock. For this reason the subject cannot be taken as seriously as the title would indicate. There is, in fact, no reason, except in extreme and exceptional cases, for the consumer or buyer of stock to be "skinned" at all. He will find the great bulk of manufacturers and sellers of cooperage material are men of integrity and reliability and if he deals in the right place his troubles will be limited.

#### The Cost of Collections and Deductions

By I. R. Lesueur

The subject Cost of Collecting and Deductions is so very closely allied with that of credits I can hardly treat of one without referring to the other. In the days of yore the question of a man's credit standing was of indifferent consideration; if he saw fit to credit it was presumed that he was entitled to it. In England, especially, there was a place prepared for those who betrayed confidence. How often have all of us wished for that old effect in this country, we would all be here to-day

we allow our confidence to be shared by anyone of lumber on credit, Bradstreet, Dun or some

other commercial agency must first advise us as to just what risk we take in doing so. Even then, though there is presumed to be practically no credit risk, the question of unfair claims for deductions is still with us. It is not my intention to attempt to suggest a remedy for this evil which is costing us considerable yearly, but some of the commercial agencies are now not only issuing publications showing a merchant's financial standing and promptness in paying his obligations, but also report the number of cases called to their attention where the merchant has made deductions considered to be unfair. These agencies should certainly have our support, but before we condemn the merchant a careful investigation should be made, for many times it will be found that the fault is really that of the shipper. The grade mixer who is called upon to stand heavy deductions only receives just what he deserves and the report of a shipper of an unfair deduction being made should not be given serious consideration until the shipper's reputation has been investigated.

The closer we scrutinize our credits and the better we know our customer the smaller is going to be the cost of collecting and less chance of an unfair deduction being made. It is absolutely an impossibility to arrive at any fixed cost of collecting and deductions as applied to the lumber industry—it depends so largely upon our credits, and our inspectors. If we select our customers carefully, load stock strictly to order, there is practically no cost of collecting other than the 2 per cent. allowed for cash in ten days. There is not a merchant to-day who can afford not to discount his bills.

"Two per cent. in ten days for cash" are practically universal terms, and hardly a one of our customers who can hope to realize a larger profit in the regular course of his business than the rate of interest he receives on his money is not taking advantage of these terms. If his banker, to whom he is certainly no stranger, does not consider the merchant worthy of such financial support as will enable him to discount his obligations I ask you do you consider the merchant, who in most cases is a stranger to you, quite justified in asking you to accept his paper? The successful merchant of to-day and the successful merchant of to-morrow are they who discount their bills.

I believe that all of you will agree with me when I say that our customers who discount their bills are in the majority and the 2 per cent. deducted by them of course is one of the costs of collecting. Two per cent. will also more than cover the costs of collecting from these merchants to whom we sell who do not take advantage of the cash discount, and taking into consideration the deductions made which are really unfair ones, I believe that the actual cost of collecting and deductions will just about amount to 3 per cent. on a year's business. I also consider that this 2 per cent. will cover the cost of our subscriptions to the commercial agencies and the amount paid to them for special reports as well as postage, stationery and the time used by our office forces in making collections, with a safe margin to cover the cost of any reinspections we are compelled to have made before collections can be effected.

In conclusion I will again state that the cost of collections and deductions depends very largely upon the care with which we select our customers and the class of stock we ship him. If the customer is A No. 1 and we ship him stock strictly to order, the cost of collection and deduction will not and can not be over 2 per cent.

#### Production of Wood Shingles

The production of shingles increases steadily in Canada. Compared with the Canadian lumber cut, the entire shingle industry amounted to less than the value of each of the most important species, spruce, white pine, Douglas fir, hemlock and cedar during 1910. Considered separately, the shingle production assumes considerable importance especially in British Columbia. This province is far in advance of the eastern provinces as a shingle producer and made up approximately half of the Canadian 1910 production of nearly two billion shingles, worth over three and a half million dollars. Over one-quarter of the shingles were manufactured in Quebec, where the five hundred and thirty-nine million pieces reported were an increase of sixty per cent. over the 1909 amount. Ontario and New Brunswick produced nearly equal amounts in 1910, one-tenth of the Canadian production being from each of these provinces. Ninety-eight per cent. of the total production was in the above four provinces, although shingles are made in every province in the Dominion. Nova Scotia, Saskatchewan, Prince Edward Island, Alberta and Manitoba together produced two per cent. of the total. The average price of shingles in 1910 was \$1.80 per thousand, the values ranging from \$1.51 for shingles in Nova Scotia to \$2.27 in Saskatchewan.

The 10th annual meeting of the Hardwood Manufacturers' Association of the United States, will be held at the Sinton Hotel, Cincinnati, Ohio, on January 30 and 31.

### Cost of Retail Lumbermen's Sheds

The question of the cost of a particular type and size of shed is often raised, but rarely can it be answered satisfactorily. The building of a shed is surrounded by so many conditions that probably they never all exist alike in any two instances. In two sheds built from the same plans, for example, the items of cost of one showed \$520 in excess of those of the other. The grading for one cost more than \$300, while the ground on which the other was located was so high that no filling was required. In the first, the foundation walls were set two feet deeper than were those for the shed that was on high ground, which of course added materially to the expense.

The framing of a shed is a matter with which ordinarily a carpenter deals, and the ideas of no two are alike. One, not understanding the art of construction, may use more material than another, and this adds to the expense. The builders may differ in their opinions as to the kinds of wood for the frame. A shed that had an excellent foundation was framed with hemlock, which answered every purpose, another with yellow pine, which answered equally as well, while the builder of the third would have nothing in the frame but white pine, seeing to it that it contained no norway, and this increased the cost of the building. A shed in a certain town, that cost \$2,800, appealed to the taste of a dealer in a town twenty miles distant, who was told by a contractor that he would duplicate it for \$2,400, guaranteeing it in every particular so far as the strength of frame was concerned. Two lumbermen built sheds from the same plans and specifications, but as one had a 10-cent rate and the other a 26-cent rate, naturally the cost of the two structures varied.

Oftentimes the labor bill is a matter of difference. When there is a union scale all carpenters are paid the same per day, notwithstanding some of them may be good workmen and others poor. If a man is no better versed in carpentry than to be able to drive a nail straight the wage scale applies to him the same as it would were he thoroughly competent. In towns in which there is no union, men are employed who, in the strict sense of the term, are not carpenters, and who do not expect to receive carpenters' wages.

Many sheds are built very cheaply, the builders not counting the labor of their own men, which practically costs them nothing, as their salaries would go on just the same no matter at what work they might be engaged. In an agricultural district a shed was built, during a dull period of trade when the farmers were busy in the corn fields, that looked to cost \$500 more than it did. The dealer had read how a foundation should be put in, how cement should be mixed, and the piers were placed without assistance. In the erection of the building a carpenter was employed who was assisted by two men from the yard. As the frame was made of light material, the posts built up 2 x 6, the yard men had little to do besides lumber lifting, the carpenter planning the frame and nailing the pieces in place. It was a rush job, but there was plenty of time and the shed was completed by the time the farmers had laid by their corn. This shed is 56 x 80 feet, and the actual cost to the owner is a matter over which he feels elated.

When pole sheds are built the setting of the poles is work that can be done by common labor, which means by men from a yard force, with some one in charge who can line up the poles in proper shape. The holes can be dug by anyone, and if set in cement the cement and sand can be mixed and dumped in by inexperienced hands. In fact, since the advent of cement for shed foundations the services of a mason, which generally must be roundly paid for, may in most cases be dispensed with.

It will be seen from the above that the cost of a shed is not a fixed quantity. A large number of retail lumbermen are more or less versed in building, and with the assistance of this knowledge, and the labor that at dull seasons is at their command, the cost of a shed may be made materially smaller than otherwise it could be.—American Lumberman.

### Timber Scarce on Hudson Bay Route

The forestry branch of the Department of the Interior calls attention to the misapprehension existing in regard to the timber resources on the line of the projected Hudson Bay railway, which have been described as abundant. Careful inspection of the timber along the route made in 1910 and 1911 by the forestry branch shows that there is not enough mature timber there to build the road. While there are trees everywhere, the forest growth, except on a mere fraction of the area, is too small for commercial purposes, and unless it can be protected from fire until it attains maturity it will never be of any use to the country. Explorations in other parts of the northern forest districts show that everywhere fire has worked havoc and that unless adequate measures are taken to protect the young forests that form the greater part of the stand the outlook for the future is none too good.

### Personal News of Interest to Lumbermen

Mr. C. A. Lyford, of Lyford Clark & Lyford, Montreal, has been on a business trip to New York and Philadelphia.

Mr. William Rutherford, of William Rutherford & Sons Company, Limited, Montreal, has been nominated as representative of the lumber and mill work section of the Builders' Exchange, Montreal.

Mr. Hugh A. Rose, Toronto, eastern representative of the Canadian Western Lumber Company, Fraser Mills, B.C., spent the week before Christmas in Montreal, where he succeeded in booking orders for 827,000 feet.

George D. Jackson, lumber commission dealer and manufacturer, who maintains the only commission dealer's office on Saginaw river, returned to his home recently from Georgian bay, where he was located the greater part of the season handling lumber. He shipped from that district 102,000,000 ft. during the season just closed. The Little Current mill manufactured 22,000,000 feet. He estimates the log output in that district at 30 to 35 per cent. less than the quantity handled last year. The concerns operating are cutting and skidding logs, but hauling will not begin until early in January. There is about a foot of snow in the woods. He says the amount of unsold lumber being carried over on the mill docks is comparatively small.

Mr. Arthur Rushforth, of 62 Dale street, Montreal, has been appointed British representative of the Dominion Mahogany and Veneer Company, Limited, which has just let a contract for building a factory at Montreal. The company is composed of Montreal capitalists, with Mr. N. Curry, of the Canadian Car & Foundry Company, as president and Mr. Butler as vice-president. The capital is \$500,000. The company has contracted for the necessary machinery, and will put up a well equipped building. It is proposed to make and keep in stock all kinds of tropical hardwoods for floors, interior trim, furniture and piano manufacturers. In addition to wood veneers, the company will manufacture rotary cut stock from Canadian hardwoods. By importing direct, it is hoped to make considerable economies and divert business which now goes to the United States. An expert manager, who has had a long experience in all branches of the hardwood trade, has been appointed.

### Fire Ranging Urgently Needed

The Department of Forestry has issued a warning relative to the need for an extended fire ranging system in the Hudson Bay district. There are no prairie districts of any extent in this section; there are trees everywhere, but owing to repeated fires the forest is a mere wreck of what it might have been had adequate measures been taken to protect it. If the northern forests are to be a permanent source of wealth to the country, it is absolutely essential that the protective system should be extended and that the public should be more carefully educated on the great importance of this question. In Sweden, which has a large extent of northern forests similar to those in northern Canada, the fire danger has been practically eliminated by protective measures and by educating the people.

At a recent meeting of the Home Market Club at Boston, Mass., a unanimous resolution was adopted protesting against the free importation from Canada of wood pulp and print paper. Congress will be petitioned to repeal the legislation on the ground that it is unjust to American paper manufacturers. After the resolution had been adopted, the Secretary, Mr. Marvin, pointed out that in 1906 and 1907 the paper producing countries of Europe, held by Norway, Germany, the Netherlands, Austria and Great Britain, had a surplus for export amounting to \$337,127,000, or nearly twice as large as the entire paper and wood pulp production of the United States.

According to recent press despatches Germany has made it known to the United States Government in unmistakable language that it considers the continued refusal to allow free entry of paper and pulp from that country as a direct violation of the favored-nation treaty and a breach of faith. The "minimum for minimum" clause as provided by the agreement must be granted, according to the German viewpoint, or the United States is not standing by its bargain. The fact that Canada is granted free entry of paper and pulp from untaxed timber makes it clear, according to the German Foreign Office, that the United States is not giving Germany the minimum tariff on this product.

The Port Arthur Young Men's Christian Association has made arrangements with the construction logging camp bosses to take charge of and distribute reading matter, such as magazines, books, illustrated papers, etc., to the men in the camps and along the railway line.

## The Linderman Autom

at a very small cost per thousand will convert you

The same machine on which you work up your waste and short shorts, can also be used for making wide dimension stock from mill culls and narrow widths.

A prominent lumber manufacturer recently was convinced of the profitableness of so utilizing his by-products, after ordering two machines he started out to establish his market, before the first machine was delivered the entire output for 18 months of the two machines were sold.

Utilizing the by-products has greatly increased the fortunes of many—you too can swell your own profits—you have the waste—we have the machine. The proof can be obtained by sending us samples which we will match up and return to you.

There is a machine built to meet every different condition, the lumber can be long or short, narrow, waney or live edge, tapering or straight, can be used for the manufacture of boxes, heading, sheathing, partitions, dimension stock, door or furniture cores, shelving, interior finish, casket, wagon or agricultural stock, car or furniture work.

Just tell us your conditions and we will outline our proposition to meet your particular case.

# CAMP DEPARTMENT

## He Refused to be Hazed

"Hazing in the logging camps has, I understand, gone out of fashion," said T. J. Walsh, a well known mining man of Duluth, "and it is just as well that it has, for the sport often took on a dangerous form. There was danger that the candidate for the hazing would get seriously hurt, and besides a camp that had a reputation for brutal hazing often found it hard to get new men. I once worked in such a camp, near McBride, Mich., and how hazing was broken up there is what I am going to tell you about.

"One day a slender, inoffensive looking chap about 28 or 30 years of age arrived at the camp to go to work. He showed up late in the afternoon, but before the men had gone in to supper it was understood by all old hands that there would be something doing afterward. After the men had smoked a few minutes one of them quietly approached the new man, who had been sized up and described by the men, among themselves, as a 'green Canadian,' and said:

"'Can you sing a song?'

"'No.'

"'Can you dance?'

"'No.'

"'Tell a story.'

"'No.'

"'Bill, get the blanket,' said the interrogator, turning to the expectant crew. The blanket was fetched, and was surrounded by willing men.

"'Come, get into the blanket,' continued the spokesman, turning to the stranger. The stranger looked at blanket, which was held stretched by the men in the middle of the room.

"'What do you want me to do?' inquired the stranger without betraying the slightest emotion, other than a tightening of the lips and a narrowing of the eyes, which the spokesman and the others failed to notice.

"'Git into the blanket quick. The boys want to have some fun with you.'

"'None of that for me,' said the stranger with decision.

"'Come ahead,' and the spokesman laid a heavy hand on the stranger's shoulder. It was then that the fireworks began. 'Bing,' and the spokesman fell among the blanket holders. In less than two minutes the floor was covered with wouldbe hazers, and the on-lookers were filled with glee to see their friends met in this manner by a man who did not look the part. Then somebody put the light out, and by the time it was relighted most of the hazers had crept to their bunks and the 'green Canadian' was quietly smoking and sitting on the edge of his bunk. Not a word was said, nor was there a word said at breakfast the following morning. After breakfast the stranger departed as quietly as he had come, and it was sometime before the hazers heard the last of the 'green Canadian.' I have never heard whether the logging firm put up a job on the crew to abolish hazing of the new men or whether that fighter just happened along."—American Lumberman.

## The Fire Hazard in Lumbering

At the recent conference of the Western Forestry and Conservation Association, held at Portland, Oregon, several excellent addresses were delivered on the fire risk in connection with the burning of slashings. Mr. J. L. Bridge, of the Washington Forest Fire Association, in a brief address outlined his views as follows:

Experience during recent years with forest fires shows clearly that the increasing slashing area is one of the most serious problems and one on which there are many opposing views.

The majority of logging operators and timber owners of Western Washington, realizing that this increasing slashing area means a corresponding increase of the fire hazard, are now advocating elimination of this risk by annual burning—the greatest difference of opinion being over the question as to whether spring burning, with its attending possibilities of hanging fires, is desirable.

Fall burning is undoubtedly the safest, but not every fall offers opportunity for doing this work, as evidenced by the season just past. The proper time for fall burning is after the first rains have fallen.

There is usually a time in the early spring when fire will run in a slashing and a fairly good burn result. These spring fires will consume the small branches and other finer material which make the fierce fires. In the course of the last season the State and Association issued about 6,000 permits to burn slashings and incidentally made a great many friends among the settlers, by making

it easier for them to burn according to law. No loss resulted from any of these burnings.

The greatest objection to spring burning and really the greatest danger is that some smouldering fires may be left unquenched by the rains which invariably occur before July 1st, and later be fanned into a blaze.

In our organization we have ten men, known as inspectors, each of whom has direct charge of a district with a number of rangers under his supervision. Experience in fighting forest fires enters largely into the selection of our inspectors and we depend largely on them in this slash burning work. We put these men in the field early last spring, with instructions to examine every dangerous slashing in their district and arrange if possible for their disposal. It was necessary to obtain the consent of owners and, of course, advisable to obtain their assistance. It is a source of no little satisfaction to be able to say that we received the most cordial assistance and co-operation from operators and owners in our efforts along this line. I wish to take advantage of this opportunity to thank them on behalf of the Washington Forest Fire Association for the valuable and material assistance rendered on numerous occasions during the past season, and in numerous ways.

In summing up the work of the past season in connection with the question of slash burning, our experience has made us strong advocates of this method of fire protection. Not every spring or every fall offers favorable opportunity for this work, but when the chance to burn is presented advantage should certainly be taken of it, and fire risks thus reduced. Some say it is not advisable to burn slashings at all and maintain that fire can be kept out of them, but our observation has been that most of them burn sooner or later and it usually happens in the hottest part of the season. Annual burning has rapidly gained in favor during the last two or three years and I feel sure it will continue to win advocates in the next few years of heavy logging operations.

## Disposing of Slashings

Mr. W. D. Humiston, Sec. of the North Idaho Association, also gave an address in which he said:

How best to dispose of the slashings and debris on a tract of land after logging operations are completed is a question which must be determined by several conditions.

This subject must, of necessity, be discussed in generalities before a body representing holdings in widely differing conditions.

Generally speaking, all cut-over land falls into one of two classes: that which will repay clearing for agricultural or other purposes, and that the highest economic use of which lies in raising trees, or in re-forestation.

The lay of the land, climatic conditions, quality of the soil, transportation facilities and proximity of towns all bear on the question.

Several of the operators in the Panhandle of Idaho have put their cut-over lands which are suitable for agriculture on the market within the past year or two, and this action has thrown some light on the matter of disposing of slashings.

One of the first things they learned was that if they show a prospective customer cut-over land on which there was practically nothing but grass, and perhaps a few top logs between the stumps, they could sell the land more readily and at an advance of not less than \$5.00 an acre over land covered with a mass of charred brush and tops from which only the needles had been burned.

In Northern Idaho, at least, brush will not come up rapidly, if at all, on land where the slashings have been burned off.

It is safe to say that only on a very small percentage of the land in Eastern Washington and Northern Idaho which has been logged off up to this time is it good business for the owner or in the best interests of the community to practice re-forestation, as the demand for cut-over and in this locality is so great.

Probably the most efficient, safest and most economical way to burn is at the time logging operations are going forward. This is possible at almost any season of the year throughout the territory represented by the members of this association.

The work is done by the logging crew with comparatively little additional help. Convenient locations for the fires are selected where they will interfere least with the other work and as the branches are cut off the trimmers throw them on the nearest fire.

In Northern Idaho nearly all the large operators suspend operations during the summer season, so that with us, at least, the danger of fires getting beyond control would be small.

In broadcast burning, it is the usual practice to merely leave

the debris where it falls and then burn it at the least expense, regardless of results.

This method has nothing to recommend it on any class of cut-over land for, when employing it, there is no possibility of protecting the reproduction, the humus is destroyed over the entire tract, the danger is tremendous, and, when you are through, you find that in most cases only the needles and smaller twigs have been consumed, and the ground is covered with a mat of charred and tangled poles and limbs. Then, if you did your broadcast burning in the spring, you have a smoldering fire menace all summer in every rotten log or stump which, with the first high wind, is apt to break out, entailing enormous expense and incalculable loss of property.

Brush piles should not be allowed to stand through the winter, especially when there is snow, for they dry out slowly and ice forms under them, which remains until late in the spring, preventing burning until it is extremely dangerous to have fire out.

While conditions differ so widely in the various sections of the timbered empire represented here to-day that few rules can be set down, yet I am sure every one here who is interested in timber or cut-over lands or the welfare of the community will agree that as an investment as well as a protection the careful and thorough disposition of slashings will well repay better methods than have generally obtained heretofore.

#### The Logging Hazard

Mr. A. W. Laird, Potlatch, delivered an address upon the Logging Hazard, as follows:

The Logging Hazard—Why is it and why is it so difficult to control? Why do we hear so much about it these present days?

Lumbering operations as they have been carried on the past century have been practically all conducted in districts where there were no distinct annual wet and dry seasons. Once in a cycle of ten or fifteen years there would come an unusually dry season and fires would do considerable damage and burn considerable timber.

The starting of operations along the Western Coast and in Northwestern states developed new conditions, a rougher country, the scarcity of streams which could be used by loggers led to the use of donkey engines and the hauling of logs by rail. These methods with their sparking tendencies, and the long certain dry season of every summer, brought the logger face to face with a serious hazard.

The logger found himself by force of circumstances, a conservationist, practical. The other fellow up to this time has been a conservationist, theoretical. Both must soon come to a common working basis.

There are other serious hazards besides fire which are constant but the fire hazard is the topic of the day.

Men who have been brought up in the woods or who have learned woods work are by their training reckless and careless of responsibility and inclined to wastefulness, for Nature herself is ever present with him showing him her wanton wastefulness in her own processes.

The logging camp foreman is the man on whom the immediate responsibility rests. He must watch his men and teach them to walk in other ways than Nature leads them. He cannot and will not make them stop smoking, the great solace of the man in the woods. He can try to make them more careful to put out their matches before throwing them on the brushy ground.

The best stack our company has used is the Radley-Hunter Diamond stack. While not absolutely spark proof it is very safe. Track walkers should also be employed during the very dry season, as an additional precaution. Such men have put out many a dangerous cinder.

We have also adopted as a protective measure against the spread of fire, the practice of clearing the brush a strip from 50 to 100 feet wide between the standing live timber and the tract being cut. The brush picked up is piled and burned and thus little is left to cause a rapid spread of fire.

After all is said and done the best plan is to push the logging a little harder in the winter and spring and accumulate enough logs ahead so that all logging operations can cease during the months of June, July and August. With the slashings burned pretty clean during the close season there should be much less fire fighting expense, much less fire hazard and less destruction of timber.

As color blindness is recognized, why should there not be such a thing as knot blindness? That does not seem any more unlikely than color blindness and it may be possible that this exists and accounts for shipments being made and passed by inspectors who are troubled with this failing. Again, it may be stated that an inspector troubled with color blindness would not be able to detect blue sap. It is up to the lumber associations to have their inspectors examined as to their eyes.—West Coast Lumberman.

#### English Trade Flourishing Again

The Board of Trade returns for October show large increases in the value of the exports and imports of the United Kingdom. The returns show increased activity in the cotton, engineering, mining, coal, electrical, carriage-building and other industries, all of which are users of timber of some kind. Most of them use pine and spruce deals freely, while some use ash and oak in fair quantities.

#### Cooperage Trade Doing Well

The Sutherland-Innes Company, Chatham, Ont., report as follows: The apple crop is now over and on the whole it has been a very satisfactory one for the cooperage stock manufacturers, a great deal more stock having been shipped than was anticipated in September. It did not look very good for a while but crops certainly panned out very nicely and there are practically no apple barrel staves carried over into next season. In fact, we ourselves are cutting some apple barrel staves to take care of the winter carload trade.

Elm staves, especially No. 1's, are very scarce and prices on 30-inch staves have advanced from 25 to 50 cents per 1,000 over earlier sales. No. 2 elm staves are also steady and higher prices are being obtained for these than for some time. The demand for gum staves is good and prices are satisfactory to the manufacturer, although they could do with a little more money.

Hoops have eased off somewhat but prices are still very good for this season of the year, and as the consumption is light during the winter months, prices should remain steady on the present basis.

Basswood heading is extremely scarce in the No. 1 grade. Cottonwood heading is also comparatively scarce, but there is still plenty of gum and hardwood heading to be obtained at very reasonable prices. Exceptionally wet weather for the past month has put the woods in the northern district in very bad shape and until there is a freeze up, nothing will be done in the way of logging.

The mills in the South are still cutting to considerable extent and unless very wet weather intervenes, will continue to run for a good part of the winter.

Trade on the whole at the present time is exceptionally good for this season of the year and prices appear to be satisfactory both to the manufacturer and the consumer.

#### Lumbering on the Rainy River

Logging operations in the Lake of the Woods district are now in full swing and it is expected that there will be fully as large a cut taken out this winter as last, which, owing to the quantity of burnt timber was the largest for the past fifteen years.

The Rat Portage Lumber Co. have five and the Keewatin Lumber Co. six large camps, all taking out both saw logs and Tie logs, the combined output of which will be approximately 20 million feet, b.m.

In addition to these two operations J. W. Short has five camps taking out tie timber, R. S. Kindall, Frank Gardner and Hugh Fraser each one doing the same, all of which will be sawn into ties at Kenora and Keewatin during the next summer.

Up to the present weather conditions have been ideal for work in the woods, the swamps and small lakes having frozen early, since which there has been just sufficient snow to make good skidding without at all affecting the log cutting or road making, thus enabling them to get well advanced with these branches of the work before the New Year, after which hauling commences and by which time it is expected there will be sufficient snow and hard frost to keep the main roads in good condition.

Although somewhat scarce at the beginning of the season labor is now plentiful at from \$26 to \$30 per month, but it is to be regretted that the old time lumber jack has apparently passed out of existence.

#### Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing us, enclosing stamped envelope, and stating number of enquiry.

1276. **Wood dowels.**—A Manchester firm wishes to purchase in large quantities from manufacturers only, maple or birch dowels, rods, prefer them in 24-inch, 30-inch, 36-inch, 48-inch. Would like quotations for whatever length or thickness made.

1277. **Hickory dowels.**—Manchester firm will handle limited number of hickory dowels.

1287. **Timber.**—A South African firm of general merchants wishes to be placed in touch with Canadian manufacturers and exporters of timber. Catalogues, prices, discounts, etc., are requested.

1307. **Handles.**—A Bristol firm wants lowest quotations for ash hayfork handles, 4, 4½, 5, 5½, 6, 6½, 7 and 8 feet. Ash manure fork handles, 4 and 4½ feet. Ash bent fitted scythe snaths. Hickory sledge handles, 36 inches. Hickory pickaxe handles 36 inches.

1401. **Unplaned maple strips.**—A London firm report a large opening for unplaned maple strips, 1½-in. x 3-in. x 18-in. and upwards in multiples of 9-in. They would like to receive quotations from Canadian manufacturers.

# Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

A New "American" Grinder—No. 1

## A Convertible Grinding Machine

The accompanying illustrations show three views of a new grinding machine which has just been added to the high grade American line.

The manufacturers call this machine their No. 4 Universal Grinder, and they claim that for a filing room tool it cannot be surpassed.

Cut No. 1 shows this machine as a thin knife grinder with power feed attachment. No. 2 is the same machine with hand feed only. No. 3 is a view of this machine as a cutter head grinder.

When used as a cutter head grinder there is a stand for side heads and an attached double arbor for right and left hand heads, which are secured to the carriage. An adjustable indexing stop holds the heads at various points for grinding the cutters.

Primarily this machine is a matcher or cutter head grinder, but by the use of an independent attachment, which the makers call

A New "American" Grinder—No. 2

their "Plain Knife Clamping Bar," this machine can be converted into a tool for grinding thin steel knives, for which either hand or automatic feed can be supplied. This change can be made in a very few minutes.

For mills desiring a universal grinder, this should prove a very effective tool.

Any further information or a circular regarding the machine may be obtained by addressing the American Wood Working Machinery Company, Rochester, N. Y.

## Unique Cross-Cut Saw Booklet

One of the most attractive cross-cut saw booklets ever issued by a saw manufacturing company has recently been produced by Henry Disston & Sons, Incorporated, Philadelphia, Pa. In the foreword of the booklet the company draw special attention to the fact that they have been in business for over seventy years, and that ever since the foundation of the company in 1840, the demand for Disston brand saws has steadily increased, necessitating, from time to time, the erection of new buildings, employment of additional help and installation of extra mechanical facilities, until now, as for some years past, they claim that the Disston works have become the largest of their kind in the world. This achievement, they as-

A New "American" Grinder—No. 3

sert to be the result simply of having produced "service-giving saws."

All who are interested in cross-cut saws will be consulting their own interest by writing to the company for a copy of this excellent booklet, which contains in the first place a splendid article upon the purpose of the raker or cleaner tooth. This is followed by a series of excellent illustrations of the various cross-cut saws produced by the company, together with price lists. The booklet closes with illustrations and prices of Disston cross-cut saw handles, setting and sharpening saw tools, etc.

## An Excellent New Lumber Rule

The American Rule Manufacturing Company, Nashville, Tenn., have entered the lumber rule field with a product which they have every reason to expect will meet with widespread approval. Their direct aim has been to make an improved rule at a moderate price. They have been aided by the advice and suggestions of many lumbermen and their rule has been designed by lumber inspectors. It embodies their suggestions as to make-up, shape of head and handle. As to its finish, workmanship, quality of wood and metal, accuracy and durability, the company claim that it is without an equal. These rules are made of select second growth white hickory, butt cuts of the log only being used. Each stick of hickory is selected by an expert with over thirty years' experience in buying and handling

hickory. It is thoroughly air-dried, thereby retaining the greatest amount of strength and flexibility.

All the figures on these rules are printed by an original process, which eliminates the danger to the fibre of the wood, caused by the old method, and which for accuracy, it is claimed, will stand the test of a micrometer to the 1/100 part of an inch.

The tip or blade of the rule is of oil-tempered tool steel, double riveted to the brass shoulders, which taper gradually to a feather edge. The pole head is so made as to be practically indestructible, the company guarantee to replace all heads that break or come apart. The shape of the steel is oval, nicely beveled, making an ideal head for the lumber inspector.

The rule is three feet long, including the handle, and is made in two widths,  $\frac{7}{8}$  of an inch and one inch. On one side of the rule the scale is for 12-foot, 14-foot and 16-foot, and on the other side for 8-foot, 10-foot and 18-foot. A rule with 12-foot scale only on each side can be furnished if desired. These rules are sold at \$1.25 each, with a discount of twenty per cent. on one-half dozen lots. The company make a specialty of filling orders by express upon the same day as they are received.

### An Improved Drive Calk

An improved drive calk which, it is claimed, will not work through the shoe and injure the foot or work loose in a soft, wet sole, has been placed upon the market by the North & Pfeiffer Manufacturing Company, Hartford, Conn., U.S.A. So confident are the manufacturers of these calks, that they will prove to be all that is claimed for them, that they have put them on the market with the following guarantee:

"We hereby guarantee our boot calks to be made from the finest quality of steel, adaptable to calks, to be perfectly hardened with scientific precision and uniformity, to be uniform in length,

and exact in workmanship, in short to give complete satisfaction to the user and to be the best boot calk on the market.

"Any of our calks not measuring up to this guarantee will be replaced free of all transportation and other charges, in the hands of anyone, anywhere, at any time. This extends to manufacturers, jobbers, dealers and actual users."

Samples and particulars may be secured by addressing the above firm.

### Carborundum and Electrite Products

The Vincit Company, Limited, manufacturers of carborundum and electrite, 70 Queen Victoria Street, London, E.C., have issued an attractive catalogue of their high class grinding machinery. The catalogue is printed in two colors and contains a vast amount of matter of much interest to all users of grinding machinery.

### Jeffrey Installations

The Jeffrey Manufacturing Company, Canadian Works, Montreal, Quebec, have recently received orders for four rather extensive cable conveyors for the Lake Superior Pulp & Paper Co. at Sault Ste. Marie, Ontario, Canada. Geo. F. Hardy, mill architect and consulting engineer, is furnishing the designs and specifications. The East Canada Power & Pulp Co. have also recently ordered Jeffrey equipments.

### The Parsons Turbine in Canada

Mr. J. P. Stockbridge who represents C. A. Parsons & Co., of Newcastle-on-Tyne, builders of the Parsons turbine, is visiting various parts of Canada in the interests of this turbine which has a wide application for driving generators, ventilating fans, etc. Mr. Stockbridge has recently been engaged in the installation of many large Parsons turbine plants in Australia. One of the principal results of his present visit to Canada has been the placing of the sole Canadian agency for these turbines with the Robb Engineering Co., Ltd., who will also manufacture certain parts. The Robb Engineering Co., Ltd., having various district offices in the principal cities of Canada, are widely known as contractors for the complete equipment of central power stations, collieries, steel works, etc.

### Mule-Hide Roofing a Ready Seller

The Dominion Roofing Company of Canada, Limited, with head office at Toronto, are pushing their Mule-Hide Roofing very effectively among the lumber dealers of Canada. This is a malthite asphalt roofing which is put out under a ten-year iron clad guarantee and is proving a tough and durable roofing with a splendid lasting and resisting power. A new and novel proposition is being offered to the dealer by this company which is helping greatly to increase its business. Mr. Earl R. Malthy the general manager, is a firm believer in co-operation with the dealer in the pushing of sales and has inaugurated a service which is free to every dealer handling their roofing and which not only pushes the sale of roofing in the locality in which the dealer is located, but also pushes in every home the sales of the other lines carried by him. A two-cent stamp sent in an inquiry will repay the lumber dealer.

### Handling of Lumber

We very often hear it said that the lumber we get nowadays is poor stuff and that it is a shame the way the millwork "they" send us warps and checks and misbehaves after being put in place. If the truth could be known, however, the fault is usually not with the millwork, but with the way we treat it—or, rather, mistreat it. This is particularly true of doors; and the higher quality they are, the more they resent improper treatment.

A prominent Chicago lumber company, realizing this, sends out with every order for millwork this card of warning, instruction and advice:

"Read Carefully! All wood is porous, and the drier and more thoroughly seasoned it is, the more readily it absorbs moisture and is affected by climatic conditions. For instance, when an unfinished hardwood door is placed in a damp room it quickly absorbs the moisture in the air, consequently expands or swells, and when it returns to normal condition (that is, when the moisture is all dried out), the door is warped and twisted all out of shape, the joints open, and it takes much time and work to repair the damage. This could easily have been avoided if only a little precaution and care had been exercised in the handling of the door.

"Be sure your building is thoroughly dried out before any interior finish is put in. Mortar, as you know, contains large quantities of water, and until the moisture has dried out of the walls the house is not fit for occupancy; neither is it in the right condition to receive hardwood doors or any other fine woodwork quickly affected by climatic conditions, and the manufacturer should not be blamed if the product upon which every care is exercised in the making is not handled properly upon arrival at building.

"Where possible, it is always well to have artificial heat to help dry out the building before any interior woodwork is put in. After doors are hung and no more 'fitting' is to be done, it is an excellent plan to cover the ends of the stiles (both top and bottom) with at least one coat of paint or varnish. This will prevent moisture from entering the 'end pores' of the wood. If the above hints are carried out, we guarantee that finish manufactured by us will stay where it is put, and the doors will not shrink or warp."

This is along the right line. Carpenters and builders find it to their special advantage to see to it that extra care is taken to protect their materials on all jobs so that permanent satisfaction may be had.

The Hoyt Metal Company, manufacturers of Babbitts of all kinds, have moved into their new factory on Eastern avenue, Toronto, which will enable them to more than double their previous output. With factories at New York, N. Y.; St. Louis, Mo.; London, Eng., and Toronto, Canada, the company markets annually over \$5,000,000 worth of mixed metals. Mr. G. F. Allen is general manager of the Toronto business.

### Of Interest to Lumber Buyers

The attention of our readers is directed to the advertisement of W. C. Edwards & Co., Limited, of Ottawa, appearing on another page of this issue. They are offering the trade a choice line of stock on which it would pay those interested to secure quotations. This large firm have thoroughly up-to-date facilities for manufacturing and handling stock which ensures the consumer reasonable prices, quick shipments and satisfaction all round. Readers of the Canada Lumberman would do well to write to W. C. Edwards & Co. when looking for stocks of good lumber.

The annual export of Christmas trees began this year earlier than usual; thousands of young spruce, cedar and pine trees are being shipped to the large American cities. A year or two ago efforts were made to discourage the wholesale cutting of these young trees, but apparently the demand from the United States and the tempting prices offered weigh more heavily with farmers than the thought of conserving their young trees.

# WANTED & FOR SALE DEPARTMENT

## PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

## WANTED-LUMBER, ETC.

Wanted to buy a quantity of green standing Maple. Apply M. Brennen & Sons, Hamilton, Ont. 1-1

### Wanted

Ten cars 1 in. and 1½ in. Dry Soft Elm, log run. Apply Box 370, Canada Lumberman, Toronto, Ont. 23-2

### Basswood, Elm and Maple

Wanted—a quantity of one and two-inch basswood, elm and maple. R. W. Baxter, Chatham, Ont. 24-1

WANTED—5 x 5 White Maple, second growth, dry, 5 to 10 years old, for bowling pins. Address, M. J. Bernhard, 712 to 720 Jefferson Street, Buffalo, N. Y. 1-4

Two-inch Soft Elm wanted, immediately, several cars, dry. State quality and prices. Great Lakes Lumber Company, Limited, Owen Sound, Ont. 1-4

### Basswood Wanted

WANTED—inch No. 2 common and mill culls, winter cut Basswood. Apply Firstbrook Box Company, Limited, King street east, Toronto. 22-25

### Lumber Wanted

Have you any stock which you wish to sell? If so, make the fact known to probable buyers by placing an advertisement in the Wanted and For Sale Department. Address Canada Lumberman, Toronto.

### Wanted

two carloads 4-inch firsts and seconds, Hard Maple, dry, 6 inches and up wide, 10 ft. and up long, for immediate shipment. Quote price and point of shipment to Box 360, Canada Lumberman, Toronto, Ont. 22-1f

### Wanted

500,000 feet 4 in., 4½ in. and 5 in. Birch Firsts and Seconds for shipment as soon as sawn, green or dry. Quote best price on cars, giving amounts you can furnish. Box 353, Canada Lumberman, Toronto, Ont. 22-5

### Wanted

Five million feet of maple, birch, basswood, ash, oak and elm, 1-in. to 4-in. thick, for delivery during 1912 at Owen Sound, water shipment only. Can use log run. Advise what you have to offer, giving lowest prices. Our terms are spot cash on delivery. Box 388, Canada Lumberman, Toronto, Ont. 21-3

### Wanted Box Lumber

Large consumer of No. 1 and No. 2 White Pine Box Lumber, desires to negotiate with responsible shippers, regarding stock for water delivery next season. Give shipping point, state quantity 4-4 and 5-4 can furnish with lowest quotations and other particulars. Address, Box 374, Canada Lumberman, Toronto, Ont. 23-2

## White Pine Logs Wanted

Wanted, sound, green, white pine logs (small second growth preferred) for immediate or winter delivery. State what quantity, where they are, and price by piece or by the thousand. Write The Wm. Cane & Sons Co., Ltd., Newmarket, Ont. 22-1

## Birch Wanted

We want to buy Birch in all thicknesses. Log run or on grades. Will contract for winter's cut. National Lumber Company, Buffalo, N. Y. 23-2

## Maple and Rock Elm Wanted

Wanted—Up to 120,000 feet 1-in. and 1½ in. hard maple 6 in. up wide, 10 ft. up long; also 20,000 feet 1-in. and 1½-in. rock elm 6-in. up wide, 10 ft. up long; quote price for 1sts and 2nds and also No. 1 Common grades in each case and name point of shipment to Box 382, Canada Lumberman, Toronto, Ont. 24-1f

# Hardwood Wanted

3,000,000 feet Hard Maple, Soft Elm, Rock Elm, Beech, Birch, Basswood, Ash, Oak, and Soft Maple, for delivery, shipping dry during 1912. Sawn to our sizes. State what you have to offer and lowest prices for spot cash. Inspection at mill. Apply Manufacturer, Box 401, Canada Lumberman, Toronto, Ont. 1-8

## FOR SALE-LUMBER, ETC.

### Cedar For Sale

Square Cedar for sale; 1,000,000 to 2,000,000 feet, for next winter and spring delivery. Auger & Son, Quebec, Que. 22-1

### For Sale

1-in., 1¼-in., 1½-in. and 2-in. mill cull White Pine in strips and sidings. Fred T. Smith, Board of Trade Building, Montreal. 1-1f.

# We Want a "Want Ad" From YOU

☐ Just an opportunity to prove to you what a quick purchase or sale you can make by advertising in this department.

☐ The page is before you—read what the other fellow wants, or has for sale.

## Canada Lumberman and Woodworker

Toronto - Canada

## 12 in. x 12 in. For Sale

300,000 feet B.M. of 12-in. x 12-in. short leaf yellow pine timbers 18 ft. to 40 ft. average 30 feet. Can ship immediately.

JAMES SHEPPARD & SON,  
Sorel, Que. 24-3

## Hardwood For Sale

We are prepared to cut under contract:—250 M. to 500 M. feet Hard Maple, 100 M. to 200 M. feet Basswood.

Also some Black Ash, Birch, Soft Elm. Correspondence invited. The Pearce Company, Limited, Marmora, Ont. 22-1f

## Shingles

500,000 M. pieces Rathbun's XX-18-in. Cedar Shingles. To introduce this shingle to the trade, we are offering them for one-half their value. \$1.00 per M. pieces F.O.B. cars Deseronto. The Rathbun Company, Deseronto, Ont. 1-4

## FOR SALE-MACHINERY, ETC.

### For Sale

Good boiler, 72 inches by 14 feet, 72 4-in. tubes, 75 h.p. engine and 100 light dynamo. All in good condition and ready for immediate delivery. Will accept lumber in exchange. Apply to Box 400, Canada Lumberman, Toronto, Ont. 1-4

### For Sale

One fifty horse power tubular boiler complete with front, grate bars, injector and smoke stack, and one thirty-five horse power engine, together with steam pipes and heater, for \$250, f.o.b. cars. For particulars apply to C. H. Sheppard, Waubaushe, Ont. 23-2

### For Sale

One Gang Circular Sawing Machine (Kendall patent) good as new; run only 18 months. This machine carries nine 32-inch saws, takes from 4 to 10-inch cants, can be set to cut one to three inch stock.

Reason for selling, cut out. For price, write Jas R. Gillies, Arnprior, Ont. 24-5

## Equipment You Can Swear By, Not At

16 miles 56 lb. relay rail with angles, gross ton \$25.00.  
25 standard gauge 60 M. capacity log cars, guaranteed, \$175. (Located near Toronto, duty paid).  
42 Ton Shay, 10 x 12 cylinders, standard gauge, Port Arthur, \$3,500.  
31 Ton Shay, 10 x 10 cylinders, standard gauge, guaranteed, \$2,300.

### JONES PURCHASING AGENCY,

## WANTED-MACHINERY, ETC.

### Wanted

WANTED—One double ward hoop planer, one wheel lapper and pointer in good repair. Address Box 2, Heathcote, Ont. 24-24-1

## WANTED-EMPLOYMENT

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

Position wanted as filer in a factory where there are band resaws. First-class references. Box 366, Canada Lumberman, Toronto, Ont. 24-1

First-class band and band resaw filer experienced in box factory and saw mills. References. Box 383, Canada Lumberman, Toronto, Ont. 24-3

Commission salesman calling on Ontario trade, would like a connection with good manufacturer or dealer in Pine and Hemlock who can fill orders. Box 377, Canada Lumberman, Toronto, Ont. 23-1

If you want an employee for any branch of the lumber or woodworking trade the best, quickest and cheapest way to get him is by placing an advertisement on this page. Canada Lumberman and Woodworker, Toronto, Ont.

WANTED—Position as bookkeeper with lumber firm in Ontario. Twelve years' experience, mostly as office manager; age 34 years. Acquainted thoroughly with all departments of lumber office. Best of references furnished on application. Apply Box 399, Canada Lumberman, Toronto, Ont. 1-8

Advertising Manager—Of a large manufacturing concern of Cleveland, Ohio, desires to connect with a going house who are looking for results in advertising. Is competent of writing own copy, compiling of catalogues, folders, circulars, etc. For further information address Box 384, Canada Lumberman, Toronto, Ont. 24-1

## WANTED-EMPLOYEES

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

Young man to take charge of office in town on Georgian Bay. One with some experience in lumber trade preferred. State age, salary expected and references. Box 397, Canada Lumberman, Toronto, Ont. 1-2

WANTED—Hardwood lumber buyer; must be experienced and capable of grading in accordance with National Hardwood Rules. We want a high-class man and will pay accordingly. Box 380, Canada Lumberman, Toronto, Ont. 24-3

## BUSINESS OPPORTUNITIES

Partner wanted, sleeping or active, with \$10,000 to manufacture small articles from hardwood. I have a 10-year contract in my pocket for all I can produce. 50 per cent. profits, unlimited quantity of suitable timber. Don't answer unless you have the cash. Box 378, Canada Lumberman, Toronto, Ont. 24-1

### Wanted

A manager for a saw mill in Northern Alberta, must be prepared to take stock to the amount of \$10,000, or one having a saw mill with a capacity of from 50,000 to 60,000 a day who wants location; timber will last 15 or 20 years. Manager to take full charge from stump to market. Apply Box 369, Canada Lumberman. 22-1

### Business Opportunity

WANTED—A man with \$15,000 to \$20,000 to buy and run a mill business in the Province of Quebec, on the seashore. About \$6,000 will pay for the machinery, the mill site, dwellings, sleighs, trucks, belts, etc. Balance of capital to be employed to buy each year 40,000 to 50,000 logs or more. Lumber may be exported by vessels to England or United States, or by rail to the United States. A wharf 400 feet long will be built in the locality by the government and could be contracted. Tenders asked; also for sale fine pulpwood land free from restriction, for exportation to United States. For particulars, apply to Box 346, Canada Lumberman, Toronto, Ont. 1-1

**Timber Limits For Sale**

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont.

**Sales Agents Wanted**

Large British firm with plants in England, Bohemia and France manufacturing Carborundum and Electrite goods and high class grinding machinery wants to secure either first class salesmen or firms with established trade connections to represent them in Canada. Apply Box 384, Canada Lumberman, Toronto, Ont.

**For Sale**

Up-to-date Circular Saw Mill, going concern, 15,000 to 20,000 capacity; In good shape. House and stables, tools and utensils of all kinds, 300 acres of bush land, railroad connection. Much timber can be bought. This is worth looking into. Will be sold cheap. Write Jones Brothers, Katrine Station, Ont.

**Wanted Mill Connection**

Old established New York State manufacturer controlling extensive and desirable trade in spruce, hemlock and white pine, desires to make a permanent mill connection with a Canadian manufacturer to handle output or will consider proposition to buy yearly output, all or part. Address reply to Box 381, Canada Lumberman, Toronto, Ont.

**Canadian Timber Limits****E. STEWART (Forest Engineer)**

Dealer in Timber Limits, Ontario and Western farm lands and town property. Excellent investments now open. Correspondence invited. 84 King Street East, Toronto. Phone Main 5609.

**For Sale**

Established Lumber Business, with first-class mill, now running full time. Timber limits with 20 to 30 million feet of standing pine timber conveniently located, and all merchandise, etc. Price \$55,000. This is worthy of investigation. Address Box 332, Canada Lumberman, Toronto, Ont.

**For Sale**

170 ft. 1 in. good basswood short, 2 to 5 ft.  
11 M. ft. 1 1/4 in. good basswood short, 2 to 5 feet.  
14 M. ft. 2 in. good basswood short, 2 to 5 feet.  
50 M. ft. 1 in. M. C. Ash.  
50 M. ft. 2 in. M. C. Ash.  
GEO. C. GOODFELLOW,  
Montreal, Que.

**For Sale**

Sawmill and Shingle Mill in active operation and thoroughly equipped with A1 up-to-date machinery in first class condition. Timber on all sides. Exceptional opportunity; \$1,600 cash, \$1,600 in 6, 12, 15 and 18 months. Can secure eighty acre cut of virgin timber, thirty yards from mill if desired. Write D. McNair & Son, Whitewood Grove P. O., Ont.

**A Going Lumber Business**

In the Republic of Panama

We offer for sale at a very low figure, one of the choicest mill and timber propositions in the Republic of Panama. It is a going proposition and consists of mills, railroad and equipment, logging outfit, buildings, boat, barges, etc., and a tract of the finest hardwoods to be found in that country, which will cut from 1 1/2 to 2 billion feet. This proposition is located on navigable water. The entire cut can be contracted at good prices. This proposition is worthy of attention and will stand the closest investigation. Shall be glad to furnish further data on request.

J. W. ROBINSON,  
Wells Building,  
Milwaukee, Wis., U.S.A.

Satisfaction guaranteed

A. T. FRAMPTON, Victoria, B. C.

**Match Making in Sweden**

The match industry is one of the most important in the Kingdom of Sweden, and has grown rapidly. Twenty factories produced matches valued at \$3,422,000 in 1909. Nine-tenths of the total product is exported. These Swedist matches are encountered all over the world, despite a very keen competition. The export interests complain of the high protective duties in most countries. In France, Spain, and Greece matches are a Government monopoly.

The Swedish factory equipment contains many devices for replacing manual labor. Lagerman's "complete machine," introduced in 1892 at the Jonkoping works, is one of the most ingenious labor-saving devices known. The match splints, already cut into the proper form by other appliances, are fed regularly into one end of this machine and emerge at the other end a finished product, packed in boxes, ready for shipment. One such machine produces hourly 3,600 boxes of matches.

Aspen wood is used almost exclusively in the match industry. It is easy to cut and porous enough to admit easily of impregnation with sulphur or paraffin. The domestic supply of aspen of good quality is now seriously reduced, and much is imported from Finland and Russia. Most of the chemicals used—phosphorous, antimony, sulphur, and paraffin—are imported. This was also formerly the case with potassium chlorate until the recent establishment of the Swedish electrolytic manufacture. In 1901 the Swedish Government forbade the sale in the Kingdom of matches made with yellow phosphorous. At present the manufacture of the old-fashioned matches is much less than formerly, although the Jonkoping works produce a considerable quantity in which yellow phosphorous is replaced by innocuous phosphorous sesquisulphide. In manufacturing the standard safety matches of Sweden now the splints are first soaked in paraffin, or in a concentrated solution of ammonium phosphate. The ignition mass for the heads consists of potassium chlorate, mixed with sulphur or antimony sulphide, gum, or dextrin in solution, and small amounts of powdered glass and ferric oxide. Potassium dichromate and manganese dioxide are occasionally added as oxidizers. The friction surface on the boxes is coated with a mixture of red phosphorous, antimony sulphide, and dextrin solution.

The largest factories in the Kingdom are the two at Jonkoping and the "Vulcan" at Tidaholm. Under their lead nearly all the other manufacturers have combined to prevent undue competition and facilitate the export trade. This latter is carried on

largely through Hamburg and London, which serve as distributing points for much of the world's trade in matches.

**Walnut for Gunstocks in England**

A number of attempts have been made by prominent English gun manufacturers to obtain walnut from the United States for gunstocks, but the wood has invariably been found unsuitable for the high-class guns, and it has not heretofore been used for guns of poor quality. The difficulty is not in the strength of the wood, but in the color, which is dark brown with none of the yellow and light-brown streaks that are found so attractive for gunstocks.

The walnut that has been used for British gunstocks has come from Italy, Switzerland and France. It is said, however, that the last tree suitable for gunstocks in Italy has apparently been cut so that the supply is now French, but the prices for the French walnut are going up so high that they may within a few years become prohibitive. The French walnut is now particularly in demand for veneering purposes, it being found more profitable, as a rule, to cut it for veneer than to sell it for gunstocks. Thus it is quite likely that a situation will develop where American walnut gunstocks will be in demand.

It is highly desirable that prices be quoted in English money and the walnut delivered in Birmingham, or at least delivered at a British seaport.—From Consul Albert Halstead, Birmingham.

**Working Up Low-grade at the Saw Mill**

The best way to attack the poorer grades of lumber at the saw mill, particularly those which are not worth transporting a reasonable distance to market, is to manufacture them into a higher-priced product, which is profitable in spite of the increased freight rate of the manufactured over the raw material. It was through the application of this principle that the great wholesale sash and door works have been established, enabling all of the manufacturing waste to be eliminated at the plant, transportation charges being paid only on the finished product, whose weight is rarely over one-fourth that of the equivalent rough, green lumber.

It would seem that in a similar way a profitable business might be worked up in standard varieties of "knock-down" frames. It would be possible to standardize into a dozen or so types and to manufacture the stock into large quantities, machining on semi-automatic frame machinery and racking same ready for orders. In

this way a mixed order of frames could be sorted out, crated in a solid bundle, one frame to the bundle, ready for immediate shipment. It would seem that this might afford an outlet for lumber of short and unmerchantable sizes that would be worth investigating. R. M. C. in the Wood-Worker.

**Lumber from Paper**

J. B. White, chairman of the executive committee of the National Conservation Congress, who recently returned to Kansas City from a trip through the Eastern States, has been investigating the possibilities of manufacturing lumber from paper. "So nearly perfect is artificial lumber made from paper," he said, "that there is no longer cause for great worry over forest conservation. Furthermore," he continued, "a superior quality of artificial lumber can be manufactured cheaper than natural lumber can be grown. Taking 57 per cent. waste paper, 22 per cent. straw, 5 per cent. jute, and 15 per cent. wood fibre, a ton of fibre board, one-fourth inch thick, or 1,100 feet of inch lumber, can be produced."

**Inefficient Belt Service**

How long should a good composition wire belt lace, properly put in, last under the average running conditions? It is my candid opinion that many factories are continually hampered by shut-downs and belt troubles through the lack of sufficient care in this very essential particular. Some one in every factory should be given the care of the belts, and be supervised and instructed until dependence can be placed upon his ability. When this is done, better results and more uniform and longer service may be expected. At the present price of belting, which shows no immediate sign of diminishing, longer and more efficient service is well worth the trouble involved.

M. W. M.

**Imitation Mahogany**

More than half of the 40,000,000 feet of "mahogany" consumed every year in the United States is not mahogany. There are a score of imitation woods, but one chief one. The so-called Colombian mahogany, according to a monograph just issued by the forest service, belongs to the monkey-pod family, *Lechytigaceae*, otherwise known as *Cariniana pyriformis*. Its grain and color resemble the wood of mahogany, and its straight, cylindrical trunk, averaging three feet in diameter and with a clear length of 50 feet, admirably adapts it for lumbering. The cabinetmakers like it, as well as the true mahogany. Why not call it by its true name *Cariniana*?

# Review of Current Trade Conditions

## Ontario

Lumber trade conditions in Northern Ontario show a decided improvement in every way over those of a year ago. As compared with November, the prices in December showed a tendency toward a slight advance. Stocks among the inland mills are now very light and moving well. No. 2 and 3 Pine lath are very scarce, the demand during the past season having been phenomenal. This is owing to these grades being used so extensively in the cheaper grades of construction. The demand for No. 1 Pine and Hemlock lath is not so great but prices for these are firm. The mills along the North Shore have still large stocks on hand, but these are now moving and conditions even here compared with last season are much improved.

Among many of the Northern firms there will be a curtailment in this winter's woods operations. While the whole cut will perhaps not be less than last year's, still there will be no important increase in quantity. The principal reason for this seems to be the bad condition of the United States market.

With the Christmas season on, and stock-taking to be attended to, it was not to be expected that the lumber trade would show any great activity during the last two weeks of December. In spite of this, however, travellers report that they met with a fair amount of business and that prices as a rule were well maintained. The long continued soft weather was accountable for this, as it permitted building operations to continue much later than usual. Outside of this feature of the situation there is not much to say about trade conditions. Building operations throughout the province may be said to have pretty well come to a close now, and retailers are only purchasing what they actually need. The old habit of buying extensive stocks at the beginning of the year has practically disappeared and retailers now buy what they want, when they want it. As the demands of the building trade are so limited at this time of year, the retailers accordingly have not much incentive to lay in stocks. This condition is likely to continue till the opening of Spring buying, though, after the inventories have been taken and the retailers have a fair idea of just where they stand, a little more activity may naturally be expected.

The hardwood trade in Ontario has been of fair volume for this time of year. Previous to Christmas there was a good enquiry and in fact right up to Christmas the enquiries kept up better than they ever did before at the same time of year. Nearly all items in the hardwood lines are pretty close to the saw. A well known manufacturer, discussing the situation, stated recently that if he were to be asked to name any drug on the hardwood market to-day he would be unable to do so.

## Eastern Canada

Almost every class of lumber has been enjoying an exceptionally good demand during the early winter period, on account of the open weather, which has permitted the continuance of building operations. A prominent Montreal dealer reports that there has been no let-up in business and the demand is extraordinary for this time of year. On account of making preparations for stock-taking, some of the yards are not now ordering as much as they have been but on the whole this has had little effect upon business. There has been a good movement of hardwood stocks of which chestnut and birch flooring have been the features. The outlook for the spring trade is also considered good, on account of the certainty that there will be a continuance of the extensive building operations.

The Boston market for eastern spruce is improving and prices are showing a firmer demand. Retailers show no inclination to buy for future use, but the demand is fair. Reports are frequent that an early advance of 50 cents a thousand is probable. The asking prices for frames is \$24 to \$24.50, and it is difficult to buy at the lower price for immediate delivery. Sales for prompt delivery have been reported at \$25. There is a good demand for random and prices are steady. Shingles at Boston are firmer. The best cedar extras have brought \$3.65, but sales are still reported at \$3.60. Clears are steady at \$3.20 to \$3.30. There is a fair demand for lath. The asking price for 1.5/8 inch ranges from \$4 to \$4.15 and for 1.1/2 inch from \$3.50 to \$3.55. There is only a small demand for hemlock boards at Boston. Manufacturers' stocks of eastern clipped boards are fairly large, but they are showing no inclination to sell in a hurry. Eastern clipped boards are quoted at \$19.50 to \$20, but the top price is rare.

At New York, orders for eastern spruce are increasing and inquiries show more variety. The outlook is considered encouraging. Local stocks are not large and the yards show an increased inclination to anticipate their spring requirements. The demand for hem-

lock boards is better at New York and the prices are fairly firm. The assortment of local stocks is about the same as it was a month ago. Yards are not showing much tendency to anticipate their wants.

## Western Canada

The logging situation in British Columbia is reported weak, with large stocks in salt water. The dull condition of the lumber trade is indicated by the decrease in the amount of logs scaled in November, 1911, as compared with November, 1910. The figures were 42,000,000 feet, while in the same period a year ago they were 60,000,000 feet. Trade with the Northwest and to foreign ports is dull, though local trade is fair. Conditions, however, are not deterring some companies from beginning operations. Perhaps it is because timber owners want to realize, for at the final sitting of the Taxation Commission in Vancouver, L. A. Lewis, manager of the Brunette Sawmills, New Westminster, expressed the opinion that because of heavy taxes those who controlled natural resources could not conserve them, and the government was rendering void its own policy. He suggested that where the government receives a royalty the lumber affected should be exempt from the personal property tax.

About two hundred million feet of logs are reported in the water, but the number of camps operating is comparatively small. Prices range about \$9 to \$11.50 for good camp run of fir. Cedar is in fair demand at from \$9 to \$10.50 for lumber logs and about \$7.50 for the shingle logs. Spruce is scarce and in little demand, price about \$9. Hemlock sells at about \$6. Logs that will go say 35 per cent. clear and not more than 5 per cent. number three are selling at Vancouver at \$10.50. A few booms may be picked up at \$8 and \$8.50 that will run about merchantable. Association prices are \$6, \$9 and \$12. The weather in Manitoba was mild during much of December and much work was done in finishing buildings. Farmers did not do much fall building on account of the lateness of the harvest and the threshing season, but in December they bought small lots of lumber for repair work. Retail lumber dealers did not order very heavily from the mills during the fall. In the cities and towns, however, the year's business has been satisfactory apparently. Indications for next spring are unusually favorable. Stocks at country yards are not large, and the demand when spring opens up is expected to be heavy.

While collections have not been as satisfactory as the wholesale and retail merchants hoped, a large amount of money already has come in from the country. Threshing, as already stated, was later than usual, and consequently marketing of the grain was delayed, especially after the traffic congestion in November set in. The wheat output of 1911 in Western Canada was by far the largest in the history of the country. Its value also was much ahead of the aggregate high prices for even the lower grades, of which there is an enormous quantity on account of frost damage.

## Great Britain

The lumber trade at London has settled down to a winter basis and little important activity is expected until the buying for the new year commences. Stocks in most of the important lines are shorter than they were a year ago and there is a prospect of better prices. At present, prices are steady and firm. There is a scarcity of sound deals and planks and they are bringing high prices. Considerable criticism is heard of the quality of the deals and planks which have been sent by White Sea shippers during the past year or two. Clean shakey deals are too plentiful and are of no use. There is an improvement in several sizes of battens, and a shrinkage of 25 per cent. in the piled stock of floorings is making them stiffer in price in the face of a continued strong demand. For the week ending December 2nd, deliveries at the London Docks totalled 5227 standards as compared with 5629 in the corresponding week of 1910.

At Foy Morgan & Company's recent auction sale 3 x 11 3rd dry Quebec Pine sold for £15 15s. for 11/12 and 13 ft. A parcel of St. John Spruce sold at £5 10s. for 1 x 3.5/23.

At Liverpool, the close of the year found the demand for wood goods of most descriptions nearing its minimum as is usual at this time of year. Retail buyers are only in the market for such stocks as their actual requirements make necessary. The close of the season for shipments of spruce deals has resulted in an improvement of prices. A few shipments will arrive by liners from St. John, and Halifax and are expected to bring higher prices. A cargo from St. John is reported to have been sold at £8 10s., or better, c.i.f. to the west coast. There is a fair demand on the spruce spot market, but it is confined to actual requirements. The indications are that the trade during the coming year will be much better than it was a year ago. If these prospects are in any way realized there will be a considerable depletion of stocks before the opening of next season.

# BEAR IN MIND

That we saw all winter and have large stocks of Norway and White Pine for immediate shipment.

ALSO

**HEAVY CONSTRUCTION TIMBER,  
SHIPBUILDING TIMBER,  
RAILROAD TIMBER.**

The above timber can be cut to order up to 60 feet in length from Pine or B.C. Fir.

We aim to maintain the supremacy of "Cleveland Sarnia Quality".

**Cleveland-Sarnia Sawmills Co., Limited**  
SARNIA, ONTARIO

A. F. HOLDEN, Pres.  
F. H. GOFF, Vice-Pres.

J. M. DIVER, Gen'l. Mgr.  
E. C. BARRE, Ass't. Mgr.

There is a firm spot market for birch and the demand is steady and moderate. Stocks of logs are fair but the stock of planks is small. The c.i.f. market for birch is also firm and there is an upward tendency both for timber and planks. Offerings are light. American quartered oak is selling well. Prepared maple flooring is steady.

The close of the season at Manchester finds the stocks in a very healthy condition from the importers' and shippers' point of view. Statistics seem to indicate strongly that the low water mark for the timber trade was reached in 1910 and that from 1911 onwards a period of good trade is certain. Prices are very firm. Spruce scantling are strong at £8 5s. ex quay with other sizes in proportion. There is considerable stir in the building trade and several large undertakings are being planned for the new year.

Little change is reported from Glasgow. The general demand continues on a satisfactory basis and orders have been rather more numerous of late. There is still however an unpleasant amount of price cutting. With the conclusion of arrivals from Quebec it has become evident that a serious shortage in some of the staple lines is probable. Yellow pine deals are scarce especially in the better qualities. Quebec elm is selling at a premium and recent sales have made new high records. Supplies of waney pine timber and oak logs are also low and have advanced in price. An improvement is noted in the spruce market. Prices however are unchanged.

#### United States

In spite of the unsettled financial and political conditions in the United States there continues what may be generally characterized as a fairly satisfactory demand for lumber for consumption. It is still evident however, that in some sections of the country there is only an intermittent demand with irregular prices and small margins of profit. Buying in general is only for immediate demand without any disposition apparent to lay in stocks for future use. The December trade was about on the same level as that of November, which was better than that of the preceding months. In the northern pine trade the present season is one of activity in the woods rather than in the trade. The soft weather which has prevailed so far has given rise to reports of a probable shortage in the log camp. As yet however, it is too soon to make any definite predictions along this line, as one so frequently finds that early indications of reduced operations in the woods do not materialize. It may be said however, that the indications in favor of a reduced cut were seldom more pronounced than at present.

Chicago:—The yard trade has suffered as usual on account of the holiday period. The local consumption has continued, but the demand for retail yard stocks is quiet. During the past year there has been nothing more noticeable than the general disinclination to buy stocks for future use. There are plenty of enquiries turning up however and as soon as the inventory season has been passed it seems probable that there will be a fair trade revival. Lumber receipts for the week ending December 16th were 43,845,000 feet, against 46,809,000 feet for the corresponding week of the previous year. The total receipts for the year up to December 16th showed a decrease of 407,320,000 feet compared with the corresponding period of 1910. The total shipments for the same period showed a decrease of 165,904,000 feet compared with 1910. There is a fair demand for mixed car lots of northern pine and some good inquiries have developed for pattern lumber and box material. There is a fairly good trade in hardwoods and frequent inquiries are made for deliveries in January and later. There is a scarcity of stocks of dry lumber in the upper grades of the more important hardwoods. Prices are firm and there is an encouraging improvement in the general market. Plain red oak is active and there has been a little more activity in the demand for quarter sawed. There is a fair movement in white ash. The lower grades of basswood are active. Birch and maple are in good request. A good trade in hemlock is expected during the winter. Higher prices are expected for southern pine within the next month, as a result of better inquiries and the reported broken nature of stocks at mill points. The demand for red cedar shingles is quiet. Prices are strong. Lath are firm and selling well. The market for cooperage stock has been quiet with a lower tendency.

New York:—The demand for northern pine is improving and the retail yards are more active. Orders for straight cars are limited but a good general business is being done in mixed cars. Competition is strong for immediate shipments, but wholesalers are diffident about accepting current prices for orders far ahead. Hardwood stocks are reported low in city yards, and inquiries are brisk. Prices are strong, but the nature of the demand is not all that it might be, as buyers want immediate delivery and their shipments are rather of a mixed variety. Quartered oak is rather slow, but plain oak, maple and ash are moving well.

Buffalo:—The better grades of northern pine continue scarce and are bringing good prices. Box lumber is firm and a little higher. The demand for pattern makers' stock is strong. An increase in the demand for hardwood is evident. Quartered oak is stronger.

Plain oak and maple continue in good demand. Hemlock prices are firm and dealers expect them to continue so. The consumption of hemlock is large. Shortleaf pine is firm and is expected to continue so throughout the winter. The same conditions prevail in the market for longleaf pine. The demand for red cedar shingles is quiet and large supplies are available.

## Market Correspondence

### Brisk Lumber Trade at Montreal

Montreal, Dec. 23rd.—The open weather has had a good influence on local trade, and, having regard to the time of the year, there has been an exceptionally brisk demand for almost every description of lumber. Contractors have been able to continue outdoor work, and have been buying in fair quantities. As one dealer expressed it, "There has been no let-up in business, and the demand has been extraordinary considering the season." Some of the yards have been making preparations for the usual stocktaking, and naturally have been inclined to reduce stocks, but on the whole, trade has been satisfactory. Hardwoods have been moving freely, with chestnut and birch flooring as features.

Prospects for next year are generally considered to be excellent as there is certain to be a continuance of the extensive building operations, judging from the reports of property sales and contemplated work.

It is claimed by some that the recent soft spell will be a good thing for the woods, as it put the lakes and streams in a better condition for the piling up of logs. On the other hand, the absence of snow will greatly interfere with hauling, with a consequent shortage of lumber and higher prices.

Water conditions are now good, so far as Eastern Canada is concerned, but this cannot be said of the State of Maine. The production of ground wood and news paper is now at its maximum in the States, although there is not much new business passing. As the weather gets colder, the streams will close up, lessening the water supply, and gradually curtailing production. The present good water powers will enable the paper mills throughout the continent to make their full production, and the consumption of various kinds of pulp will thus be greatly stimulated. Authorities claim that in 1911 a better business in paper and pulp was done than for any period in the last decade, and 1912 promises to be even better than the last 12 months. The stock of news paper in the United States is decreasing at the rate of 5000 tons per month.

The low water conditions in Scandinavia continue and a mechanical wood famine is said to be certain. Prices are now many dollars higher per ton for any available ground wood. Sulphite in Scandinavia commands two dollars more per ton, and chances are that prices will advance further. The effect of this scarcity is being felt in Canada and the United States, and as much as \$3 advance per ton has recently been paid for Canadian sulphite.

It is stated that a Canadian mill has just contracted for 15,000 tons of ground wood for a year from next spring; the mill had previously manufactured their own ground wood, but have had to buy, owing to exceptional circumstances. A large New England mill has also contracted for 15,000 tons of ground wood from a Canadian mill. There is a considerable tonnage due in the early part of 1912 from Canadian mills, owing to new installations, but this will be readily absorbed in consequence of the strong demand. During 1911 the American continent was easily short of 30,000 tons of mechanical wood pulp.

Some interest has been taken by Canadian mills in the discussion at Washington as to what action Congress will take over section 2 of the rejected Reciprocity Bill, but the result will be received with indifference, as Canadian wood, water power, pulp and paper will readily command a market irrespective of any tariff action.

The S. E. Carss Lumber Company, Limited, Orillia, Ont., have taken over the business of the Tait-Carss Lumber Company, Limited.

The McGibbon Lumber Company, Penetanguishene, Ont., have made a very happy selection of an illustration and design for their calendar for the year 1912. The calendar mount is of a soft light brown color and the illustration is a splendid colored reproduction of a painting by E. Roscoe Shrader, entitled "Breaking the Jam." The picture shows a couple of husky lumber jacks at work on a huge jam. They are putting their efforts into the releasing the key log. Their intentness and coolness in the face of imminent peril are excellently depicted. The calendar is one which will have an especial appeal to all lumbermen.

### Prairie Trade Review of the Year 1911

The year 1911 in western Canada was a disappointing one in many respects in the prairie lumber trade, speaking in a general sense and as a whole. The entire volume of sales has not been nearly so great as was generally believed would be the case. The demand during the Spring and Summer reached a fair average but during the last three months of the year the bottom dropped entirely out of the country trade and at a period in which it was believed business would be most favorable the contrary proved to be the case.

At no time for a number of years have country collections been so unfavorable as during the latter three months of 1911. The inability to move the grain and get the returns for it has left the farmers in a position where, as a rule, they are unable to buy more lumber or to pay for what they had bought earlier. Money in this connection has been very tight throughout the entire fall season and these arduous conditions are now only commenced to grow easier.

The grain was several weeks late in ripening, the threshing season, late as it was, was very unfavorable and the cold weather of mid-November were elements which all tended to make up a most unfavorable situation. The railway facilities proved entirely inadequate to the task of moving the grain with even a reasonable promptness and the result has been the financial stagnation in the lumber business as described above, in common with other lines of trade. The whole situation throughout the year hinged, as is always the case, upon the success of the harvest, which being in many important respects unsuccessful, the culmination has been such that the year will go down in history as a poor year in the lumber business in the west.

A redeeming feature of the situation throughout the year was the activity of retail trade in the cities. This activity was most prominent in the larger centres, such as Winnipeg, Regina, Calgary, Saskatoon and numerous other rapidly growing cities and towns. Building at such points has been very active and retail buying of lumber consequently very brisk.

Prices throughout the year have been in a somewhat unsettled state in the markets of the prairies. Changes of an important nature have been few but values have ranged below the normal. The importations of American lumber to the prairies has been responsible for the instability of prices in wholesale circles and as a consequence retailers have bought at figures considerably below the average in many of the principal lines. Dealers who handle coast and mountain products exclusively have found it hard to keep prices

up to the average level in the face of the competition of the output of the American mills and the meeting of the schedules offered by the latter has been responsible for much of the instability of the markets.

Competition in the lumber trade has been quite as keen as ever before, despite the increasing of the scope of the market and the increasing opportunities to sell lumber. In a few cases price wars were carried on for short periods in some of the smaller towns. There has been little real competition from mail-order houses although country dealers have been obliged in many cases to cope with quotations from such sources. The results have been more in the nature of inconvenience and trouble for the yard-man rather than any material loss of business. Generally speaking, little difficulty has been experienced in selling lumber in the face of the figures submitted by the mail-order houses.

A feature of the year has been the rapid increase of sales territory on the prairies due to the large number of new branches of railroads which have been opened for traffic. The line-yard companies have shown their ability to keep abreast of the development in this line as the prompt opening of one, two or three yards in even the smallest of the new towns will testify. The number of new yards opened has been very large.

The year 1911 had many favorable elements bearing upon the trade in general and the prairie trade in particular. Immigration was heavy, building in all lines in the cities was very brisk, the railroad expansion was all that could be described,—there and other conditions all tended to make the year a prosperous one but the unusual combination of circumstances and conditions with the crop brought the year to a close in the midst of conditions that could not be called other than unfavorable.

### Is the Wooden House A "Cheap" House

In the campaign against "substitutions for wood" vigorous effort should be made to down once for all the idea that the wooden house is a "cheap house." Not cheap in the sense that it costs less to build, but when built it will look cheap. This idea is effectively worked by the substituters for wooden building materials, and as they have worked almost without opposition from the lumberman this idea has had a wide growth in the past few years, says the Southern Lumberman.

The fact is that wood frame construction has recently been used but little except for the less expensive buildings, and the home build-

## Makes It's Mark Vivid and Lasting

Marks that remain vivid and wear like iron are a real satisfaction to the man who handles lumber. The metallic pigments, like graphite, of DIXON'S LUMBER CRAYONS offer marvelous resistance to all kinds of weather conditions. Their marks are often visible after six months of severe exposure to sun and storms.

### DIXON'S LUMBER CRAYONS

have always remained the recognized standard because of their one, uniform and dependable quality; their convenient and uniform shape and size and because of the careful selection of materials used in their manufacture. DIXON'S LUMBER CRAYONS are made in nineteen grades and colors, including black (six grades), red (two grades), blue (two grades), green, white, yellow, brown, terra cotta, violet, pink and orange. Some are made to fill particular needs—let us tell you more about them. Get acquainted.

### Wistar Underhill & Co.

Real Estate Trust Bldg., Philadelphia, Pa.

Canadian Rep. - W. J. Anderson, 288 South St., London, Ont.

er, when he intends to spend on his residence as much as four thousand dollars or more gives but little thought to the possibility of his building a better house, a more attractive one if the building's outside is of wood. Led by his architect and influenced by the custom that prevails about him he figures on brick or stucco and studies the woods only to decide upon the character of the interior trimmings. Had that same builder worked with wood as the basis, he could for the same money have built not only as good a house, but certainly in each case a more pretentious one and one more artistic. Some of the country's most stately anti-bellum houses were frame, and most of these are holding their own with houses of the same age built of other materials. Where the families who owned these frame mansions have taken an interest in them and given them the proper care they are to-day the same attractive houses, showing that durability is not the problem.

To-day, in most of our cities, the competitor of wood as the material for residence construction, where the builder wants a house less expensive than of brick or stone, is stucco or cement. The cement block house has seen its best days, and it seems the secret of the flimsiness of stucco cannot long be held away. Its present popularity is due to the fact that the builder wants something else than wood, under the misguided belief that his house will give a "finer appearance." A lumberman has only to point to any of two houses of the same age, standing as long as ten months—one built of stucco and one of frame—to carry his point with any intelligent builder. The stucco house is just as expensive to keep fresh with paint, and when it cracks, as it surely will, it is not capable of repair except at a heavy expense. There has been no one working to point out such facts.

Pictures and plans of homes built of wood—not only small houses and cheap bungalows—these too, but houses that would range in price from \$1,500 to \$15,000, could be left to good advantage for lumbermen in the offices of architects, where the prospective builder could use them as tips on his construction. Such tips is something that every experienced builder is searching for, and the booklet could show a range of modern architecture not possible in other materials.

### Ontario's 1910 Lumber Cut

Ontario still produces a little over one-third of the quantity of the lumber cut annually in Canada, but its annual cut, while increasing, is increasing more slowly each year. Ontario's 1909 cut was 17 per cent. greater than in 1908; its 1910 cut was only 7.5 per cent. more than in 1909. The Forestry Branch of the Department of the Interior has compiled statistics showing that 1,642,191,000 feet of lumber worth \$30,011,000 was cut in Ontario during 1910, but that British Columbia will be Canada's premier lumber province in a short time. The diversified forests of Ontario have enabled this province to hold its supremacy up to the present, as illustrated in 1910, when the chief cut of seventeen species came from Ontario. White pine to the value of \$17,743,074 came from Ontario forests and formed 85 per cent. of Canada's white pine cut. Nearly half of the hemlock cut in Canada in 1910 was cut in Ontario, as was over 90 per cent. of the red pine. Ontario contributed over 70 per cent. of the hardwoods. Of the total made up by twenty-three species cut in Ontario, over one-half was white pine. Red pine contributed 10 per cent., hemlock 12 per cent., leaving 25 per cent. to be equally divided among the hardwoods and less important conifers. To arrive at the correct amount cut by lumber mills of Ontario in 1910, there must be added to the above lumber cut, 1,976,000,000 shingles worth \$3,557,211, and 851,953,000 lath worth \$1,943,544.

The annual convention of the Western Retail Lumbermen's Association will be held in Winnipeg the second week in February, at the time when the annual "bonspiel" is held.

It is estimated that the Turtle Mountain forest reserve, if properly stocked with oak, would yield some six million feet of timber of that species per year—a quantity not lightly to be passed over when it is remembered that all the oak used by the woodworkers of Manitoba (the agricultural implement and vehicle manufacturers of Manitoba alone used, in 1910, 1,835,000 feet of oak) had to be imported.

The Appleton & Sewall Company, Foresters and Surveyors, of 156 Fifth Avenue, New York City, owing to numerous inquiries relative to timber land holdings have established a timber land department in connection with their other forestry work and at present are making a specialty of buying and selling Maine timber land about which they have valuable data and information. They have for sale some valuable lands along the St. John and Allagash rivers in the northern part of Maine, which is undoubtedly the future timber section for that state.

## Nearly 7 Times as Much Steam Delivered from Every Ton of Coal

By the use of J-M Asbesto-Sponge Felted Pipe Covering as high as 6 4-5 times as much steam has been delivered from every ton of coal as when the pipes were left bare. And about 1 1/3 times as much steam has been delivered as when ordinary coverings were used.

This is proven by a series of disinterested tests conducted by Mr. Geo. H. Barrus, the well-known engineer, on the basis of 100 pounds pressure and up, 10,000 square feet of surface.

This big saving of fuel has also been proven by the many users of

### J-M Asbesto-Sponge Felted Pipe Covering

The Elkins Coal & Coke Company, Morgantown, W. Va., recently wrote that J-M Asbesto-Sponge Felted Pipe Covering saved them \$307.20 the first two months. At which rate the covering would pay for itself in less than five and one-half months.

Tests made by prominent engineers show that steam at 350 degrees F., through pipes insulated with J-M Asbesto-Sponge Felted Covering, can be carried over a mile, through a temperature of 60 degrees F., with a loss of only 10 H. P. (or 2.65%) of a 375 H. P. engine carrying 120 pounds steam.

J-M Asbesto-Sponge Felted Covering is as full of air cells as a sponge. And—due to the laminated construction—every one of these air cells is sealed. Thus an enormous amount of dead air—the greatest of non-conductors—is confined in this Asbestos covering. That is why this covering permits so little of the steam to be wasted through condensation.

Write our nearest branch for booklet "The Insulation of Pipes and Boilers."

## EDGINGS

### Ontario

Pickard & Jermyn, of Wiarton, Ont., have dissolved partnership. David Conklin, Kingsville, Ont., is building a new sawmill to replace the one recently destroyed by fire.

A. E. Pickard and H. W. Jermyn, lumbermen and sawmillers, Wiarton, Ont., are reported to have dissolved partnership.

An explosion recently destroyed the engine and sawmill outfit belonging to Fred Elliott, at Embro, Ont. A new outfit will be procured.

The city of London, Ont., is contemplating the purchase of woodworking machinery to the value of \$5,000, for Technical School equipment.

The saw and grist mill and general store of H. N. M. Chene, St. Andre Avelin, Ont., has suffered loss by fire. The damage is covered by insurance.

The Seaman, Kent Company, Limited, Meaford, Ont., intend to erect an addition costing \$10,000 to their hardwood flooring plant at Fort William, Ont.

Snyder Bros., Waterloo, Ont., are erecting an addition to their furniture factory. The new building is to be three storeys, 158 x 55 feet, and to cost \$15,000.

Mickle, Dymont & Company, Brantford, Ont., will erect an addition to their planing mill, for a moulding shop. Woodworking machinery may be required by the company.

The Montrose Paper Mills, Ltd., Thorold, have prepared plans for a new machine room. They intend to install one paper machine, six boilers, and washers with necessary screens, tanks, etc., two rotary boilers, finishing machinery, cutters and calenders.

R. W. Nicholson, Strathroy, Ont., intends to erect a woodworking factory two storeys, 50 x 60, for the manufacture of kitchen cabinets, screen doors, windows, etc. The town has carried a by-law to authorize a loan of \$12,000 for the purpose of assisting the industry.

The Imperial Pulp & Paper Mills at Sturgeon Falls, Ont., have been purchased by the Dominion Bond Company for \$900,000. The industry will be re-opened and run in conjunction with the Spanish River pulp and paper mills at Espanola, seventy-five miles distant. The plant originally cost \$1,500,000.

The Board of Control of the City of Toronto have recommended that the city either purchase direct or expropriate the planing mill property of the Dunn Lumber Company, which recently suffered a serious loss by fire. The property adjoins the Aged Men's and Women's Homes and the Industrial Refuge, and was considered a source of danger to the lives of the inmates.

Mr. John T. James, of Bridgeburg, Ont., has purchased from Mr. W. H. Crawford, of Orillia, a sawmill and considerable hardwood timber near Whitehall, about fourteen miles west of Scotia Junction. The mill contains a 50 h.p. boiler and 45 h.p. engine and has a capacity of from 16,000 to 20,000 feet a day. He has also purchased four hundred acres of timber land at Scotia Junction. It is his intention to erect a small store at Whitehall. The timber consists chiefly of birch, with some maple, beech, spruce, balsam and cedar.

### Eastern Canada

Allen & Ross, Sherbrooke, Que., have been registered to carry on a lumber business.

The sawmill of Dalton Brown, at Bolton Glen, P. Q., is reported to have been destroyed by fire.

The sawmill belonging to A. Cloutier, Rimouski, Que., is reported to have been destroyed by fire.

Landreville & Huard's sash and door factory, Montreal, P. Q., is reported to have been destroyed by fire.

The sash and door factory of Landreville, Heard & Company, Longue Pointe, Que., has been destroyed by fire.

The sash and door factory of the Kent Lumber Company, Granby, P. Q., has been damaged by fire. The loss is covered by insurance.

An American syndicate is considering the erection of a sawmill at Smiths-ville, N. S., Antigonish County. Walter Dixon, Smiths-ville, is the manager. The building will be 100 x 85 feet.

P. Dussault & Company, La Patrie, Que., have registered to carry on a lumber and real estate business. The firm is composed of Messrs. P. Dussault, H. Vincent, N. Edgar, G. and L. Lussier.

The sash and door factory of Michael Bruneau & Son, Granby, P. Q., is reported to have been purchased at auction by Arthur Barre for \$6,300. Mr. Barre intends to continue the operation of the factory.

The Edward Partington Pulp and Paper Company, of St. John, N. B., has secured a suitable site and next year, according to present plans will erect a news print mill in that city. The new location adjoins the company's pulp mill.

The Dominion Lumber Mills at Black River, N. S., were recently destroyed by fire at a loss of \$8,000. The mills were owned by an American syndicate. W. Dickson was manager. It is reported that the company will rebuild.

Parisean Bros., 419 Mitcheson street, Montreal, are erecting a box factory to cost \$20,000. The building is to be 200 x 100 feet. The company are in the market for band saws, planers, shaving blower, dry kiln, and 175 horse power engine.

The Sydney Lumber Company, who recently purchased the Bearinger and Chapin mill at Dalhousie, N. B., have under consideration the erection of a factory for the manufacture of nail kegs in conjunction with the nail plant at Sydney.

Saguenay Mills Limited, Montreal, Que., have been incorporated with a capital of \$20,000, to own and operate sawmills, timber limits and deal in lumber, wood, pulp and timber of all kinds. The incorporators are J. S.

P. Morgan, Wm. G. M. Morgan, of Sorel, Que., and E. Maurault, of Montreal, Que.

A Fredericton, N.B., despatch states that W. H. Gunter has purchased the Babbitt Estate mill at St. Mary's, N.B. Mr. Gunter is also reported to have sold his interest in the Richards Company's business on the Restigouche to the Stetson-Cutler Company.

The D'Auteuil Lumber Company, Limited, Quebec, have been incorporated with a capital of \$50,000, to buy, sell and deal in lumber, pulp and timber of all kinds, operate power plants, saw mills, etc. The incorporators are C. E. Taschereau, J. P. Cantin and U. Gelly, all of Quebec.

Wm. Rutherford & Sons, 425 Atwater Avenue, Montreal, will build an extension to their box factory at Levis and Duvermay streets. The extension is to cost \$4,000 and to be of three storeys, 40 x 80. They will also build a lumber shed costing \$2,000 on Atwater avenue, two storeys, 52 x 180.

The Dominion Mahogany and Veneer Company, Lachine, Que., have awarded a contract for the erection of a wood veneer factory to cost \$75,000. The building is to be two storeys, of concrete construction. The company are in the market for an engine and for planing and edging machines. The general contractors are F. J. Jago & Company, 626 Coristine Building, Montreal. Messrs. E. & W. S. Maxwell, Montreal, are the architects.

Tenders are being received by the Deputy Minister of Marine and Fisheries, Ottawa, until noon of January 15th, for 40,000 cubic feet of round white pine timber and 10,000 feet of round yellow spruce in the log, in accordance with the specification prepared by the department, to be delivered at Sorel, P. Q., not later than July 31st next. Specifications can be obtained from the purchasing and contract agent of the department and from the Director of the Shipyard, Sorel, P. Q.

The property recently purchased by Percy C. Black and others from Chas. Davidson Hill, of Truro, N.S., is reported to have been taken over by the Maple Leaf Lumber Co., Ltd., which has been organized with a capital of two hundred thousand dollars. Percy C. Black has been appointed president; I. J. Soy, manager; Edgar Fillmore, R. M. Embres and E. L. Milner, directors. The company own about thirty thousand acres of lumber lands situated near Folleigh and North River. It is estimated that there are about 150 million feet of lumber on the property, chiefly spruce. The company expect to cut about six million feet this season and a much larger quantity next season.

### Western Canada

The Hillman Lumber Company, Limited, has been incorporated in British Columbia with capital of \$10,000 and head office at Vancouver.

The Gibson Lumber Company's mill at Pingston Creek, B. C., is reported to have been destroyed by fire. The loss, amounting to \$100,000, was covered by insurance.

The Acme Lumber Company, Limited, Vancouver, B. C., has been incorporated with capital stock of \$10,000 to carry on business as timber merchants, sawmill proprietors, etc.

The Hillman Lumber Company, Limited, Vancouver, B.C., has been incorporated with capital of \$10,000, to carry on business as timber merchants, sawmill proprietors, etc.

The Westholme Lumber Company, Westholme, B. C., have secured the tender for the construction of the Sooke Lake waterworks for Victoria, B. C. Their tender was for \$1,169,720.

United States capital is behind the Dominion Match Company, which is erecting a factory with thirty-six machines at New Westminster, B.C. This is the first of its kind in the Canadian West.

The T. A. Burrows Lumber Company has been incorporated at Winnipeg with a capital of \$500,000. The incorporators include Frank Carlisle, W. J. Chalk and Marshall Anderson, all of Winnipeg.

A standard logging railway will be built by the Canadian-Puget Sound Lumber Company from Jordan river to Sooke harbor, a distance of twenty miles. If a favorable location is secured, a mill will be built on Sooke harbor.

The Brittingham & Young Company, Limited, Vancouver, B. C., has been incorporated, with a capital of \$50,000, to operate timber lands, timber leases and carry on business as lumbermen, saw, pulp and shingle mill proprietors, etc.

The Lombard Investment Company, Winnipeg, has been incorporated by F. W. Louthood, B. S. Jenkins and George A. Dysart, all of Winnipeg, with a capital of \$100,000, to carry on a general land, mining and lumber business.

The Carman Manufacturing Company, 615 Hastings street west, Vancouver, has been incorporated, with a capital of \$100,000, to operate sawmills and conduct a general lumbering plant, etc. J. N. Ellis, of Vancouver, is attorney.

The McLelan Lumber Company, Ladner, B. C., report that they are still open for tenders for general contracts and machinery for their sawmill at Ladner's Landing. The head office of the company is at 744 Hastings street west, Vancouver.

The Similkameen Fruit Land Company, Limited, Winnipeg, Man., incorporated, with a capital of \$1,000,000, to carry on the business of lumbering in all its branches, manufacturing brick and tile, etc. The incorporators are Wm. T. Alexander, D. J. Taylor, and R. Langtry, all of Winnipeg.

A fire recently occurred at the sawmill of the Canadian Pacific Lumber Company, at Pingston Creek, Arrow Lakes, B. C. The flames spread to a slab pile from the refuse burner and completely wiped out the mill and yards. The damage is estimated at \$75,000. The manager of the company is Mr. Rand Gibbons.

Bloedel, Stewart & Welsh, who recently acquired 7,800 acres of timber from T. L. Shevlin and 4,000 acres from the Gulf Lumber Company, will log their product for sale in the open market. They will install a standard gauge railway from Myrtle Point, near Van Anda, to its limits. Later the company may build a mill.

The Dominion Match Company, 328 Hastings street west, Vancouver, B. C., are contemplating the erection of a plant at Vancouver. The company control the patent for making matches out of woods such as alder, cottonwood and spruce to be found in British Columbia. Subsidiary companies may also be established in Eastern Canada. R. Thompson is the secretary-treasurer of the company.

## The Barnhart Log Loader

has been in successful operation in all parts of the country for twenty years and never caused a complaint. We are now manufacturing a new Barnhart Loader known as Model "12," which is specially designed for use in very heavy timber. This loader is built on the same lines as the old Barnhart Loader now known as Model "10" and which we still continue to manufacture. We are operating lumbermen, producing 200,000,000 feet of lumber per annum and we use the Barnhart Loader exclusively. Could we afford to do so if it were not the best? Write us for prices.

**Goodyear Lumber Company,** BUFFALO, N. Y.

We have a splendid stock of

**WHITE PINE  
RED PINE  
SPRUCE**

Enquiries solicited from the  
wholesale trade.

# TO YOU

On this, the beginning of the New Year we tender a hearty greeting with our sincere wishes for your continued prosperity.

Your interests, as users, and ours, as manufacturers, are mutual and we take this occasion to express full appreciation of the trade you have given us.

On our part we shall spare no effort or expense necessary for the maintenance of that superiority of Quality, Workmanship, Design and Efficiency, which has been so characteristic of Disston Saws, Tools and Files, thus meriting a long continuance of your orders.

Yours very truly,

## Henry Disston & Sons

## Go and see the new BERLIN fast-feed matcher in operation

The mill is the laboratory in which the durability of a matcher is shown. A year's run will disclose more weaknesses and show the need of mechanical efficiency more clearly than any testing out the manufacturer could give.

And the great improvements made in the wood-working field today are due to our initiative in the direction of fast-feed machines.

### Pioneering

When we brought out the first fast-feed matcher ever built, a howl of skepticism rose up.

Competitors scoffed, and most lumbermen didn't believe a word of our advertising.

We told then as we tell today, the absolute truth in our announcements.

The first fast-feed matcher was the "94." It produced a better quality of work than other machines and at double the rates of feed.

Yet the "94" as compared with the latest Berlins is like the automobile of today and that of several years ago.

It paid its way. The hundreds and hundreds installed were gilt-edged investments. Yet we have been blamed because the "94" wasn't developed **twice** as fast as anything else in the machinery world.

### Further developments

After we had proven that a hundred foot feed was practical, the other makers of wood-working machinery clambered into the race.

Patents don't always protect and it didn't protect us then or now. If you notice mech-

anical construction you will find our improvements being adapted regularly.

Take the Berlin round cylinder head for example. In the first one we built, the screw which held the gib in place against the knife, passed through a portion of the head itself.

The principle was wrong. We replaced every head we had out. Yet that same style of head is being sold you today on other machines.

The Berlin cylinder head of today is the only durable head offered the buyer. It can't wear out. It's almost one solid piece. Ask any user.

Go and see one of the latest Berlin matchers in operation. And look carefully at the head construction. Compare it with others.

### Testing side heads

We soon found out that fine cylinder work must also be followed by equal side-head production.

A new head department was organized. Our pin type twelve bitted matcher heads were developed. The expansion feature was invented.

Today we have the only complete line of fast-feed side-heads in the world. There's the special ship-lap heads, matching heads, double tongue and groove heads—a complete line.

If you are unfamiliar with the completeness of our side-head line, let us send you a copy of a new booklet, 48-page, "Berlin Heads and Specialties."

Let us mail it to you. It tells the reason for the quality of our side-head work.

### The feed drive

From thirty gears, we have descended to almost none. On the latest Berlin fast-feed matcher there is but **five**.

Our frictionless chain drive is by far the most successful matcher feed works drive today. Its life is as yet unknown.

The Diamond chain runs smoothly and without perceptible wear. We used the chain drive on our No. 108 Moulders for the last eight years. We have never replaced a chain.

Competitors say "it will wear out." We leave it to your judgment. Certainly, it will stand ten times the strain we put it to.

Fire engines, motor trucks, of 60 H. P. and better, racing cars of 200 H.P. use the Diamond Drive and it is used for heavy duty.

The chain drive does away with all complications. Shavings don't stick. And we'll guarantee the wear. That's the last thing we think of.

### The result

The result of our years of experience in the fast-feed field is shown by the volume of our business.

We have created and put out more improvements than all other makers combined. Our line is high-grade and medium priced.

The results show in our latest machines. Go and see them in operation. Notice the profiling attachments and its simplicity.

Be sure and notice our line of heads. Go and see a machine. Ask us where you can see one running.

## The Clark Heavy Duty Saw Mill Machinery

Includes Among Its Leaders

### The Clark Heavy Duty Pneumatic Trimmer

Saw frames are perfectly balanced.  
And telescope for tightening belts.  
Cylinders are double acting.  
And cushion at both ends.  
Pistons packed with double snap rings.  
Saw arbors are extra heavy.  
And suitable for 30 to 34 inch saws.  
Arbor pulleys carry 8-in. belts.  
Machine trims stock 10-in. thick.  
Built with any desired length of table.  
And any number or spacing of saws.  
Variable feed furnished when desired.  
Countershaft bearings are adjustable in both directions.  
Keyboard lower saws independently or in any desired group.  
A single lever lowers every alternate saw or raises all saws at pleasure.  
Steam coils or steam connections are provided for all styles of keyboard.  
This prevents ice formation at exhaust, an invaluable feature.  
The above type of machine is also equipped with single acting cylinders.  
We also build under cut trimmers controlled by pneumatic power.  
For complete details and illustrations of the several types see our trimmer catalogue.

We build every machine required in an up-to-date high service Band or Circular Mill.

# IMITATION is the sincerest FLATTERY

## Plain Facts No. 2

The Number 77—capacity, speed of feed, and many details—has been imitated by all competitors. This would sound like boasting if it were not the truth. If the average mill-man were not acquainted with the facts, we would be cautious in making the assertion.

It is true and we are proud of it.

We are proud of another thing, too—the trade knows the difference between the *genuine* and the *imitation*. There was a time when some manufacturers thought they could make the mill-man believe that a new number made a new machine—we have never resorted to such a trick.

The No. 77, of course, is a better machine to-day than it was three years ago when it first came out, but that is no reason why we should put a new number on it; or give it a new name—no more reason than for you, because you are older to-day and advanced beyond what you were yesterday, should change your name from Smith to Jones or vice versa.

Mr. Mill-man, you are wise to the No. 77; you know what it is; you know the difference; let the other fellow “string” you if he will—you can smile when you think of the No. 77—*smile complacently*.

If it should happen that you have been too busy all your life to give much attention to our ads, or to our literature on the No. 77, we shall gladly furnish you information, if you will send us your name to be put on our mailing list.

*Write us direct, or our nearest selling office.*

## Forest Maps

The mapping of timber lands is recognized as a most important piece of work by Pulp Companies and timber land owners, in the economic handling of wild lands. We furnish topographic maps which show fifty-foot contours, or actual location of streams, ponds, lakes, roads, trails, and any other natural features of importance.

Accompanying this map is a so-called "Timber Map," showing in colors the distribution of timbers found. These maps, together with the detailed report and estimate, afford the owner of lands an intelligent system for the handling of same.

La Compagnie de Pulp de Chicoutimi  
Chicoutimi, P.Q., Canada,  
August 23rd, 1911.

Gentlemen:—

Replying to your favor of August 11th, would say that we have no objection whatever to your using the name of this company with reference to the quality of your work.

After a careful examination of the maps and reports which were the result of your work on the two hundred odd square miles in question, we take pleasure in complimenting you on their accuracy, neatness and generally satisfactory character.

With best wishes for your success in the future,

Yours very truly,

GEORGE C. W. LOW,

Manager Woodlands Department

Messrs. Appleton & Sewall,

156 Fifth Avenue, New York.

We are PRACTICAL FORESTERS, make forest surveys, timber estimates, and abstracts, showing character and quantity of available timber, indicating the most approved methods of cutting each year, so that there shall be no unprofitable depletion, and appraise for present and future worth. Our Booklet F, "Applied Forestry," will be of interest to you. Mailed upon request.

We are pleased to refer you to H. S. Ferguson, Engineer, 200 Fifth Avenue, New York City; Kathdin Pulp and Paper Company, Boston, Mass.; Bonne Terre Farming and Cattle Company, Bonne Terre, Mo.; Chicoutimi Pulp and Paper Company, Chicoutimi, P.Q., Canada.

**No. 300 Heavy Duty Inside Moulder**

The advantages of a Moulder and a Planer and Matcher are combined in the machine illustrated above. Ease and speed in adjustment are insured through special unique features, not contained in any other type of machine. The method of lubrication is perfect. The general construction is after the plan of the planer and matcher, having heavy sides connected by heavy girths which in combination with a series of platen plates form the bed.

**No. 300 Heavy Duty Inside Moulder**

The special features of this model machine include truing devices for top, bottom and side heads, which insure all knives doing an equal amount of work. Six speeds are furnished through friction feeds. Top rolls are made with pull-out shafts, and extra rolls are supplied, all interchangeable. Matcher frames swivel, ample expansion for all bars and chipbreakers. Made in two sizes 15 x 6 and 12 x 6.

# REDUCE COSTS and INCREASE PROFITS

Every lumber manufacturer should have a planer that will produce flooring of the highest quality at 200 FEET and UPWARDS per minute. It enables you to meet competition and enjoy good profits.

**THE PLANERS OF WOODS** have a productive capacity limited only by mill arrangements and ability of labor to handle the stock. When equipped with our **Automatic Feeding Table** any feeder can keep them filled.

The  
Planers

## INDUSTRIAL LOCOMOTIVES

Persistent specialization, careful testing of all materials and painstaking care in manufacturing have produced our standard locomotives for logging operations and switching around industrial plants.

These locomotives are the product of engineers and manufacturers who thoroughly understand conditions surrounding their use. These conditions require powerful and sturdy locomotives which will give maximum work for minimum attention. It is important that the boilers should be ample in capacity

and that they should be tight and remain so. Also that the machinery should be rugged for service with ample surfaces for wear. Parts that will wear should be accessible for easy renewal.

Our standard locomotives embody these features, combined with wide experience. To do yourself justice you should investigate them before purchasing.

Spare parts that are sure to fit are always on hand for prompt shipment.

**B**Y doing perfect work of this kind, (No. 117 Siding) at 200 feet per minute, the "Three-Double-Three" with profiler, is proving itself to be "The New Speed King." Heretofore the best record on No. 117 Siding was 150 feet. The efficiency of the high speed planers is now beyond doubt. The question now is—"Which is the *most* efficient?"

We can demonstrate to you both theoretically and practically, that the "Three-Double-Three" is at least 25 per cent more efficient than any other planer and matcher now made. Give us a chance. Special pamphlet and sample of this siding worked at 200 feet per minute, **FREE** upon request.

**Butterworth Foundry, Limited** Ottawa, Canada.

# MAPLE LEAF SAWS

The Improved Racer Cross Cut Saw, by Actual Test, is the Fastest and Easiest Cutting Saw Made

The Maple Leaf saw is higher priced than the ordinary saw because it costs more to make it. It is made of the very highest quality of steel and tempered by a secret process which toughens and refines the steel. The Maple Leaf trade mark on the saw means that it is the equal, if not superior to any saw made. It also means that you are privileged to test it against any other make and if not found equal or superior in quality you can return it and have your money refunded.

The ambition of the manufacturers of the Maple Leaf Saws has always been to produce the best tempered saw in the world and they are constantly investigating and experimenting with this end in view. They have recently made some valuable discoveries in evenness of temper. It has always been difficult to get a perfectly even temper on long and thin sheets of steel, such as saws are made of. Our recent discoveries make this an absolute certainty. Every user of saws should bear in mind that the temper of the saw is its most valuable quality. High finish and attractive appearance amount to nothing if the temper is not right.

All Maple Leaf Saws are Guaranteed to be Perfect in Temper

96"

between frames

32" — 2 saw edger for portable or light stationary mills

**T**HIS edger combines more of the important points in the machine, than any other edger of its size on the market. It can be made to suit either a right or left hand mill, by taking out four bolts and turning the top of the machine around, which does not disturb the mandrel. The top rollers are self raising, and raise towards the rear of the machine. This makes it impossible for boards to fly back out of the machine. The end bearing may be removed, which allows the saws to slip off the end of the mandrel, without disturbing it in any way. There is a top roller, which is convenient for passing boards back over the top of machine.

FULL SPECIFICATIONS ON APPLICATION.

CROW'S NEST PASS LUMBER CO.,  
WARDNER, B.C.

# STEEL PLATE WORK

**T**O make a success of building Steel Plate Work, in which practically every job is entirely new and of special design, it is absolutely essential that everyone connected with it—from the designing engineer to the boiler-maker—is up-to-the-minute in his particular field, and further, has more than a little practical experience to back him up.

It is the kind of work that tests out a boiler shop. WE MAKE A SPECIALTY OF IT.

At present we are getting out a catalogue of 24 pages showing some of the difficult jobs we have handled in the last few years.

The 1911 extensions to our shops have placed us in a better position than ever before to do this special work. Our facilities in every department have materially increased—we have the men, the equipment and the experience—and for this reason we are going after this kind of work instead of waiting for it to be put up to us.

We attach a list of plate work that we are turning out every day. If you are interested in getting anything along similar lines, send us your sketch, and we will be glad to quote.

# Edgers for Medium Size Mills

Our "Star" Edger has been designed and built specially for mills of medium capacity where a first class edger is wanted, but where it would not be economical to put in one of our larger and heavier "Garland" Edgers.

The frame is all cast iron of heavy section, the mandrel is large and stiff. The Edger has a heavy press roll behind saws and the fingers in front prevent the lumber coming back. The feed rolls are corrugated and made of steel and are driven. In fact this edger is as well constructed throughout as the edgers of larger capacity. It is in no sense a portable edger, but is built for the most exacting requirements.

**Made in all sizes up to 40 inches**

## BARTRAM BROTHERS, Limited

ED. T. SAXE, 200 Claremont Ave. MONTCLAIR, N. J.

OTTAWA, CAN.: Hope Chambers

## 440 Square Miles Timber Limits on Georgian Bay

to be Sold by Private Sale in Large or Small Blocks.

On account of their President and Principal shareholders being engaged in other large enterprises, and not having the time to give to them all, THE PARRY SOUND LUMBER COMPANY, Limited, offer for Sale all of the timber lands, mills and town property situated in the Town of Parry Sound; also Tug Scow and full Camp Equipment for five camps, including boom chains, snow plows, sleighs, etc.

### THE LIMITS TO BE SOLD

comprise some 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, \$1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

## JOHNSTON RE-SAW is a Lumber Saver and a Money Maker

The advantages of this machine over all others are:—1st—As a lumber saver, using 10 and 12 gauge saws; 2nd—Can be set instantly to cut lumber from ½ inch to any thickness up to 4 inches; 3rd—Has screw adjustment so that thickness can be varied 1-12 of an inch under or over standard thickness; 4th—Automatic adjustment to prevent saw from burning by slivers catching; THE FRAME being heavy is very rigid, so that saws can be run at high speed without vibration; THREE POINT driven: Three return live Rolls 8 inch by 20 inch automatic feed: Two grooved Rolls 8 inch diameter; one 16 inch adjustable Roll grooved; all gear: Power required, 20 to 30 h.p.; Weight 6,500 pounds: Floor space 8 feet by 9 feet 3 inches.

## Thin Saws, Perfect Work

THE Wickes Gang will make good lumber all of the time. There is never any problem about getting perfectly manufactured stock from the gang.

The saws, while thin, are stiff, being keyed tightly in a stiff steel sash that moves in perfect fitting vertical ways allowing no side motion. Gang saws do not waver, snake or run as do band or circular saws.

The legs or cants are fed through the saws between feed rolls that allow no variation from a straight line.

Hence! Smooth, true sawing; every board of exact thickness from edge to edge and end to end.

A Few of the Lines We Manufacture

Make your power transmission an **asset** instead of a **liability**—a money-saver instead of a power-waster. Belt your machinery with

## **GOOD YEAR** Imperial High-Speed, Friction-Surface **BELTS**

"The Belt That Clings"

Built the famous Goodyear way, for high-speed pulleys where great tensile strength is demanded

The Imperial has the cling of rubber and the endurance of many plies of hard-twist, long-fibre **cotton fabric**, rubberized, cured and vulcanized into one solid, enduring piece.

## **Earns Cost—Costs Less**

The Imperial Belt is a power saver. It earns its cost by turning into increased production the power and the time lost by slippery leather belting. And it costs less.

## **Wears Longest Without Stretching**

Most economical because it wears longest.—First, because it doesn't slip. Secondly, because it is made by a process that abolishes **internal friction**. This soon wears the life out of the best leather belting and is caused by internal **grinding** as the belt bends and whizzes around small-high-speed pulleys.

Instead of a few plies of coarse fabric, we build up the Imperial with many plies of fine fabric. After the

**stretch has all been taken out**, rubber is forced through and all threads are separated from each other. Thus they can't rub and chew themselves, and the cause of internal friction is eliminated.

These belts are built to suit the purchaser. Let us quote prices on this most durable and economical high-speed, friction-surface, wear-resisting belting.

**We also make other rubber products—Tires. Hose for all purposes, Sheet Rubber Packing, etc. Throughout, you get the same high quality materials, skillful workmanship and years of experience that have built such famous service into products of the Goodyear Tire & Rubber Co., Akron, Ohio, U. S. A. Write us at once.**

## TERMS OF SUBSCRIPTION:

Canada, United States and Great Britain, \$2.00 per year in advance; other foreign countries embraced in the General Postal Union, \$3.00.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

## Student Rangers to be Abolished

An article recently appeared in the daily press to the effect that the Ontario Government had decided to make radical changes in regard to the appointment of fire rangers. The article stated that henceforth no students were to be appointed, and only experienced bushmen would be employed who would have to keep diaries of their work and send them in periodically to the Department. The article was apparently based on a misunderstanding of the situation. Changes which the government have in mind refer only to their own forest reserve in Algonquin Park. In ordinary timber limits which are being operated under licenses from the Ontario Government the owners of the licenses employ and pay the fire rangers, under the supervision of the government. The chance of students or inexperienced rangers being employed upon them is practically nil. In the government reserves, however, a different situation prevails, and the criticism has frequently been made that appointments as rangers upon government forest reserves, have been made with a view to the political or friendly interest of the employee rather than with a view to the proper protection of the forests from fire. It will be welcome news to the lumbermen of Ontario, if the government decides definitely to employ only experienced bushmen as rangers. The danger of a conflagration upon Crown land spreading to privately operated limits will be reduced and the people of Ontario will feel that their forest resources are actually being reserved instead of saved up as fuel for a forest fire. This is a step for which all those who are conversant with existing conditions have long clamoured. The student rangers have been a laughing stock for years and in the face of great forest fire losses, the old practice has been continued long beyond the time when the public have urged that it be abolished.

It is claimed by many who were on the scene that the great Porcupine fire of last summer originated entirely on Crown lands, and that if an efficient force had been in existence it could have prevented

the great loss of life and property which resulted. By appointing experienced bushmen to patrol the Algonquin forests the government will win the approval of all lumbermen. It is to be hoped, however, that this is only a beginning and that in the near future the government will blanket the whole of the forest bearing Crown lands, with a force of fire fighters sufficient to put an end to the destruction, which in the past has been an annual occurrence.

## Pulp and Paper Tangle Goes to Court

The Federal Government of the United States has denied the formal requests by Germany, Austria-Hungary, Norway and Denmark for free admission of wood pulp, print paper and paper board, made from wood cut on unrestricted lands. These nations demanded the same concession in regard to the wood pulp and print paper as Canada now enjoys under the Canadian Reciprocity Act, which became effective so far as these items are concerned on July 1 last.

In rendering this decision the Treasury Department purposely opens the way for importers who are now paying the duty under protest, to bring a test case before the Board of General Appraisers, in New York, which may be carried to the United States Court of Customs Appeals. Several bills are already pending in Congress to repeal the Canadian Reciprocity Act but a decision by the Customs Court holding that it was not the intention of Congress to have the wood pulp provision of the Reciprocity Act effective unless Canada herself accepted the entire Act, will remove all troublesome features so far as the Government's relations with European nations concerned.

In announcing the decision the Treasury Department gave out this statement: "Careful consideration having been given to the briefs presented on both sides of the question whether or not the provisions of section 2 of the Act of July 26, 1911, granting free entry to Canadian wood pulp, print paper, and paper board made from wood cut on restricted lands should be extended to similar articles produced in countries other than Canada, with which this country has treaties granting the most-favored-nation treatment with respect to the imposition of Customs duties, it has been decided that inasmuch as the questions presented contain many elements of doubt as to the proper interpretation and inter-relation of the treaties and statutes involved, the right of free entry will be denied. This action will provide the only means of having the issues subjected to judicial determination, as the importers who feel aggrieved by the ruling may carry their protests to the Board of United States General Appraisers, and then to the Court of Customs Appeals. The department has issued instructions to the officers to have them co-operate with the importers in bringing the cases forward for speedy hearing and determination.

"It is acknowledged that there is some doubt in the minds of President Taft and his Cabinet advisers as to the exact intention of Congress in making operative section 2 of the Canadian Reciprocity measure, granting free admission to wood pulp and print paper from Canada independently of the rejection of the measure by the Canadian voters. Mr. Taft is not certain that Congress really intended there were similar concessions from Canada in the reciprocity pact. When the reciprocity measure was voted down in the recent Canadian election, section 2 had already become operative, and wood pulp and print paper from Canada were being admitted free of duty. The result was that the admission of Canadian wood pulp and print paper free of duty was in the nature of a gratuitous concession made by the United States without a corresponding concession from Canada.

The United States Court of Customs Appeals, it is expected by officials of the treasury, will render its decision in the tariff controversy over the free entry of wood pulp and paper before the end of March. This calculation is based upon the assumption that the Board of General Appraisers at New York will dispose of the question and open the way for an appeal to the customs court by the end of January. Importers of paper from Belgium and England have

added their appeals for free entry to the eight other countries claiming the privilege. News print paper shipments amounted to 111,248 tons during November, exceeding October's record shipments by 704 tons, as reported to the Commissioner of Corporations by the American Paper and Pulp Association. Production showed

a similar increase, but was considerably less than the shipments, leaving stocks of 38,650 tons. November's actual output per working day was 4,103 tons, being exceeded during the year only by the June output of 4,246 tons daily. November returns covered 50 companies compared with 49 in October.

## The Dangers of Yellow Pine Construction

The use of yellow pine in Ontario has become so general that to-day those who are in charge of the construction details of a building will specify it in many cases without any apparent concern about the fire-resisting qualities of the building. In the early days of the use of yellow pine in Ontario, it was largely confined to long spans and similar purposes in which strong timbers of extra length were required and for which Canadian timbers were considered to be of inferior efficiency. Familiarity with the use of yellow pine has, by degrees, lead those who handle it to overlook its dangerous features. As an interior trim material, its dangers are recognized by many, yet so successfully has it been advertised and so cheaply has it been poured into the markets of Canada, that on account of its attractive finish, the inflammable nature of the wood is forgotten or ignored. The fire in a Toronto residence which occurred about one year ago, blotting out the lives of all but one member of the family, should have been a lesson in this regard, but like other serious catastrophes, its moral was forgotten as soon as the story ceased to occupy the front pages of the daily press.

In the city of Toronto, which was the scene of this terrible fire, one may find to-day, if he inspects the buildings which are in course of erection, that yellow pine is not only a popular wood for interior finish, but is being used for other purposes which should be forbidden by the city architect. A new building by-law is being drafted to-day in Toronto and this subject should be given serious attention. So far is this from being the case, however, that under the Ontario by-law, and, according to present indications, under the new by-law as well, yellow pine is, and will continue to be, specified, not only in private buildings, warehouses, etc., but in buildings erected by the city itself for public purposes. Some years ago, the wood and timbers used in the public schools of Toronto were almost entirely Canadian products. To-day the specifications in many cases call especially for yellow pine. This, from a patriotic point of view should not be the case, whenever it is possible to secure native woods which will fill the purpose equally well. It will be urged by those who are responsible, that although there are Canadian woods which would fill the bill, they are much more expensive than the United States woods, and therefore are out of the question. This, indeed, is the case in some instances, but these instances are few and the consumer of lumber is able on account of the absence of any duty upon rough lumber entering Canada, to secure these classes of lumber and timber and all the other classes which compete directly with Canadian products, at prices that Canadian manufacturers can not duplicate if they wish to make a profit or to pay a living wage. The case for a duty upon a foreign product was never stronger, yet the governments of the country have always deferred to the consumer

and have felt that they were entitled even to destroy the lumbering industry rather than impose a duty and thus incur the displeasure of the Canadian farmer, or the manufacturer for whom lumber is a raw material.

That the use of yellow pine is not confined to those woods which can not be secured in Canada at the same price is evident to any who will investigate. In Toronto to-day one may find instances without difficulty. A building, for example, is being erected on Front street east in which 12-in. x 12-in. yellow pine is being cut into lengths of 8 feet or 10 feet and used as supports for the floors, as well as for beams. For this purpose Canadian woods would have served equally well, yet so general has the use of yellow pine become that it is second nature for the architect to specify it and to feel he is doing his whole duty to his clients. A building such as the one referred to, having its floors supported by yellow pine, constitutes a serious fire risk. Once the flames secure a hold upon the interior of such a building, the yellow pine posts upon which the floors are supported will be destroyed before anything else and the floors will fall, with consequent danger to life. Such death-traps should not be permitted in any city, yet they are being openly constructed to-day with the sanction of the city architect of Toronto.

Yellow pine to-day is not only a drug upon the markets of Canada, but it is frequently a menace both to the safety of the building in which it is used and to the prosperity of the lumber trade. In the United States it has depressed the lumber markets from one end of the country to the other, and so extensive is the yellow pine manufacturing industry that there seems to be little possibility of its ever being regulated in a sane enough manner to prevent the over-production and consequent sacrificing of stocks which have led to the invasion of this wood in the Canadian markets. There is only one way in which this ever can be counteracted, aside from a campaign of education among the consumers of lumber, and that is by the government of the country awakening to the gravity of the situation and placing a duty upon the imports of lumber such as yellow pine. The claim of the consumer of lumber, that he is entitled to secure this important raw material in a market open to the competition of the world, is sound enough, when economic conditions permit the manufacturer of Canadian lumber to compete on equal terms with the manufacturers in other countries. But this is as strong a case as ever was conceived for the imposition of a duty with a view to placing the Canadian manufacturers economically upon the same footing as his foreign competitor.

## Wasted Wealth—Time to Make a Change

Lumbermen in Canada have long been familiar with the great waste of raw material accompanying the sawmilling and woodworking industries of the country. There has seemed to be almost no remedy for this situation until recent years. The increased value of lumber and of its products, however, has lead to a closer utilization of the forest wealth of the country and to-day the time is rapidly approaching when the exigencies of competition and the growing scarcity of forest products will make it economically possible to prevent a great portion of the waste, which has been in progress ever since the birth of the sawmilling industry. In another section of this issue of the Canada Lumberman will be found an article contributed especially by a writer who has made a close study of the

forest products of Canada and of their economic value. The most important fact brought out in the article is that it is possible to save a great deal more of the products of Canadian forests than is at present being done.

This being the case the question resolves itself largely into one of ways and means. Public spirited and economically interested lumbermen have from time to time investigated the problem from their own individual economies. It remains, however, for the government of the country, through its forestry department, to make a close study of all the questions involved and to give to the lumbering and woodworking industries the benefit of their findings. Already the government of Canada have done a great deal in the direction

of gathering statistics of the lumbering industry and have reached, after several years of investigation, a stage at which it is now possible to make use of the statistics compiled, as a basis for systematic study of the uses to which the various forest products of the country may be put.

Considering the wonderful forest resources of Canada the government has been behindhand in taking up these studies, especially when comparison is made with the efforts of other countries. To-day, with a well organized forestry department and public sentiment thoroughly awakened to the importance of preventing wasteful destruction, the opportunity is ripe for falling into line with other progressive countries in this matter. The assistance of the lumbering

and woodworking industries would be given without stint if the government should adopt such a course. Unless they take up the question vigorously, the lumbering industry of Canada is certain to fall far behind those of other more progressive countries. Canada can not afford to allow any such course to be followed. Competition from other lumber producing countries makes it imperative to-day that scientific assistance be given to the industry. When a total waste of 175,000,000 cubic feet can be shown in tops, stumps and logs left in the woods, 47,740,000 cubic feet in slabs and 9,600,000 cubic feet in sawdust, during one year, it is certainly time for everyone who is responsible in the matter to sit up at nights until they have found out how to prevent the waste.

## Wood, Pulp and Paper—Canada Holds All the Cards

Free entry of pulp and paper into the United States is still being vigorously mooted across the line. The Montreal Star in the course of a breezy editorial upon the subject has the following vigorous remarks to make:

"It is reported from Washington that the Democrats propose to cut the Gordian Knot of the free pulp tangle by simply putting wood pulp and print paper from all countries on the 'free list.' That would reach at a bound what the newspapers of the United States supported Reciprocity to get. They would not have to wain until the Canadian Provinces has been 'lobbied' into removing their restrictions on the export of logs—a tedious and possibly interminable process—but would get cheap paper at the drop of the hat.

"It is thought possible that the Republican Senate will permit this bill to pass, in view of the fact that it has already agreed to the bulk of the practical effect of such a measure. Whether President Taft will then give it his signature, only the gods know. But, if he refuses, it seems likely that the next Democratic President will follow the lead of his party. When that comes about those of us who have contended that all that Canada need do, is to 'stand pat,'

to get a monopoly of the papermaking trade on the Continent, will be justified by events. The American market will then be wide open to our paper as well as our pulp; but we will still have our restrictions in force on the export of unmanufactured raw material. We will not have yielded an inch, and we will have got all that Reciprocity promised us along this line.

"This is a game in which Canada holds all the cards; and it was supreme folly to suggest that we should throw them on the table and surrender the stakes. We have a monopoly of the pulp wood of the Continent. We have matchless water powers. There is no reason in the world why paper-making should not be an almost exclusive Canadian industry, enriching our people, giving employment to thousands of young Canadians, establishing towns in the forest to consume Canadian produce and manufacture, and enabling us to coin our forests into gold. Nothing but a courageous policy is needed to secure this result. What we have we'll hold will do it. The Americans are bound to have our pulp wood in some form; and it is merely a question whether they will get it as logs, as pulp or as paper. It will pay us best to let them have it as paper."

## Editorial Short Lengths for Busy Readers

A delegation of Quebec merchants recently asked the Provincial Prime Minister that the official duty for driving logs in the Chaudiere and Etchemin rivers be fixed and made known, to prevent disputes between the lumbermen and the officers of the revenue.

Vancouver shingle manufacturers are petitioning the Federal Government to impose an import duty on shingles from the United States. Shingles are now imported duty free. Canadian shingles have been practically driven out of the United States because of the duty of fifty cents per thousand imposed by Americans.

That smallpox has broken out in several lumber and construction camps throughout the Province of Quebec, is the latest report which has reached the Provincial Board of Health. No definite figures are at hand yet, but Dr. Pelletier, Secretary of the board, states that inspectors will be sent out to investigate the conditions and stop the contagion, if possible.

An increase of \$426,032 in imports over those of 1910 is shown in the figures for the Port of Portland, Maine, for 1911. The total value of imports last year was \$1,687,357. The increase was due chiefly to the large shipments of pulp wood and wood pulp from Canadian and Norwegian ports, imports of these materials for the year being valued at \$959,592.

A Washington, D.C., despatch says:—While foreign nations are clamoring for the free entry of woodpulp and paper into the United States on an equality with Canada, the Treasury Department has decreased the supply which can be imported from Canada without duty through an order relating to the Indian lands of Ontario. In future, woodpulp or paper made from the woods of these lands must

pay duty because of the Canadian regulation prohibiting the exportation of wood cut from Ontario Indian lands for the manufacture of wood pulp. This places the lands in the same class as the Crown lands, upon which exportation restrictions are placed, and is in accordance with the agreement with Canada.

Canada's export trade of wood pulp is increasing annually and during 1910 amounted in value to five million, seven hundred thousand dollars, according to information furnished to the Dominion Forestry Branch by the Department of Trade and Commerce. The three hundred and twenty-nine thousand tons of pulp exported was an increase of forty-eight thousand tons over the amount shipped in 1909. Wood pulp exportations in 1910 amounted to seventy per cent. of the total produced in Canada, whereas in 1909 the proportion was only sixty-three per cent. Eighty-eight per cent. of the export was mechanical pulp, and that remaining twelve per cent. was chemical pulp. During 1910, over three-quarters of the pulp exported went to the United States, while shipments to nearly all other countries decreased. The United Kingdom takes most of the remaining one-quarter, although exports to these countries have fallen off greatly. Particularly is this so with chemical pulp, not one-seventh the amount being shipped in 1910 as in 1909. The average value per ton of the pulp exported in 1909 was \$14.67 for the mechanical and \$36.35 for the chemical pulp. This is a combined average of \$17.31 or 14 cents less per ton than for the previous year. The prices paid to Canadian exporters by the various importing countries were per ton for mechanical pulp: United States, \$16.09, or exactly the same as in 1909, and United Kingdom, \$15.78 or \$5.52 more. For chemical pulp, the amounts paid were: United States, \$36.32 per ton, and United Kingdom, \$41.60 per ton.

# Important Sawmills of the North Shore

**No. 8.—Wolverine Cedar and Lumber Company's Excellent Plant at Little Current, Ont.—Splendid Facilities for Production and Shipment of Good Lumber—Modern Methods of Operation**

**A**MONG the tourists enjoying one of the Georgian Bay boat trips in the summer of 1908 was a lady of observant manner and inquisitive disposition. As the boat left the town of Little Current and steamed westward up the channel, she gazed in wonder at the north shore of the island. Pile after pile, nearly every pile full, made practically a solid wall of white pine lumber to the height of the boat's deck and almost half a mile long on the water front, and two saw mills, one at each end of the island, busily disgorging more white pine, which proceeded along the trams in great truck loads and disappeared behind the wall of lumber. After looking over the scene carefully, the lady spoke to her husband in an undertone, indicating by gestures, first the lumber docks and then a man who had embarked at Little Current and also stared—without enthusiasm—at the great wall of lumber. The husband approached the man. "Pardon me," he said, "but my wife wants to know what is going to be done with all that lumber." "That same question is costing me lots of sleep," replied the man, with a rather grim smile. "My company owns that lumber. We can't sell it and don't seem to be able to give it away, so I guess we'll have to burn it." The lady's curiosity was satisfied. Happily, however, sales were soon effected, boats arrived and the impending disaster was averted. This lady was only one of many persons—not only tourists, but lumber buyers and other men familiar with the lumber industry—whose attention

Mr. R. A. Edwards, President

Mr. R. E. Edwards, Vice-President

Wolverine Cedar and Lumber Company—Logging Scene

has been attracted by the excellent stock of lumber and shipping facilities of the company which operates the Picnic Island plant.

The company is known as the Wolverine Cedar & Lumber Company, with its home office at Sault Ste. Marie, Michigan; logging headquarters at Webbwood, Ontario; and mills at Picnic Island, Little Current—one of the numerous Michigan lumber concerns which have gone to the Georgian Bay country for pine as their Michigan holdings neared depletion.

This company made its initial investment in Ontario pine in 1905, when it bought the township of Dunlop on the Spanish River, and has since then increased its holdings by the purchase of an adjoining township, within the last few months. It operates five camps, employing between 400 and 500 men, and produces annually between twenty and twenty-five million feet of white pine, norway and spruce lumber, principally white pine. It has adopted several methods for cheapening its logging and has in successful operation in its camps a number of labor saving devices, among them a steam pump for filling and thawing out its sprinkler tanks, a gasoline log loader, and also a steam log hauler, an account of which appeared in our September 1st issue. The logs are driven down the Spanish River to its mouth, sorted and rafted there and towed to the company's Little Current mills in rafts of about 50,000 pieces each.

The company's saw mill plant at Little Current is one of the

Wolverine Cedar and Lumber Co., Little Current, Ont.—View of Mill.

Wolverine Cedar and Lumber Co., Little Current, Ont.—View of Mill.

Wolverine Cedar and Lumber Company—The Filing Room

most satisfactory on the north shore, for the sawing, drying and shipping of lumber. The log pond, entirely protected in any wind, and an adjoining bay which is used for storage, together hold in safety about 200,000 logs, and a sorting jack of four pockets between the main log pond and the jack ladder of the mill enables the company to separate white pine, norway and spruce logs before sawing, and also to make two sortings of its white pine logs. This facility enables it to get the greatest value out of its logs and is greatly appreciated by the company's customers.

The mill itself, now in a high state of efficiency as regards both daily output and quality of manufacture, is an interesting example of what can be done with a mill which had fallen into a bad state of repair, and also of the constant attention necessary to keep such a mill up. When it was taken over by the Wolverine Company in 1906 it had not been operated for several seasons, contained some machinery which had been superseded in most modern mills, and a good part of its essential timbering was in bad repair. It was hurriedly overhauled and some new machinery installed before the first season's sawing, and then as that season showed up many of its weak spots, was repaired part by part the following winter and spring, and has been every season since. One very satisfactory feature about it from the outset, however, was that the engine, gang, and band mill foundations were very firm, being built independently of the mill, direct on the rock which makes the island, and the resulting absence of vibration no doubt accounts in large part for the excellent quality of the manufacture. The mill itself is a two-storey frame building about 56 ft. by 150 ft., with a filing room above the saw floor and an iron roof. The machinery consists of a double cutting Waterous band mill on the right hand side, a circular saw on the left hand side to make cants for the gang, a 32-in. Wickes gang, two edgers, two slashers, and a lath mill, in addition to the usual equipment of steam kickers, loaders, niggers, live rolls, conveyors, etc.

Wolverine Cedar and Lumber Company—The Double Band and Carriage

The boiler house is of stone with an iron roof, about 40 ft. by 50 ft. in size, and contains five 60-in. by 16-ft. horizontal boilers. The engines are two in number—one Wickes 24-in. x 32-in. which drives the circular, band and gang saws, the log jacker and part of the live rolls; and one Bay City, 20-in. x 20-in., which drives the edgers, trimmers, slashers, lath mill, conveyors and sorting chain. The mill has an average capacity of about 130 M. feet of well manufactured lumber and 40,000 lath per day of ten hours, although on thick lumber it has averaged as high as 165 M. feet per day of ten hours, for a month at a time.

One of the best features about the plant is the splendid facility it has for drying lumber. Picnic Island is practically a ledge of solid rock which dries quickly after a rain and does not hold moisture to stain the lumber. The island lies out in the channel in which there is always a wind blowing either up or down, so that the lumber is dried quickly and with very little stain. As an additional precaution the company sprinkles with a solution of bi-carbonate of soda all items that are susceptible to stain.

Everything possible has been done to minimize the fire risk. Through a large part of the yard and around the mill, a waterworks system is maintained, supplied from an elevated tank outside the yard limits. The tank is always kept full and is supplemented by a fire pump in the machine shop where its operation is independent of the mill. In addition, the water barrels scattered along the trams and through the yard are always kept filled. A four hundred foot clear space is maintained between the platform of the mill and the beginning of the lumber piles, and as the piling ground is kept picked up clean, the fire risk is very small, and a low insurance rate is enjoyed. As an example of the excellence of the fire protection, the former timber mill situated at the west end of the island, and operated by the company until it burned, was entirely destroyed by fire last summer, and though a gale of wind was blowing directly from it toward the lumber not a foot of lumber was burned.

The length of the water dock inside the fire limits is about 1,800 feet, the docks accommodating a maximum of about nine million feet and the yard about seven million. The docks are built of crib work directly upon the rock ledge of the island and weighted with stone. The rock formation makes it impossible to drive any piles. The ledge drops away rapidly under the docks so that there is plenty of water, and any lumber boats on the Great Lakes are able to take on full loads without lighterage.

In addition to the mill office and boarding houses there are about fifty dwelling houses on the island. Of these twenty-five are reserved for the office, mill and yard employees of the company, and the other twenty-five for the Indians who serve as vessel loaders. The company employs about ninety men in the mill proper, another fifty sorting logs, tramming and piling lumber, etc., and a maximum of about one hundred more when loading vessels. The average annual cut is from twenty to twenty-five million feet, although the company has cut as high as twenty-eight million feet in a season on day run.

The officers of the company are R. A. Edwards, president; R. E. Edwards, vice-president and general manager, and P. A. Shepard, secretary and treasurer. G. E. Hornibrook is local manager in charge of the sawmill operations, and W. J. Davis is mill foreman. R. J. Bartley is superintendent of the company's logging operations.

### Bitter Dispute Over Fort Frances Water Power

E. W. Backus, of the Ontario and Minnesota Power Company, International Falls, Minn., U. S. A., has issued a writ at Osgoode Hall, Toronto, against the Rat Portage Lumber Company, the Rainy River Lumber Company, the Shevlin-Clarke Company, the Northern Construction Company, and Lockhart & Company, for an injunction restraining the defendants from interfering with the natural flow of the Rainy River past the lands and works of the plaintiff.

Mr. Justice Middleton, before whom the application was made for a temporary injunction, held that an interim injunction would occasion greater injury to the defendants than the continuation of the evil to the trial would occasion the plaintiff, refused the application, and His Lordship says, in his written judgment that the plaintiff's rights are by no means clear, and that there is no doubt that the defendants have used the waters in the manner indicated for years. The plaintiffs are given leave to amend, as asked, by adding new defendants, and His Lordship suggested that a speedy trial be arranged.

A great deal of warm feeling has been developed at Fort Frances, Ont., over the situation. The Fort Frances Times, referring to the situation, says:

"Finding the water in the lake getting low, Mr. Backus wants all the stop logs removed from the temporary dams on streams running into Rainy Lake, thus lowering the lakes and streams where timber is piled awaiting the ice going out before being driven down to the lake. If the demand by Mr. Backus were acceded to, every lumberman and timber contractor having timber to drive on the upper streams and lakes, would have their logs stranded and tied up

and their mills idle next summer for want of logs to keep them running. It is little short of an outrage that our lumbermen should be handicapped and the timber industry of this district paralyzed in order that the water (Canadian water, mark you) should be obtained to run through an American house to grind Canadian pulpwood into pulp for manufacture on the American side with American labor.

"Our people have it rubbed in pretty well as it is, but how much longer our government will permit such a division to be allowed is something the people in this district would like to know. Things have come to a pretty state of affairs when an American corporation can come over here and take anything they like without as much as even thank you. The lumbermen should all unite in a protest to the minister of lands, forests and mines, backed up by the people that hands off is the watchword. The people are in no mood to be tricked out of everything by the American Power company.

### Lumbermen and Foresters in Convention

The annual meeting of the Canadian Lumbermen's Association which is to be held in Ottawa on Feb. 6th promises to be more interesting and more largely attended than any which the Association has formerly held. A feature of much additional interest is the fact that on Jan. 7th and 8th the 13th annual meeting and convention of the Canadian Forestry Association will also be held in Ottawa. It is expected that a large number of the lumbermen will remain and take an active part in the meetings of the Forestry Association. The forestry meeting will be held in the railway committee room of the Parliament Buildings and the proceedings will include the reading and discussion of a number of very interesting papers.

On Feb. 7th a joint banquet will be held by the Canadian Lumbermen's Association and the Canadian Forestry Association. Arrangements have been made with the railways for securing return tickets from any point in Canada east of Port Arthur at a single fare rate, the tickets to be good going Feb. 3rd to 8th inclusive, and returning until Monday, Feb. 12th.

Among the important matters to be discussed at the annual meeting of the Canadian Lumbermen's Association at Ottawa on February 6 are the following:

The Proposed Duty on Lumber Imported into Canada:—As very strong deputations are coming from British Columbia, it is important that all sections of the country should be fully represented.

Steps Necessary to be Taken to Prevent "Dumping" of Lumber into Canada in View of the Cancellation of the "Dumping" Clause by the Government.

The Extension of the Association's Trade Report Branch.

Proposed Reduction of the Annual Fee:—Moved by Walter C. Laidlaw, Toronto; seconded by Dwight J. Turner, Toronto; That the annual fee of \$50 be reduced to \$25, if a corresponding increase in membership would result, thereby largely increasing the usefulness and value of the association.

### British Columbia's Forestry Plans

Hon. W. R. Ross, minister of lands for the Province of British Columbia, returned recently from a visit to Ottawa and to the National Irrigation Congress of the United States, at Chicago. In the course of an interview Hon. Mr. Ross said:—"During my visit I had an excellent opportunity to get in touch with many of those who are considered experts on irrigation on this continent. In conversation with Gifford Pinchot I talked on the organization of the forestry bureau, which it is proposed to establish in British Columbia. He expressed his warm sympathy with our efforts and said that the bureau would prove of inestimable benefit. He said that in dealing with such questions, Canada enjoyed a very great advantage over the United States, as we were not burdened with constitutional law. In this country also we are lucky in that the process of deliberate waste has not proceeded nearly as far as it has in the States when the work of the bureau was commenced there about 10 years ago.

"In connection with the decision of the government to establish a forestry bureau, that also will be put through the necessary legislative and other stages as rapidly as circumstances will permit. But you can easily understand that it is a question in which it is not wise to proceed too fast. It will be necessary to obtain the best expert advice available, and this we will proceed to do. This will take time but it would be obviously unwise to proceed in any other way. Meanwhile the work of forest protection from fire will be carried forward as satisfactorily and as thoroughly as it can possibly be under existent circumstances. Having obtained expert advice I expect that we shall be in a position to secure whatever legislation may be necessary during the session of 1912, for the establishment of our forestry department. Even then, however, some time must elapse before it can be got into running shape, and for that

reason it will be a good while yet before we will be in a position to make appointments in this new branch. In choosing the personnel of the new department we intend to get men who have technical as well as practical qualifications.

"While I was in Ottawa I spent some time going into the systems followed by the federal government both as regards irrigation and forestry, and I have no doubt that we shall be able to benefit greatly by the experience which the officials of the Dominion Government have already gained in these matters."

### Mountain Industry Marking Time

The mountain millmen of British Columbia are not making preparations for a big cut this year. Mr. Geo. D. McKay, provincial timber inspector, who has returned from a tour of the interior, points out that the mills had to close down sixty days earlier than they had intended because American millmen in Idaho and Washington unloaded their surplus low grades into the Canadian northwest at less than cost price. They rushed in three hundred million feet. The millmen, however, remain very hopeful and take encouragement from the fact that, although the immediate demand has been filled, the yards of the dealers in the northwest contain less than usual at this season of the year.

Mr. McKay reported that some camps in the interior were closing down and very few companies were putting in supplies for next month. "I found that there was no financial depression anywhere," he said, "but there certainly is a fall-off in the trade owing to the large amount of timber shipped into the prairie provinces from the United States. There is considerable activity in the Arrow and Kootenay lake district where work is in progress by contractors for the Manitoba and Alberta provincial governments, cutting down cedar poles for their telephone systems. The Canadian Pacific Railway is also active cutting a large order of railway ties."

Although the very sanguine expectations of an immense gain in the cut for the province have not been realized, it will be a banner year from the revenue producing standpoint, the royalties being more than \$30,000 more than ever before.

### Australian Imports of Canadian Timber

Australian trade returns of the importations of timber from Canada are only approximately correct, says the Dominion Government Trade and Commerce reports. Shipments of British Columbia timber are frequently made by San Francisco brokers and invoiced by them on their own invoice forms. Thus the United States is credited, as the country of origin, with some of the cargoes of Douglas fir from mills in British Columbia. In making a comparison between the trade returns of each country, it will be noted that the Australian figures are for the calendar year, and the Canadian for the fiscal year ending on March 31. The values in the Commonwealth returns are shown as follows:—

Imports of timber from Canada in 1908..... £36,725

Imports of timber from Canada in 1909..... 84,849

Imports of timber from Canada in 1910..... 77,150

The values in the Canadian returns, converted at \$4.86 to the £, are shown thus:—

Exports of timber to Australia in 1908..... £107,166

Exports of timber to Australia in 1909..... 72,950

Exports of timber to Australia in 1910..... 101,333

Making allowance for the periods at which the two returns were compiled, it will be observed that the total Canadian exports for the three years 1908-10 exceeded in value that shown in the Australian trade figures by £82,725.

Melbourne and Adelaide import probably all the spruce shipped to Australia. There is no separate classification of this timber, but for the year ended on June 30, 1911, it is estimated that the imports into Melbourne were 5,555,000 feet and into Adelaide less than 2,000,000 feet. White pine from New Zealand and pine—imported in logs—from Siberia and Japan form the principal competition to spruce in the Australian markets.

A Vancouver, B.C., report states that Vancouver shingle manufacturers are petitioning the Federal government to impose an import duty on shingles from the U. S. Shingles are now imported duty free and forty million came in last year. Canadian shingles have been practically driven out of the United States because of the duty of fifty cents per thousand imposed by Americans.

John Yuille, Ontario lumber inspector, whose home was in Arnprior, died very suddenly at a lumber camp eight miles from Jocko station, Ont., on the T. & N. O. railway. Upon leaving the train at Jocko he complained of not feeling well, but insisted on walking to the camp. He became worse on the trail and did not reach the camp for seven hours, death coming shortly after.

## Signal Honor for Sarnia Lumberman

John McGibbon Elected Mayor by Largest Majority Ever Given in Sarnia Important Problems to be Handled

John McGibbon, Sarnia's New Mayor

Lumbermen in Canada are noted, among other things, for the enthusiastic interest which they take in the public affairs of the country. In Parliament, and in municipal councils they have long been an important factor in the direction of public business. An interesting instance is the case, Mr. John McGibbon, of Sarnia, Ont., one of the best known and most highly respected lumbermen in Western Ontario. At the municipal elections in the town of Sarnia, which were held on Jan. 1st, Mr. John McGibbon, whose portrait we are pleased to publish herewith, was elected to the important position of Mayor. The high respect in which he is held by the citizens of Sarnia is fairly illustrated by the fact that he received 1,250 votes while his op-

ponent received only 564. Mr. McGibbon's majority was therefore greater even than the total number of votes cast for his opponent. It was in fact the largest majority ever given to any Mayor, in the town of Sarnia.

Mayor McGibbon comes into the direction of the affairs of the town of Sarnia at a time when the important issues to be dealt with are more numerous than they have ever been before. For instance he will have to deal at once with the problem of taking over the Gas and Electric Light Company, of Sarnia, a step which both he and his opponent in the election supported strongly. This particular move was one of Mr. McGibbon's principal hobbies. We understand that arbitrators are now deciding upon the price to be paid by the city for this property. When the sale has been completed, Mayor McGibbon and his council will have to devote their attention to the management of the undertaking. Other important problems are pressing for solution, such as the movement of the intake pipe for the waterworks. That the town of Sarnia under the progressive management of its public spirited citizens is making rapid progress is also indicated by the fact that a large American company, Messrs. Mueller Bros., of Decatur, Ill., manufacturers of brass goods, plumbers' supplies, etc., have decided to locate a factory there. It is thus apparent that Mayor McGibbon will have his work cut out for him during 1912. His well-known business ability however, is certain to be devoted successfully to the solution of the numerous problems which will turn up. As a representative public citizen, the lumber industry and trade of Ontario have every reason to feel proud of Sarnia's new Mayor.

### Lumber Trade Calendars for 1912

Frank A. Cutting, 79 Summer street, Boston, Mass., buyer and seller of hemlock bark, has again favored his friends with an excellent calendar with large date figures and bearing an illustration of a car load of hemlock bark. The car represented is one of the well-known Cutting patent bark cars.

The Parry Sound Lumber Company, Parry Sound, Ont., have selected for their calendar this year, a companion picture to that which they chose last year. The new picture represents a couple of cruisers making a portage, the painting being by Philip R. Goodwin. The color reproduction of the painting is very truthful and the picture itself is one which will have an especial appeal for all lumbermen who have ever known anything of life in the woods.

Duhlmeier Brothers, manufacturers of hardwood lumber, Cincinnati, Ohio, always make a happy selection for their annual calendar. This year they have sent to their friends a calendar designed in light blue and white, containing in addition to the date pad, a dainty colored picture of a young lady carrying a bouquet of violets. The calendar is one which is sure to be welcomed gladly by all who are numbered among the friends of Messrs. Duhlmeier Brothers.

The Colonial Lumber Company, Pembroke, Ont., have selected one of the most handsome calendars that have appeared for the year

1912. A beautiful reproduction of a painting by J. D. Gerome Ferris, entitled "The Golden Wedding" constitutes the greater part of the calendar, and the calendar pad itself is designed and mounted in excellent keeping with the illustration. The calendar is one which will attract universal admiration and will be gladly welcomed by all who are fortunate enough to receive a copy.

The Digby Lumber Company, Lindsay, Ont., have sent out to their friends a most attractive calendar for the year 1912. In addition to a large calendar pad mounted on a handsome dull green paper, the calendar is accompanied by a reproduction in colors of an excellent painting by W. Verplanck Birney, A.N.A. The picture represents the interior of a beautiful English house of a century ago. Seated near an open fireplace is the family solicitor vainly trying to explain to a young lady the intricacies of a badly tangled estate which has been left to her by her father. The calendar will be a welcome souvenir in the offices of all who are fortunate enough to receive a copy.

"Looking into the future" is the title of one of the most attractive calendar illustrations which have come to our notice during the present New Year. The calendar has been sent out by Messrs. Edward Clark & Sons, Stair Building, Toronto, the well-known dealers in all kinds of hardwoods. The general make-up of the calendar is excellent, the harmonious color scheme, both of the illustration and the mount, as well as of the calendar pad itself being very attractive. The colored illustration is a reproduction of a painting by Wm. Thorne, A.N.A. We feel certain that everyone who is fortunate enough to receive a copy of this beautiful calendar will consider themselves especially indebted to Messrs. Edward Clark & Sons.

The Fred S. Morse Lumber Company, Springfield, Mass., U. S.A., have sent out for 1912 a unique and attractive calendar. A separate sheet is devoted to each month of the year and each sheet contains at the head in neat border design, a few sentences, printed in bold and artistic type, containing words of wisdom regarding the characteristics and business habits of mankind. These little sentences or maxims as they might more properly be called are all brief, bright and to the point. On the cover page of the calendar the company conveys its 1912 greetings to its friends and presents them with a business decalogue which will be read with much interest and approved by all who do business on the only invariably successful plan—square dealing and generous consideration of the interests of others, of which the Fred S. Morse Company themselves are noted exponents.

### Personal and Trade News of Interest to Lumbermen

E. W. Beckett has been appointed Crown Timber Agent at New Westminster, B.C.

A Barret & Company, Brule Lake, Ont., have completed their operations at Brule Lake Station and will not be cutting there in 1912.

Mr. George Cahoon, Jr., manager of the Laurentide Company, and Mr. J. H. A. Acer, of the same company, recently paid a visit to Montreal.

Joseph Oliver, of the Oliver Lumber Company, Toronto, has been elected to the Conference Committee of the Toronto Board of Trade, to represent the dealers in builders' supplies and lumber.

Mr. J. L. Campbell, of Campbell & Johnson, Toronto, will be one of the speakers at the annual convention of the Western Retail Lumbermen's Association which is to be held at Winnipeg on Feb. 13th, 14th and 15th.

D. G. Gilmour, of Ottawa, who has been in the wholesale lumber business for some years, has associated himself with Mr. J. A. Belford, who for the past fifteen years has been with W. C. Edwards & Company. The new firm will be known as D. G. Gilmour & Company, with offices at 126 Sparks street, Ottawa, Ont.

In the last issue of the Canada Lumberman it was stated that Mr. Arthur Rushforth, 62 Dale street, Montreal, had been appointed British representative of the Dominion Mahogany & Veneer Company, who are building a factory in Montreal. Mr. Rushforth's address should have been given as 62 Dale street, Liverpool, England.

Gordon, Grant & Co., Port-of-Spain, Trinidad, report under date of December 11th as follows:—The Schr. Mayola from Liverpool, N.S., arrived with a cargo of white pine boards to us which we sold promptly on arrival at full rates. An outlet for a small cargo of N. S. lumber containing a good proportion of shipping boards and about 20/30 M feet spruce boards can generally be found at advantageous rates.

# Extravagant Lumbering—Time to Halt

Significant Statistics of Great Annual Destruction of Natural Resources—Duty of Government to Study All Possible Economies

As every lumberman knows there is a tremendous waste in the manufacture of forest products. That this waste exists is not altogether the fault of the lumberman. When it is considered that he only manufacture what will pay a profit and turn it out in the form required by the people, it is doubtful if he can be blamed for very much of the waste.

The blame for the waste in the handling of the forest products lies with the governments and scientific institutions, who alone are able to gather the scientific staff and supply the money necessary to study the methods of use of wood products evolved in other countries, and to study in Canada the question of mechanical and chemical means of utilizing at a profit the great quantities of wood wasted yearly. It is strange that this question has not hitherto received public attention. Only a portion of the attention which has been devoted to improved methods of metallurgy, or to agriculture would have accomplished a great saving. That the lumber industry deserves it, is shown by the fact that the forest products of Canada are more valuable than any of the field crops, nearly twice as valuable as the total mineral products and over five times as valuable as the total of inland and ocean fisheries. That there is great room for improvement in the utilization of forest products is shown by the fact that about 20 per cent. of the entire tree is left in the forest to become a total waste, that 22 per cent. of the log goes into slabs and edgings, 14 per cent. into sawdust, and 13 per cent. into bark; all of which products are practically wasted, although they contain valuable constituents which are capable of being used at a profit.

What this waste means to Canada yearly is shown in the table given below.

Species	Lumber produced in 1909	Slabs, trimmings and edgings	Absolute waste in slabs, trimmings and edgings	Sawdust	Absolute waste in sawdust	Tops, stumps and logs
	Board Feet	Cubic Feet	Cubic Ft.	Cubic Ft.	Cubic Ft.	Cubic Ft.
Total	4,900,000,000	154,000,000	47,740,000	96,000,000	9,600,000	175,000,000
Spruce	1,300,000,000	40,920,000	12,700,000	24,000,000	2,400,000	42,500,000
White pine	1,000,000,000	31,460,000	9,800,000	19,000,000	1,900,000	35,700,000
Douglas fir	450,000,000	14,080,000	4,400,000	8,000,000	800,000	41,600,000
Hemlock	300,000,000	9,460,000	2,900,000	6,000,000	600,000	1,100,000
Cedar	160,000,000	5,060,000	1,600,000	3,000,000	300,000	600,000
Red pine	150,000,000	4,620,000	1,400,000	3,000,000	300,000	500,000
Balsam	90,000,000	2,860,000	900,000	2,000,000	200,000	300,000
Tamarack	65,000,000	1,980,000	600,000	1,000,000	100,000	250,000
Birch	60,000,000	1,980,000	600,000	1,000,000	100,000	250,000
Maple	55,000,000	1,760,000	500,000	1,000,000	100,000	200,000
Basswood	50,000,000	1,540,000	500,000	1,000,000	100,000	150,000
Elm	45,000,000	1,320,000	400,000	1,000,000	100,000	150,000
Others	1,175,000,000	36,960,000	11,500,000	22,000,000	2,200,000	4,200,000

In the table given above there are shown both the total quantities of slabs, trimmings, etc., and sawdust produced, and the quantities wasted. It has been found from investigations that of all sawmill slabs and trimmings produced and unused for lath, twenty-five per cent. are used for fuel; forty-four per cent. are sold for fuel, and thirty-one per cent. are burned in the incinerators or otherwise destroyed. In the same way it has been learned that about ninety per cent. of the sawdust is burned at the mills for fuel and ten per cent. is wasted. No bark is used in any way. It is practically all a total waste. The material left in the woods, shown in the last column, is practically all a total waste.

## Possible Uses

All woods containing turpentine in sufficient quantities can be utilized for the production of this material by the process of steam distillation. The two Canadian woods that could be utilized for this purpose are Douglas fir and western yellow pine. A plant was started for the distillation of the waste of these species on the coast two years ago but was unsuccessful. The process consists in chipping the woods into small pieces, treating it in a closed steel retort with steam under pressure and condensing the escaping vapours which consist of steam and the volatile oil from the wood. By this process the wood fibre is not at all injured and the steam chips can be used for fuel as well as before treatment. For this reason not only the absolute waste as shown above can be used, but also the slabs, edgings and sawdust which are used as fuel. This would amount in the case of Douglas fir to about 15,000,000 cubic feet or 165,000 cords annually. The average yield of turpentine from this material would be about 1/3 gal. per cord or about 55,000 gals. per year from the sawmill waste of Douglas fir. In addition to the sawmill waste the tops, large stumps and wood waste can also be worked up in the same manner. There are about 116,000,000 cubic feet or about 1,300,000 cords of such material wasted annually in British Columbia. This would produce 1/3 gal. of turpentine per cord or 130,000

gals. per year, thus giving 185,000 gals. of turpentine per year from the waste of Douglas fir.

Beech, birch and maple are cut each year to the extent of about 60,000 cords for the production of wood alcohol, acetate of lime and charcoal by destructive distillation. Although sawmill slabs are perfectly satisfactory for distillation and are used for that purpose in the United States, practically none are used in Canada. The hardwoods, birch, maple, basswood and elm are used for this purpose. About 6,600,000 cubic feet or 73,000 cords of slabs of these species are produced in Canada yearly. These slabs, if distilled, would produce nearly half a million dollars' worth of by-products.

## Converting Waste into Pulp

Hemlock, spruce and poplar are at present being used in large quantities for the manufacture of pulp. Douglas fir and the various species of pine are used to a smaller extent but have proven satisfactory for various grades of paper. Experiments which have been carried on during the past two or three years have shown that almost any wood can be made into commercial pulp. The use of waste material for pulp making requires considerable study as sawmill waste contains more knots, bark, rotten wood and dirt than the class of wood generally used by the pulp mills. The removal of these impurities renders the cooking process expensive. It may be mentioned here that the only way to manufacture sawmill waste into pulp is by some chemical process. About four pulp mills closely connected with sawmills are now using slabs for the manufacture of pulp in Canada. About 260,000 cords of sawmill waste were used for the manufacture of pulp in 1910. Sawmill waste for this purpose is valued as high as six or seven dollars per cord. The utilization of sawdust by this process has been little investigated up to the present time, but according to some authorities has possibilities. No final solution can at present be offered and sawdust will therefore be left out of account in considering wastes.

If the slabs and trimmings from the spruce and hemlock lumber manufactured in Canada in 1910 had been used for paper making there would have been available 592,000 cords or almost as much as was actually used for pulp making in this country in that year. The distillation of Douglas fir waste as mentioned above does not prevent the use of the same material afterwards for paper making since the wood fibre is not injured by steam distillation. The only species which need be left out of the grand total which could be used for pulp are therefore birch, maple, basswood and elm, which have been considered as already utilized by destructive distillation. The total available waste in slabs, trimmings, tops and slash left in the woods is about 3,500,000 cords per year or six times as much wood as is at present used by the pulp industry. The utilization of this wood would bring almost as much wealth into the country as is now represented by the whole lumber industry.

Bark is not as closely utilized as it might be. There is about \$430,000 worth of hemlock bark wasted yearly in Canada. Practically all the bark of the western hemlock is also wasted, although it contains twice as much tannin as the eastern hemlock. Other barks which contain tannin, but which are not used at present, are beech, birch, poplar and spruce.

There are several other possible uses which might be developed to produce wealth from wood products at present wasted. Oxalic acid may be made by treating sawdust with fused caustic alkali. No oxalic acid is manufactured in Canada at present.

Ethyl or grain alcohol may be made by treating sawdust with dilute sulphuric acid and fermenting the sugar so formed. This process is now used in France and it is claimed that it can be successfully used in Canada. From 15 to 30 gallons of alcohol can be produced from a ton of sawdust.

Sawdust has three marked mechanical or physical properties which give it commercial value. It is elastic, absorptive and non-conducting. For these reasons it is valuable as a packing material, as an absorbent in the manufacture of dynamite and for polishing and cleansing purposes in the metallic industries.

The utilization of sawdust as a wood substitute has been carried out to a considerable extent in England and France. It is used especially where the elasticity and strength of natural wood are not necessary. In moldings, carvings and paneling the methods all consist of mixing the sawdust with a binding material which hardens on drying or on heating and then moulding the mixture under pressure and heat. Water glass, glue, resin, plaster of paris, blood and casein are the binders used. A flooring material made of sawdust

and Portland cement is used in Germany in place of plank flooring. It is lighter and more plastic than cement and does not crack. This material has been used with excellent results on the decks of trans-Atlantic vessels. At least one factory is manufacturing this flooring in Canada.

The utilization of all the forest products at present wasted is so important to the community at large as well as to the lumbermen that the government should at once undertake a detailed study of

all the sources of waste in forest products with a view to learning by investigation in other countries and by experiment, the different means by which the waste products could be profitably utilized. The necessary experiments and investigations are too varied and expensive to be carried on by any one concern or association. The work can be handled only by the government and can best be handled by that branch of it which is at present charged with forest administration.

# Cost of Saving Mill Waste Products

## Analysis of Methods Employed in a Large Mill—Expenses Involved and Markets Available the Most Important Features

A well informed lumber salesman was discussing the other day some of the factors of lumber manufacture which contribute to the amount of waste sent to the refuse burner, and mentioned prominently the desire to secure a large output and low manufacturing cost. In this remark the assumption was that any effort at saving smaller pieces of lumber must necessarily reduce materially the daily output of the mill, and must also raise the average manufacturing cost per thousand feet.

It seems desirable therefore to review the details involved and see just what might be involved in an effort to get more product from the log, as affecting the operating cost. The American Lumberman some time ago described the operations of a large mill whose special savings of short lumber amount to about 4 per cent. of its output, meaning that it gets 1,000 feet of product out of logs that in the average mill of the better class would turn out 960 feet.

About half of this saving of short lumber is in the drying process, in recutting dry kiln degrades, particularly "twisters," into shorter pieces from which the warp can be dressed, producing straight short uppers. The other half of the savings is at the sawmill, in thinner slabbing of logs in the recovery of pieces which in the ordinary process go to the burner in a practically manufactured state, requiring only an edging or trimming operation to complete the finished board. There is no information at hand as to the proportion between these two sources of saving, but for the purpose of the article it will be assumed that half the saving—1 per cent. of the entire lumber product—is gained by thinner slabbing, involving an extra operation of the main sawing machinery, and a similar amount of edging and trimming.

### Where the Time is Used

In the sawing of a log into lumber a certain portion of the time is used in placing the log on the carriage and in turning it. Thinner slabbing does not add to this time, as it does not involve any extra manipulations of the log on the carriage. The only extra time involved is in the extra cuts. Of the cutting time a portion is used in actual travel of the saw through the log and in the reverse travel through the same distance; and a portion is occupied in reversing direction at the beginning and end of the cut. The first slab is a waney slab, and thinner slabbing would save short pieces of lumber. The obverse slab (on a straight log) is a straight slab and thinner slabbing produces long narrow boards. In the first instance a short travel of the carriage is concerned, the actual cutting and return being accomplished at approximately the same lineal speed, but the reversing time being the same as on the longer cut. Obviously, therefore, thinner slabbing results in producing lumber at a lower production rate, with reference to both the waney and long slabs. Just what the resultant added sawing cost would be could be determined quite closely by time studies with a stop watch. The product obtained by thinner slabbing is of course high grade, since it comes from the outside of the log, and consists of pieces either short or narrow, or both. The narrow strips saved from the longer slabs immediately go into regular product, there being ample use for them in regular planing mill product; and the saving they represent was not figured into the 4 per cent. which the sawmill in question saved, this being entirely short lumber.

### Value Must Repay Sawing Cost

It is obvious, therefore, that lumber from thinner slabbing must be of sufficient value to bear its proportion of the actual sawing cost, which is not merely the average sawing cost of all product but the greater cost per thousand feet which is directly applied to it. In other words, the lumber product of the day saved from the short slabs must be charged with such a part of the day's mill operating expense that the average cost of the other product will remain at the same figure that would have been produced had the thinner slabbing practice not been followed.

It should be equally clear, but in many cases is not taken into consideration, that the entire cost of stumpage and logging is borne by that product which is saved, and that the recovery of additional product by thin slabbing should not be charged with any portion of this antecedent burden. Both here and at all other points in the process the law which applies is that it is unprofitable to waste a piece of material which is of sufficient value to cover the direct costs actually involved in its recovery.

Thinner slabbing also has an effect upon the subsequent auxiliary operations. Lumber produced on the carriage from the squared log is already edged, though certain boards must go through the edger for ripping. The edging operation is confined to boards produced in squaring the log, and thinner slabbing increases the proportion of such boards and consequently the work required at the edger in a proportion much greater than the increase of product obtained from the given log. On the other hand the lessened output of the band saw involved in thin slabbing gives extra time to the edger for performing the work, so these two factors largely compensate. A modern mill is or should be designed with ample capacity back of the saws, so that its output is limited only by the capacity of the main sawing machinery installed.

### Other Material Available

An inspection of the refuse conveyor at almost any mill will show that while much of the material consists of slabs a very material volume is composed of pieces which have already been sawed to thickness and need only edging or trimming for recovery of small pieces of good lumber, often absolutely clear lumber. The extra work involved at the edger or trimmer in most cases, as suggested by the preceding paragraph, may be absorbed by the reverse capacity of machines and men, and this product recovered as an additional product without in any way slowing the productive capacity of the plant on the regular product. In as far as this is done, therefore, such short lumber should bear only its costs of handling from the tail to the mill. It is relieved not only from burden of stumpage, cutting and railroad cost, but from burden of milling.

The lumber coming from the dry kiln in a warped condition, or with other kiln defects injuring only a portion of the piece, under ordinary routine may be thrown away or thrown into the lower grade involving a material sacrifice of value. With respect only to the first class of degrades, those which would otherwise have been wasted, it is clear that their recovery involves only the cost of cutting up into usable shorts, selling and shipping them. Such recovered product is relieved from participation in dry kiln costs as well as in the antecedent costs, since had it not been saved the kiln costs would have been spread only upon the volume of usable product taken from the kilns.

### Handling Cost Greater

The costs from the tail of the mill on short product as compared with the regular lengths are obviously somewhat greater as far as handling of product is concerned. The mill previously mentioned keeps this a minimum by labor specialization. The short common is taken from the chain and piled in the special short lumber alley by men who work on it exclusively, and are trained to quick, light motions. In handling in and out of kiln and handling to the planer, and through the shipping operation, this increased handling cost accrues; but it is found possible to keep a fast feed planer filled to capacity in working 4 or 6-foot boards, or strips, or very nearly so. It costs more to sell the short product, or any product for which a market must be developed, as compared with staple items of demand. It is natural, however, in the development of an outlet for such lumber, to specialize on special dimension patterns, involving special working, but resulting perhaps in a selling value of \$20 or better as compared with \$16 or less for the same stock in stock millwork patterns. Such an increase in value where

it can be produced takes care not only of extra planing mill cost involved but to any added cost of selling.

This discussion of course has dealt only with broad general principles to be followed in keeping the costs on this class of product. What the actual figures might be could be determined only by careful time study and analysis as applied to actual efforts toward saving of waste.

**Table of Approximate Costs**

For the purpose of illustrating how these principles would work out the following table has been prepared, assuming approximate operation costs for the regular stock as shown in first column, and a certain increase of costs for the three classes of recovered wastes already referred to:

	96 percent Regular Product	1 percent Thin Slabbing	1 percent Edging Trimming	2 percent Kiln Waste
Stumpage per M. feet of.				
regular product. . . . .	\$ 5.00	\$ . . .	\$ . . .	\$ . . .
Cutting and skidding . . . . .	2.25	. . .	. . .	. . .
Logging road operation. . . . .	1.75	. . .	. . .	. . .
Sawmill operation. . . . .	2.00	3.00	. . .	. . .
Dry kiln operation . . . . .	.50	.60	.60	. . .
Planing mill operation. . . . .	.75	1.00	1.00	1.25
Selling and shipping. . . . .	.75	1.00	1.00	1.00
Overhead . . . . .	2.00	.00	.40	.35
Total cost per M. feet. . . . .	\$15.00	\$7.60	\$3.00	\$2.60

The bearing of the above figures in regard to the classes of material that it will be profitable to recover in each class of operation is quite evident. Stock of much lower grade and value may be recovered from sawed waste requiring only trimming and edging, and from dry kiln waste, than from thin slabbing operations. The effect on the daily output of the mill is not so manifest. Following the assumption of the above figures, that in the thin slabbing cuts it will take three minutes to produce a quantity of product that would be produced in two minutes in the regular product of the log, the daily output of a mill normally cutting 150,000 feet of lumber daily in regular product would by the introduction of these waste saving practices be as follows:

	Feet	Sawbill
Regular product at \$2 (96 per cent.) . . . . .	147,686	\$295,372
From thinner slabbing (1 per cent.) at \$3 . . . . .	1,538	4,614
From closer edging and trimming (1 per cent.) . . . . .	1,538	. . . . .
From dry kiln waste recovered (2 per cent.) . . . . .	3,076	. . . . .
Total daily output. . . . .	153,838	. . . . .
Total sawbill . . . . .		\$299,986

From which it will be seen that while the daily cost of mill operation, \$300, remains the same, it has used a smaller quantity of logs and produced a larger quantity of lumber, because of the fact that so much of the waste recovered has not involved additional work of the main sawing machinery, by whose productive capacity the capacity of the mill as a whole is limited.

The aggregate costs of operation from the tail of the mill will of course be increased to the extent of the increased product, and to the further extent of the increased unit costs extended upon the short lumber, as shown in the first table. These factors might be very materially varied (for example, the cost of bandsawing the short lumber might be increased to \$4 instead of \$3) without reversing the situation that the more economical manufacturing method really increases the daily capacity of the mill instead of decreasing it.

#### Market Outlets for Short Lengths

Any extensive saving of short lumber of course requires the development of market outlets whether for factory dimension purposes or for retail sale for purposes for which long lengths are now cut up at the job. As such outlets are developed a further economy in present methods of manipulation in manufacture will be introduced. A board having a bad defect near one end and one edge is edged instead of trimmed, even though it involves much greater waste, because the long narrow board is easier to sell than the wide one. With this question is closely allied the problem of the shop board which carries defective stock a thousand miles to the factory, where the defect is cut out and thrown away at greater labor cost than would have been involved at the mill, not figuring the lost freight cost. On the other hand the factory may cut out the knot or other defect in 6 inches of waste, where the mill cutting to even lengths only would have wasted 2 feet. Even lengths involve a waste on 4 and 6-foot lumber double that on 12 and 14-foot. The mill whose specialized practices have been carefully studied and which is repeatedly referred to in this article saves 5 feet of good lumber in a short board, not by the use of a special trimmer, but by trimming to 6 feet and letting the board carry the lineal foot

of waste until it reaches the cutting saws in the planing mill. In the building trade as well as for factory purposes 5 and 7-foot lengths in many items are just as useful as 4 and 6-foot, and in the necessary progress of the industry this use must as surely be provided for.

It will of course be understood that this article deals only with cost methods of determining the division between profitable and unprofitable waste at the various points where waste material occurs, in the operation of ordinary sawmill equipment. In northern pine and in hardwoods, where the product of the log is very closely utilized, a special pony band or a complete department is often added, working entirely upon the refuse of the main mill.—American Lumberman.

## Letters to the Editor

### Endorses Proposal

Pickering, Ont., January 8, 1912.

Editor of Canada Lumberman:—

We heartily endorse the sentiments expressed in your pamphlet on grading and inspection of lumber, and feel it is high time that something was done in appointing inspectors to place lumber on a uniform grade, as we have considerable trouble with shippers in settling disagreements about the grade of lumber shipped and the grade we ordered. The shipper always claims that the grade shipped is all right. Yours truly,

W. D. GORDON & SON.

### Would Welcome Hemlock Grading Rules

Montreal, Que., January 3, 1912.

Editor, Canada Lumberman:—

Our company would gladly welcome the adoption of grading rules for hemlock as we feel it would put all concerned on a better trading basis.

The conditions in the Ottawa Valley and Quebec are materially different than those of Ontario west and I am afraid it will be some time before the manufacturers and consumers can come to an understanding on the hemlock situation. We hope, however, that the action taken by the trade in Ontario to put in force a set of rules will have its effect and bring about the conversion of all manufacturers and wholesalers throughout Canada. Yours truly,

GEO. M. JANES,  
Fassett Lumber Company, Ltd.

### Hemlock Rules for Ottawa Valley

Fassett, Que., January 6, 1912.

Editor, Canada Lumberman:—

We think that all manufacturers of hemlock on the Ottawa River should get together and decide to establish grades for hemlock—as, as it is at the present time, every mill has a grade of its own, and parties buying hemlock never know what they are going to get in the way of grades when they change from one mill to another. We believe Ontario manufacturers are taking the right step in establishing a grade of this lumber.

Yours very truly,  
FASSETT LUMBER COMPANY,  
Fassett, Que.

### Canadian Railways Using Creosoted Ties

The C. P. R. has made a contract with the Dominion Tar and Chemical Company, a subsidiary company of the Dominion Steel Company, for creosoting for the railway one million ties a year. The work will be done at a new plant near the town of Transcona, Man., where 1,000 ties may be treated simultaneously. The Canadian Northern is to apply a similar treatment to the ties of its railway system, and the creosoting is to be carried out at a plant now being established at Fort Francis. Owing to the growing scarcity and increased cost of hard woods, it is probable that experiments will be made with creosoted poplar ties.

### Great Britain Timber Imports

Imports of wood and timber into Great Britain during the first 11 months of 1911 amounted in value to £24,288,402, against £24,691,402 during the corresponding period of 1910, thus showing a decrease of £453,000. As compared with the corresponding period of 1909 these imports showed an increase of £2,216,370. The imports of manufactures of wood and timber including furniture, during the same period amounted in value to £3,312,021, an increase of £203,709 over the imports during the corresponding period of 1910 and £450,135 over the imports of the corresponding period of 1909.

# The Band Saw

Third Article of Series Specially  
Written for the Canada Lum-  
berman by Hapsburg Liebe.

## The Back

No band, no matter how proficiently hammered and tensioned and toothed, will be much of a credit to the filer who fathered its fitting unless the back is in the correct and proper shape. By the correct and proper shape, I mean suitable to conditions as they exist with the mill on which the saw is run. There can be laid down no hard and fast rule here, for, I repeat, the back, in order that it may do its duty in standing up to the other parts of the blade, must be dependent upon the condition of the mill. If it is too loose, so loose that it flaps badly when the saw is running, it will not be able to do its part—and it is an important part—in guiding the rest of the blade, and will give either way readily. However, perhaps its most marked tendency is that of flying outward from the effect of centrifugal force; therefore, unless the guides to the rear are kept in the very pink of condition, it will lend a quick influence to leading the blade out of the log when entering the cut. If, on the other hand, the back is too tight, the toothed edge will of course be too loose to stand up to its work, and will dodge and lead at the slightest provocation, either of timber or of feed. No amount of good, even tension and levelling can overcome the detrimental effect of a loose front; it will dodge anyway, even with moderate feed, even in the softest timber.

For a mill in good shape, a very little crown is ordinarily sufficient, say, for example, 1/64-inch in every five feet of length. For the mill the wheels of which are worn on the front, more crown is required—for a reason that is too plain to need explanation. Sometimes, however, it has appeared to me that mills, even of the same make and size, whose wheels were fairly true, possessed certain individualities that catered better to one degree of crown than to another. This, of course, is a place wherein the judgment of the filer must be acted upon. To relate one of these inexplicable, freakish occurrences, I knew a filer, a capable and experienced man, who was put to his wits end to hold a position, using 1/32-inch crown in five feet, with the mill and wheels in good shape so far as he could see. The next man, a filer with a score of years of experience, went right in and pulled the backs out to 1/16-inch in five feet, and the saws ran perfectly, cracking only moderately. This, however, is an extreme case, and is an example that should not be emulated by young filers without every consideration beforehand.

Perhaps one reason for the varying degrees of crown required for good work on the different mills, is the varying lengths between wheels; that is, the varying lengths of saw between the points of contact on the upper and lower wheels. There are mills that are coupled short; others are coupled out long. Then, too, the width and thickness of the blade may govern crown to an extent. A little careful experimenting will soon reveal to the filer the best amount of crown for his mill.

## The Crowned-back Band Saw

As may have been gathered from that which I have just written, I am a most ardent advocate of the crowned-back band saw, and I believe sincerely that I can answer with sound reasoning every argument to the contrary. The idea has been advanced that there must of a necessity be a measure of slipping with the crowned-back, through the process of one edge keeping up with the other; or, which is the same thing literally, one edge keeping back with the other. It is an argument easily answered: steel is very sensitive and elastic, far more so than most people would be willing to believe at first blush; when the saw is strained up taut the edges are of nearly the same length through the short edge stretching and becoming thereby tighter. If this is not sufficient as an antidote, the tilt of the upper wheel will take up virtually all the remaining excessive length of one edge over the other. But, perhaps, the best argument for the full back is the fact that it is being used with much success every day.

To go a little deeper into the subject, a saw put up straight on the bench must begin to become hollow in its back from the very outset, it is evident, through the stretching of the front by the strain of the cut, by friction against the sides of the cut, and by the heating of the points as they are doing the work of cutting. Then, it is easily seen, one run of the straight-back saw has caused a deterioration in a degree. My first reasons for being an advocate of the crowned back are: The saw so put up carries with it an antidote for the stretching of the front through friction and the strain it must bear as it is pulled through the log; it offers to the log a slightly

concaved cutting edge if not a straight cutting edge, which must be better than a cutting edge bellying slightly to the timber. This latter named condition is as subtle and effective an invitation to snaky lines as can well be imagined. To say another word concerning the proper degree of crown, which will generally work to satisfaction, and will almost do for a hard and fast rule, the saw, while standing still, should feel to the hand a little looser on the back than on the front. But it should be run for several revolutions, in order that it may find its proper place on the wheels, before this test is put into effect, or the result may prove to be misleading.

Concerning the gage by which the back is fitted, for my part of it I have always used one with three points, the middle point being back from a line formed by the two end points sufficiently to give the degree of crown desired in the saw. As one need never start over the back at the same place, which means that one may begin at random, this method will be found both easy and satisfactory. There is but a narrow space to watch with the three-point gage; with the old-style gage there are five or six feet to keep under constant observation. Also a perfectly even back may be fitted by means of the three-point gage; for but one circle can pass it if one does his duty in the work. The back, however, should be tested not less than every half length of the three-point gage. If a true long straight-edge is not available for adjusting the central point, a silk thread stretched from the end points tightly will show up the space between the central point and the line. The slight adjustment necessary may be readily and quickly made with a file.

## Cracking

This is a malady that comes to all filing rooms, good and bad, big and little, old and new, inevitably. Many fractures may speak volumes against the skill of the filer who is responsible for the saws that carry them; a few may speak volumes in favor of the filer who has them. In the latter case, it may show that the filer is making his saws put into execution every particle of good and power there is in them, running his tension so close and so high in order that he may get a maximum of output, that absolute freedom from cracking is impossible; in the former case it may mean that the fractures are a result of poor fitting or too much weight, or that the mill or track is in bad condition. However, in any instance, cracking is a thing that few of us do not regret to see when it attacks the blades in our charge.

Naturally, the prevention is better than the cure, unless it means a telling decrease in the mill cut. I will add here that I have never seen many permanent cures other than a braze. The causes of fracture, however, when understood, may be watched, and the number of brazes lessened thereby. Still, the causes are numerous—so very numerous, that perhaps no one could name them all. Nevertheless, it is commonly agreed that the chief causes are irregular tension; buckling of surplus metal or strain beyond the capacity of the steel through high tension; too narrow a tire; vibration; case-hardening from running too hard against the guides or from contact with guides made of metal that is too hard in itself, or from having been crowded back upon the cast-iron of the mill base or against the back guard wheel; burning of the throats by an emery wheel too hard for the work, or too hard grinding with a wheel of suitable grain and grade; sharp throats; an unduly heavy weight on the running saw; a mill deplorably out of condition. And of these causes I deem irregular tension one of the most fruitful of evil effects.

But, once cracks have come, they demand the best of treatment, and later the best of care, if one is going to prevent them from going farther into the blade. In the primary step in this direction, several kinds of punches are used to stop the fracture; drills, too, are sometimes used to put holes at the root of the crack; also plain cold chisels have been used to cut almost through the saw to keep the crack from going deeper. Of the punches, the half-moon, or crescent-shaped punch, is not to be despised; also the punch that leaves a long oval indentation is good. Many filers whom I have known used the common centre punch quite successfully—and one of these men used it in a manner sufficiently unique to admit of telling about it. Instead of punching at the extreme bottom of the crack, he punched on either side of the bottom, his claim being that this closed the end of the crack and made the point of bending concentrate to each side of the fracture's end rather than at the fracture itself.

Whichever punch you use, try punching on the end of the levelling block instead of on the hard anvil; the latter jams the little mole-

cles of steel and makes them hard and brittle, robbing them of their elasticity. After punching on one end of the cast-iron levelling block, turn the blade over and file away the little rise that the punch made from the other side. Now punch from this side, and there will be a hole almost through the saw. This done, level both sides and restore the tension let out by the crack and the punching of it. The bottom of the fracture should be regarded as the edge of the saw, and the tire should run inward and around it. It is well to leave a little heavier tire than usually is carried elsewhere, on account of the weakened width. After treatment for fracture, the back should be examined closely, as the punch will stretch the edge upon which it is applied, bringing the opposite edge hollow.

#### Cracks in Centre of Blade

Cracking in the centre of the blade, according to my way of looking at it, is usually brought about through too deep a tension. My reason for thinking thus is that when I had them they were always in old saws, saws that I wanted to make stand up regardless of anything but a good cut, and therefore went farther with the tension than was my wont to go with new blades. Perhaps, too, case-hardening is responsible for many centre cracks; especially when they come thickly in the quarters kept polished brightly by friction against the guides. When a centre crack of any length terminates near to an edge, it should be taken out by brazing, else the little of steel between it and the edge may give way, and the saw be wrecked before the sawyer can stop the mill.

Cracks in brazes should be watched closely, and a joint so affected should be levelled and tensioned frequently. The reason for this caution is obvious; the braze, not having the stiffness of the other parts of the saw, will be inclined to take the curvature of the wheel, pulling almost straight between wheels, thereby concentrating a very sharp and continual bend at the root of the crack and subjecting it to great liability of going farther. It is also well to bear in mind that if a crack in any part of the blade should become deep enough to allow the upper side to hang on a knot on the log or even on the guide, it will result in a completely demolished saw, a thing which may possibly result in injury to life and limb. And it is not an admirable procedure to run saws with as deep cracks in the brazes as in the sound part of the blade.

#### The Other Fellow's Faults in Machine Woodworking

By C. H. Brown

A few days ago a man came after me to fix up some machines for him and to sharpen the knives on all of them. On the way to his place we drove past a man cutting wood, some of the timber he was cutting being for my friend's factory.

He spoke to the wood-cutter about his timber and took occasion to have a look at the cutter's axe. Smiling to me, he asked the man if he ever sharpened his tools. The old man told him he did when he got a chance.

When we arrived at the mill, I thought of the wood-chopper. The mill man was doing exactly what he had found fault with in the axe man—he was chopping with a dull axe. He had only one set of knives each for his planer, the jointer and wood-worker. When they were dull, as they were at times, the machines had to be stopped until the knives were ground, and as there was no grinder, nothing but the plain emery-wheel stand in the usual dark corner, the job was put off as long as possible.

I rigged up a wooden frame and a slide to hold the knife, and finally got a fair job of the set, but it cost this mill man about half as much for the time as a grinder would have cost, and the tools would have been in better condition at that, for home-made wooden rigs are at best but sorry excuses for grinding planer knives.

Yes, this man was chopping with a dull axe, only he did not know it. He had the means to sharpen his axe, too, while the old man was doing the best he could with the means at his command.—Wood Craft.

#### Speeding Up the Planer

By J. Wallace

I don't know that anyone ever tried to see how fast he could run a cylinder before it would burst, like the tests made on pulleys, but it would be worth knowing. It is not likely that the cylinder would let go, because the journals are hardly strong enough to stand as much as the cylinders. Of course, I don't mean that the cylinder would fly to pieces like a pulley does, but how soon or at what speed would it tear loose in its bearings?

I once went in a shop where an 8-inch machine was being tested. The machinist told me they always tested at 5,000 a minute and were intended to run at 4,500. That looked all right, but if I had an 8-inch machine that would not stand for 5,000 in the shop, I would want to send it back home. It was all well enough to talk moderate speed when we had the old many-jointed frame machines

that you could rack apart at high speed, but you can't do that now with the one-piece construction.

The planer I saw being tested at 5,000 was an 8-inch machine. Shortly after that I went into a planing-mill where the keen sound of the planer indicated something extra in the speed line, and I found a 14-inch machine being run at 5,560 a minute and the planer man cussed the darn thing for all it was worth. He should have run his countershaft 850, and he guessed the pulley he had on hand was about right, so he stuck it on the line shaft and got 1,050 on his machine countershaft.

Well, it sounded pretty keen, I can tell you, and when I figured the speeds out for the owner, who was a friend of mine, he got pretty near purple in the face. Of course it did not take long to order another pulley and shut down the machine—all because one man could not figure speeds.—Wood Craft.

## Sanding for Panels and Furniture

### Practical Suggestions Upon a Number of Troublesome Points—Getting the Best Results from Machines

Machine sanding is being reduced to a pretty fine art to-day, and is reaching the point where a great quantity of work is done in the finished state by machinery, whereas in times gone by we depended on machinery merely to do the rough sanding and did all the finishing by hand.

There are several methods of sanding and a great list of sanding machines of various kinds. There is drum sanding plain and simple, drum sanding machines with a multiple of drums arranged in the machine so that it is operated pretty much as the planer. There are disc sanders, and of late years there has been developed a great multitude of modern belt sanders for both flat and shaped work, and then there are quite a number of special sanders gotten up for shapes and special work of various kinds.

#### Straight Flat Sanding

For straight flat sanding the multiple drum machine sander, operated more or less like a planer, is still the most conspicuous in the work. Its greatest field is on comparatively long pieces of flat stock. But, by using endless beds with rubber mats, it is practical to sand short pieces and pieces of various shapes—that is, to sand them on the flat face. In work of this kind there is at first apparently no difference between sanding built-up panels and solid work of flat faces, and a certain amount of sanding logic applies to both. For instance, if one has a lot of work on which the faces are rather rough and require heavy sanding, it is best to do it when fresh, sharp sandpaper is on the machine, and to use sandpaper that is worn more or less smooth for doing work that requires only a light touch with the sander.

#### Difference Between Sanding Solid and Veneered Work

It is in using a sander when the sand drum or belt is worn smooth and has been brought down heavily on the stock and warms it up considerably, that we see certain points of difference emphasized between sanding panels and other furniture parts that are made of solid wood. The heat has no perceptible effect on the solid wood, so long as it does not reach the point of scorching and leaving burnt streaks or spots, but for glued-up work, the heat of heavy sanding will warm the glue under the thin face veneer and sometimes cause the joints to loosen a little, and thus spoil what might otherwise be a good job of veneering.

Just how much veneering is spoiled through sanding it is impossible to say. Also, we must take into consideration that there are two things which may contribute to spoiling veneer work in the sander. One has been mentioned, and another that aggravates or facilitates this heating and flowing of the glue joint comes from the sanding of panels before they are thoroughly dry.

#### Do Not Sand Freshly-glued Panels

After a panel is put up in the glue room and left to stand twelve, twenty-four or forty-eight hours, it is not ready to go to the sander and be finished. This fact is so well known that the average panel manufacturer will tell you that no man, who has regard for the welfare of his work, will think of sending green panels through a sander immediately after they come out of the glue room and are trimmed. They are first piled carefully and allowed time for the moisture incident to gluing to thoroughly dry out.

It is a question, however, whether or not, as a rule, panels are allowed enough time for drying. Let us suppose a panel is built up to  $\frac{7}{8}$ -in. thick, and then assume that in the process of gluing it has taken on enough moisture that the whole mass needs drying out pretty much as one would dry out ordinary air-dried lumber. Now, when a cabinetmaker puts  $\frac{7}{8}$ -in. lumber that has simply been air-dried into his kiln for drying, he is likely to give it anywhere from one to three weeks in a kiln of pretty high temperature, to

drive out the moisture. Now it is manifestly impractical to take these glued panels and put them through a kiln of the same high temperature, because the temperature would melt the glue and loosen up the joints. The general practice is to simply pile them in the air in a warehouse and let the air dry them out.

Just how long it takes air to thoroughly dry out a panel has never been decided. Some panels will perhaps require two or three months to thoroughly dry out and season, and it is doubtful, too, if any panel is allowed to stand that long, unless it just happens to be not needed. The letting of a panel stand for a week will improve it, of course, and it will be more fit for sanding than to take it directly from the glue room and trimming saws, but if it could stand more than a month in a dry warehouse it would perhaps be better.

#### Special Drying for Glued Panels

It would probably be better still to keep them standing in a heated warehouse. Not with the heat raised to a temperature that would start the glue, but enough temperature to hasten the evaporation of the moisture and not disturb the glue joints. The giving of more attention to warming the warehouse or drying room for panels that come from the glue room, so as to insure thorough dryness before they go to the sander and to the finishing room, is perhaps a thing that would improve panels more than anything else. It only needs a little experimenting to determine how much temperature can be carried in such a room without doing harm to the glue, yet hasten the drying process.

#### Make Each Drum Do Its Part

Another important point in connection with sanding and the heat generated is to distribute the work equally among the various drums in the sander, so that no one drum may be doing extra heavy duty and tending to scorch the work. If there are three drums, make them all do their fair share. If there are more, no matter how many, distribute the work as nearly even as possible among the various drums, so that there will neither be scorching in solid work nor heating that will loosen the joint and cause trouble in glued work.

For fine finish in sanding it is just as important to work with the grain of the wood as it is in running a stick through a planer. Just as the planer digs in when it is cutting against the grain, so does the sander make little shoulders and minute broken places in the grain when sanding against it, whereas if sanding the other way it will smooth it down. One may not observe this at first, but after smoothing off and applying filler and finish, one will see that where sanding was done against the grain, the filler has collected in spots and streaks, filling in the small holes made by tearing against the grain, and it produces an objectionable finish to the critical eye.

#### Getting the Right Machines at the Work

There is room for quite a lot of argument about what machine is best for a given kind of work, and one will find manufacturers making a particular machine advocating it for some work, and some one else advocating another machine. Indeed, there are many machines, often, for doing the same kind of work, and sometimes, when one is buying a new machine, it is hard to decide which is best. When one has an outfit of various machines, however, a little experimenting will determine which gives the best satisfaction in different kinds of work. Then when one finds what is best in his own work, follow that, no matter what people argue and say, unless they can show something better. There is no end to the argument in connection with sanders, and the argument does good, too, in that it brings to light various points here and there of strength and weakness, but at times it becomes confusing, and one almost wishes there was not so much of it. If one takes it in the right light, however, and applies it with horse sense to the machines, he can often find points for making improvement here and there so that he can do better finishing with the machines, have to do less of it by hand, and, after all, that is the important thing.

#### Light Sanding for Thin Faces

Finally, here is the point to take particular note of in sanding veneered panels, as distinguished from solid parts in furniture: make the sanding just as light as practical on veneered work. It is not merely a matter of saving the glue joint from heat, but it is more the danger of sanding through the face of a fine veneered panel. Usually the more expensive the veneer used, the thinner it is cut, and many a time an expensive panel is spoiled by sanding through the fine face wood. Whenever this is done there is no remedy except to put on another face. Sometimes it seems almost unavoidable, or rather the trouble is due to not having sanded the core or body before putting on the face veneer. It is due to humps and lumps in the core body, that make it impossible to get a straight, smooth face without cutting through some of the face veneer. For work of this kind the core body should be sanded before the face veneer is applied. Even then, however, remember that the less

sanding one can do to get a finish, the better, and the less danger there is of spoiling the face.—Veneers.

#### Log Run vs. Dimension Stock for Veneer

In the veneer business, the problem of the relative advantages of orders for log run and dimension stock is one of much concern. One of the most practical and interesting considerations of the question, from both points of view, was recently contributed by Mr. B. W. Lord, in a paper read before the National Veneer and Panel Manufacturers' Association. Mr. Lord spoke as follows:

In the first place, in figuring a price on any order for dimension stock, that price is based on how much of that order can be cut out of your logs, and that is determined entirely by the amount of waste. Now, who is going to pay for that waste?

If the manufacturer pays for the waste, he has to make his price accordingly, and if the consumer pays for the waste, he pays for stock he does not get, and, in either case, stock is destroyed and no one receives any benefit for it.

When a consumer uses only a small number of standard sizes it is undoubtedly wise for him to buy stock, cut his sizes and let the manufacturer get out the best he can, but when the customer uses a number of different sizes, and especially when he uses some core stock, if he will figure out what his log run stock will cost him and his labor in cutting the stock to his sizes—and his waste—he will be surprised at the result.

It is not reasonable, or even possible, for an employee of the veneer mill to understand exactly what sort of an inspection some consumer may require in his particular work, as it is very seldom this employee has the least idea what the stock is used for; so that he will either make the stock too good, which means considerable material is wasted, or he will make the inspection too hard.

#### Wishes of the Customer

Another point to consider is that a customer will order stock cut to certain dimensions; then he may change his sizes, or he may take orders for other work that requires different sizes; and either he has to cut stock down, with more or less waste, or else his sizes are so large that his dimension stock on hand is useless.

Almost every dimension order is wanted promptly, and it very often happens that a mill will receive a number of orders for dimension stock at about the same time, and the manufacturer cannot cut them all at once, so there is bound to be delay in shipping some of the orders and, if he tries to rush them out, he hurries his work and his drying, so that some of the stock is unsatisfactory, when, with log run stock, a mill can keep a good stock of both good and center stock and all the standard thicknesses on hand for immediate shipment, and his stock is better manufactured and he can give his customers better service.

From a mill man's standpoint, it is much more satisfactory to cut his logs into log run stock, and he can make larger cuts, manufacture much more economically, systematize his mill better, have very much less waste, and so, by manufacturing to the best advantage, give his customers the benefit of a minimum price.

When a mill man has to select certain logs for certain orders he is very apt to accumulate a certain class of logs, which may mean his best logs or his poorer ones, and these logs will damage, to some extent, or, in cutting dimensions, he is sure to have more or less waste in the ends of his logs, so that, in either case, the dimension customer has to pay for this waste.

#### Expensive and Unsatisfactory

When a customer buys dimension stock, and by changing his sizes or trying to make those sizes into other sizes he joins up a lot of small pieces, it is expensive and unsatisfactory; when, if he buys log run stock, his stock is in large enough sheets so he can cut out special sizes to better advantage, and what stock is defective and not suitable for some work, the sizes are large enough to be desirable for core stock. Then, again, as it takes a certain length of time to manufacture any dimension order, the user does not have to anticipate his wants so far ahead.

This log run proposition has been thoroughly tried out by some of the very largest manufacturers in the country, and two or three have told me personally that their men knew a great deal better what they needed for their particular work than my men did, and, while the man who used that stock preferred to have it bought cut to exact size so as to make less trouble for him, my friends told me they had found it more profitable from a dollar and cents standpoint, to buy log run stock. Every veneer mill in the country burns millions of feet of stock that could be used by the consumer more and more as timber becomes scarce and as the veneer industry develops, and this stock that is burned by the mill is paid for by the consumer. Conservation of timber is the keynote of progress and is being given a great deal of thought and will be given more thought each year.

# The Timber Trade in Great Britain

How the Old Year Left it—Stocks Moderate—Prices Hardening—Consumption Greater—Outlook Bright

By J. Hanmer Quail

Liverpool, January 2nd.—Trade in the principal industries of the United Kingdom at the close of the year was buoyant. Shipbuilding, iron-working, coal-mining, cotton-working, steam engine making and general metal working, were in a state of high activity. The Lancashire cotton trade at the close of the year brought up an ominous cloud over itself by threatening a strike which might involve the greater part of the industry. The question resolved itself into a demand by some of the men, that only workmen who are trade-unionists shall be employed at the mills. The employers claimed the right to employ any workpeople they pleased, who were able to do their work efficiently. Apart from this question the year closed very satisfactorily in the main industries named, and industries which depend upon them. The timber trade depends largely on the others and though not in a state of feverish activity, it closed the year well.

Softwoods are in fairly large consumption, all round. Prime lumber is eagerly bought up, and passes quickly into use. Birch planks have been in good and increasing demand for some months and are now dearer. Canadian and United States oak has sold freely and the inquiry for this is active and very healthy. Oak planks have been in good and well sustained demand and the figures of this wood, for the year, will show a large increase in the consumption, as compared with last year. The demand continues, and will do so while the activity in railway wagon building lasts. To particularize in soft woods, it may be said that New Brunswick and Nova Scotia spruce deals have lately been in larger consumption. Pine deals and boards have sold more freely and were in good demand until the approach of the Christmas holiday. Business has not been as active in the timber trade as in some of the other trades named, but the demand, taking the softwood list as a whole, has not been unsatisfactory, for the last four months, while the hardwood and furniture wood branches have been active.

At London, the demand for deals has been satisfactory and stocks are now light. At the public sales the bidding has been brisk and lots have been knocked down at prices which have been regarded as good. In spruce, lots of Montreal 1st, 2nd, 3rd and 4th qualities have found ready buyers. Floorings and matchings have been well competed for. Floorings of thicknesses from  $\frac{3}{4}$ -in. to  $1\frac{1}{4}$ -in. and 6 or 7 inches wide have been free-selling stock and supplies are now light. Case makers' woods continue in good demand, the activity in the case-making branch being well maintained.

At Liverpool the Canadian import trade is now regarded as closed for the season, but the shipping companies will see to it that the trade is not lost sight of. The spruce market has improved and the deal branch is now very firm. The general tone is healthier and the outlook is brighter. Oak has sold steadily and at full prices. Boards of 1-in. and 2-in. have been in good demand. American quartered oak has been taken up freely. Planks continue in demand and are dearer.

At Manchester, the activity in the cotton and engineering industries and in their dependent industries, in the district, has helped to maintain a steady demand for spruce, yellow pine and pitch pine. Stocks of spruce are now of small compass. Floorings have had a moderately good sale and prices are very firm.

At the Tyne ports, the two chief industries, coal-shipping and ship-building are in active progress, and are keeping up the demand for timber. Spruce deals, squared timber and pit-wood are being taken for the collieries, and similar deals, red pine and teak, chiefly for the shipyards.

At West Hartlepool an improvement in the timber trade has taken place. Inquiries are coming in more freely from the districts around and more timber, chiefly spruce deals, yellow pine boards and pitwood, is being taken. Sawn wood, generally, is in good demand. Railway orders are coming in satisfactorily. Pitchpine has been taken more largely, and stocks are now small.

At the chief Scottish ports the trade shows but little change. Quebec elm has been more inquired for and prices have risen. Spruce is selling more freely. Waney timber has had a good sale and is dearer. Stocks are now within a narrow compass. Oak, in logs and in wagon builders' sizes, continues in good demand and stocks are light. Prices have consequently hardened. As regards the demand, the timber trade at Glasgow is in a healthy condition.

## Stocks in Great Britain

At London and at the principal ports at which timber is received the lightness of the stocks of spruce, pine deals, birch, ash and elm has been a matter of hourly remark among importers and merchants.

The official figures of the importation of timber to Great Britain for the year 1911 are not known at the time of writing, but the figures for the first eleven months of the year, lately issued, throw light on the shrinkage of stocks spoken of. They show that for the eleven months of 1911 the total importation of hewn and sawn wood amounted to 5,251,216 loads, whereas, for the corresponding period of 1910, it was 5,686,839 loads. Here, a shortage of 435,623 loads is shown, which in part explains the present lightness of stocks. The values of the timber given in the returns were, for the first eleven months of 1910, £24,690,402; for 1911, £24,238,402. The decrease in this case, amounting to £453,000, must have meant at least half a million of money less in circulation among importers and merchants, yet it must be borne in mind that a shortage of imported stock like that shown does not necessarily indicate a corresponding loss of profit, or indeed, any loss of profit to importers and merchants at all. Stocks of timber in the United Kingdom had for some time been generally large, so that merchants and consumers had plenty of material to draw upon. With an increasing demand on the one hand, and a lighter importation, stocks were bound to shrink. This they have done, and stocks of the timber named are generally light. In the manufactured branch the total value of the goods received for the eleven months was appreciably greater than in the corresponding period of 1910. The three main classes of goods showed the following comparisons:—

	Jan.-Nov. 30 1910	Jan.-Nov. 30 1911
Furniture and Cabinet Ware, value .....	£370,108	£383,484
House Fittings and Joiners' Work .....	156,525	159,267
Woodwork and Turnery .....	1,551,679	1,769,270
	£2,108,312	£2,312,021

In this manufactured goods' branch accordingly, the value of the goods imported in the first eleven months of 1911 was £203,709 greater than in the corresponding months of 1910. From the standpoint of the timber merchant and of his two excellent customers, the joiner and the cabinet maker, this increase is a matter for regret rather than for satisfaction. Every piece of manufactured woodwork or furniture means to them so much less timber sold for manufacturing, and so much less work for joiner or cabinet maker in the conversion of the timber into fittings or furniture. The importation of manufactured wood goods has, however, been going on for many years, and it can not be said that it has caused serious harm to any main branch of the timber working trade. Joinery and cabinet-making continue prosperous, while side by side with these two old trades has sprung up the great cheap furniture trade of the United Kingdom. This trade has practically made two new classes of skilled operatives of its own; the machine hands who do the ornamental sawing, carving, moulding and turning, by machinery, and the "fitters," who take the carved or turned parts and put them together. This "fitting" is neither true cabinet-making nor true joinery. It is fitting simply, and is a new trade, and a product of the machine era of wood-working. This new trade has come into existence in the face of the importation of manufactured wood-goods and is now fairly extensive and strong. It is closing the year with its plant, machines and workers well employed.

## Export Packing Case Trade

The importance of the packing case trade of London, Eng., may be seen in the fact that the trade has now a prosperous export branch which has a well-established and flourishing association of its own. The Export Packing Case Manufacturers' Association of London, while keeping a watchful eye on matters relating to the trade in general, keeps an especial watch over matters relating to the export branch. For the last fourteen years the members of the association have joined in an annual dinner, and have had a good time on each occasion. The fourteenth annual dinner of the association took place December 9th at the Hamilton Hall of the Great Eastern Hotel, London. Mr. Harry Durrell presided. The proceedings throughout were very enjoyable and the speeches on the different toasts showed the strong position which the export packing case trade had attained, and that an admirable esprit de corps existed among the members. A notable pronouncement was made by Mr. Alexander Sturrock, of the Federal Saw Mills and Case Factory, Melbourne. When speaking to a toast, Mr. Sturrock alluded to the state of supplies of wood for case-making in south Australia. They had no timber, he said, suitable for packing cases. Their wood consisted largely of supplies from Canada and spruce from Norway, while a large amount came from New Zealand. It was evident to those who were present that Melbourne offered a good market to any who could supply case-makers' wood, and it was noted with satisfaction that Canada had been able to obtain a favorable foothold in the Melbourne market. Canada, it was said, would do well to pay special attention to the requirements of Melbourne and other South Australian ports which have no supply of "home grown" wood for case-makers.

Fresh tenders for wood paving continue to be called for by the London County Council and Borough Councils. The Westminster Council are purchasing 68,854 yellow deal creosoted blocks from W. W. Howard Bros. & Company, at a cost of £412 16s. 8d. The sizes required are 3 in. by 8 in. or 9 in. x 4, 4½, 5 or 5½ inches, as specified. Part of the embankment at Chelsea is to be re-paved in wood, and part of the tramway tracks and margins within the area of the Lewisham Borough Council. Wood paving in the London area is, indeed, being adopted rather largely at the present time, and is making a new demand for blocks.

### Liverpool Trade in Canadian Woods

Messrs. Farnworth and Jardine, Liverpool, Eng., in reviewing the timber trade for the month of November, 1911, say:—

Canadian woods—Pine Timber.—Of waney 1st class there has been a large import, chiefly to Manchester, and almost entirely on contract, a large proportion goes direct into consumption; values rule high. 2nd class has been imported sparingly; stocks are moderate and values steady. Square pine.—There has been a small import to Manchester, the demand for this wood continues very limited, but stocks are light; values firm. Red pine has not been imported; there is little demand. Oak.—The import has again been chiefly to Manchester, and as the bulk is contract wood, it will go direct into consumption; stocks are moderate; there is no change in values to record. Elm.—Logs—6,000 cubic feet have been imported to Manchester on contract; there has been little demand for this wood during the past month, but the small stock is firmly held. Pine deals have reached the market to about an average extent; there has been a fair consumption; stocks, however, are ample, both in Liverpool and Manchester, and values are without change. Red pine deals have been imported moderately, but apparently in sufficient quantities for requirements of the trade; stocks are not excessive.

New Brunswick and Nova Scotia spruce and pine deals.—The import to the Mersey amounted to 3,860 stds. compared with 3,300 stds. during the corresponding period last year; about 83 per cent. discharged at Manchester; deliveries have been satisfactory, amounting to 8,860 stds. against 8,330 stds. last year; c.i.f. values have advanced. Values are firm. Pine deals have not been in active demand; values are unchanged.

Birch.—Logs.—The import has been nominal; there has been a fair enquiry at satisfactory prices; stocks are moderate. Planks have been imported to about an average extent; there has been a steady demand, values have improved.

British Columbia and Oregon pine—Only 5,000 cubic feet were imported; deliveries have been somewhat disappointing; stocks, however, are not excessive, and values are firm.

### London Timber Market Report

Messrs. Churchill and Sim, London, Eng., in their review of the timber trade for November, 1911, say:—

The small importation of pine deals during November is about equal to the small importation in November last year, and there has been no noticeable change in prices. The demand has not been at all good, but the high prices can be obtained whenever a small quantity is wanted. Of spruce the importation has been a good deal smaller than usual during the month, and prices have been very firm from a Londoner's point of view. Of the hardwoods, birch timber has been in some demand, and birch planks have been dear, the demand for them being checked in consequence. Elm, ash, and yellow pine timber have been out of favor, ash being at present represented in the docks by a stock of three logs. For oak there has been no transaction, and the 32 logs in the docks at the beginning of the month remain there at the end.

From the St. Lawrence the importation for the eleven months has been, pine deals 369,000 pieces against 556,000 pieces in 1910; spruce deals 728,000 pieces against 968,000 pieces in 1910; birch planks 288,000 pieces against 275,000 pieces in 1910; and from New Brunswick, pine deals 45,000 pieces against 60,000 pieces in 1910; spruce deals 421,000 pieces against 574,000 pieces in 1910; birch planks 231,000 pieces against 311,000 pieces in 1910.

### Barbados Lumber Markets

S. P. Musson, Son & Co., Barbados, B. W. I., report as follows under date of December 30th:—

Lumberstuffs—White Pine—The only arrival during the fortnight is the Btne. "Maggie Belle" from Mahone Bay with 61 M. ft. for which consignees obtained \$30 for merchantable, and \$22 for second quality. The 100 M. ft. ex. "Evelyn" mentioned in our last was second quality, and was sold at \$23 per M. Our market is fully supplied with lumber of this description, and prices will probably go lower if there are any further arrivals. Spruce—The 100 M.

ft. ex. "Evelyn" turned out to be principally second quality, and was sold at \$22.50 and \$18.50 respectively, for shippers, and second quality, while for 51 M. ft. ex. "Maggie Belle," consignees could only obtain \$22 and \$18. Dealers' yards are now fully stocked with spruce, and as we have a large cargo on the way, sold to arrive, we cannot recommend further shipments for the present. Shingles—The Trn. Schr. "E. A. Sabeau" arrived on the 18th from St. Stephen with a cargo consisting of 1,090,750 Extra No. 1 cedar laying shingles and 1,257,250 clear whites, both of which lots had been sold to arrive, former \$2, and latter at \$2.55. No arrivals of Long Gaspe which are in good demand.

### Canadian Lumber in Jamaica

The quantity of lumber supplied to the island of Jamaica, has been considerable within the last few years, no doubt owing to the building operations consequent on the destruction of a large part of Kingston by the earthquake of 1907. In pitch pine there was a slight falling off last year as compared with 1908 but the importation was larger than the year before. White pine and spruce, however, have been supplied in declining quantities since 1907, and the importation is only a little over half of that year's. There is also a falling off in the quantity of cedar and cypress shingles. Nearly the whole of this importation comes from the United States, even in white pine and spruce. Whether any of this lumber is from Canadian forests is not shown in the returns, but a part probably is. Puncheons, shooks, tierces and material for packages have been in increased demand, as the exports of produce and fruit from the island have been growing. The value of the import in 1910 was over £40,000, as is seen in the table. The bulk of the supply came from the United States. In material for packages it would seem that Canada would be a natural source of supply, and an effort should be made by Canadian firms to capture some of this trade. The manufacturers of shingles from Sanata Maria Yoke and Cedar woods is about to be undertaken by a local firm, and the machinery is on order. It is anticipated the industry will be extensive enough to admit of an export trade.

### Active Spruce Trade at Boston

A Boston press despatch says:—The spruce lumber trade has been active, though hampered to some extent by the lumbering districts in northern New England during the summer, and the partial failure of the annual drives. Throughout the year, the market was well sustained as far as values were concerned, though only a moderate amount of new building was going on. In the closing months of the year, the open weather gave an excellent opportunity for outside work, of which full advantage was taken. This brought about an unexpected demand from retail yards, and resulted in an advance in prices which carried values of the better grades of lumber \$2 above those prevailing at the end of 1910. For instance, frames, 10 to 12 inch, are now quoted at \$27 per thousand, against \$25 a year ago, and similar differences are noted in other kinds and sizes of lumber.

### Practical Reforestation at Quebec

The reforestation plan of the Pejepscot Pulp & Paper Company, Cookshire, P. Q., have been found so satisfactory, so far as can be told from the results of their experiments, it is reported, that the work will be continued next summer. About 5,000 new trees will be set out and of these a large number will be of three or four years' growth, which will be imported from New York state. These trees are said to grow more rapidly and achieve their full development earlier than the native product and the experiment is to be tried to see if they will do so in New Brunswick soil. The fire protection system is also being extended and practically the whole property is now wired for the telephone system. Another look-out tower will be erected this summer on a high point for the purpose of aiding the fire wardens.

### Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing us, enclosing stamped envelope, and stating number of enquiry.

1417. **Lumber.**—A large importing firm in Buenos Ayres desires to be placed in touch with shippers of spruce and white pine. Quotations should be for the usual River Plate specifications. This firm could take from ten to twelve million feet per year. They would be glad to hear from British Columbian as well as Eastern, firms.

1424. **Agency.**—Agency wanted for Great Britain for staves, oak staves for whiskey barrels, also whitewood. Large quantities required.

1429. **Wood pulp.**—A London firm asks to be placed in communication with Canadian manufacturers of wood pulp who are in a position to fill orders for regular shipments of wood pulp.

# Berlin "NINETY" Matcher

*As supplied to the Big River Lumber Co.,  
Big River, Sask.*

## CYLINDERS

Berlin fast-feed cylinder heads cannot be ruined. The gibs used are of hardened steel. There are no wearing parts that form a part of the head itself. The size of the spindle next the head shows that it will not spring under the cut. The gib forms the lip for the under side of the knife, thus forming no place for chips to wedge in.

## SIDE HEADS

12-bitted ship-lap or 6-bitted round jointer heads may also be furnished if desired. These heads as well as others may all be sharpened on our Pedestal Side-head Grinder. We have the only 12-bitted side-heads ever manufactured. Side-head jointer is also furnished.

## BELT TIGHTENERS

There are two features about our automatic belt tightener construction that stand out prominent. In a recent test covering a period of nine months, night and day run in one of the largest plants in the world, a Berlin "90,"

a stock-model as above, ran night and day for over nine months and during that entire period **not a single belt was taken up.** Every tightener is automatic, works on the slack side of the belt, and the belts may be released by lifting up the tightener pulleys. These flexible tighteners as compared with the screw method by which terrific pressure and friction is applied to the belt, make a saving of 25 to 50 per cent. in the horse-power required to drive the machine. Belts may be put on endless and run for months and years, without being taken up. There is no unnecessary strain on the belts and the heads will handle the heaviest cuts. The life of the belts is tripled.

## CHAIN DRIVE

In place of the great number of gears which are found on any other matcher, the number of which run up to 30 to a machine, we designed an automobile chain drive consisting of a power automobile chain running over hardened steel sprockets. This applies to both front and rear rolls, reducing the number of gears on the entire machine to a minimum and affording a drive that is positive and will never give trouble. The chain drive used on

# Berlin Machine

Plants : **Hamilton, Canada**

# with Profiling Attachment

*Manufactures Flooring, ship-lap, drop-siding, V or beaded ceiling, partition, casings, base or similar work at 180 to 200 feet-per-minute. Guaranteed.*

erlin fast-feed matchers, by actual test, is capable of transmitting seven times the work required of it. It is practically noiseless in operation and transmits no vibration to the working parts. Every part is protected from damage but is instantly accessible. Belt with tightener connects the in-feeding and outfeeding rolls.

## PROFILING ATTACHMENT

The most simple device on the market of its kind. Consists of two heavy spindles at out-feeding end of machine, driven by one belt, with tightener. Both spindles are carried between double bearings, exactly like that of the roller heads. End play in spindles is automatically kept out all of the time and wear does not effect our device in any way. Cross-adjustment is so provided. The profiling heads are 6-bitted and may be furnished for all styles of work and the tightening operation self-centers them on the spindle. Changes for different runs may be made in a few moments time. Jointing devices for top and bottom heads are furnished and the knives may be changed no matter what form they take.

## FRAME OF MACHINE

Cast-in-one solid piece, affording the sturdiest foundation a machine could run on. While some say there is no advantage, the real reason is that no other wood-working machine foundry has the facilities to cast matcher frames in one piece. Any practical man can see that with the one-piece frame and the weight properly proportioned, the vibration is considerably lessened and the machine will always be in line even if the floor sags a little.

## FEED-ROLL POWER

Spring tension on all feed rolls, thus automatically regulating the pressure on stock as well as feed power consumed and removes all jar so common on weighted roll machines by the entrance of heavy stock under the rolls and again when they drop off. Springs are adjustable to suit any weight of stock of varying thickness.

## SPEEDS OF FEED

Guaranteed to turn out perfect flooring and ship-lap at 200-feet-per-minute and handle formed patterns such as drop-siding, partition, base, casings, etc., at from 150 to 180-feet-per-minute.

# The Retail Dealer and His Problems

## Short Lengths in the Retail Yard

By An Old Timer

I want each one of my readers who is not still clinging to and indulging too freely in the "all sixteen" habit to please rise to his feet.

Thank you. Just remain standing one moment, please. Now I wish to ask those who are still sitting but who feel from the very depths of their hearts that they should break away from the "all sixteen" habit, to please rise. Well, look at that, will you? Nearly every one of my readers is now upon his feet. But say, you fellows back there in the rear, why don't you stand up? Why do you sit back there with your woebegone, sour look upon your brow and card your lilacs with your long, slim graspers? Where do you fellows hail from, anyway? (A wee, small voice pipes out from the back seat, "Missouri.") Well, what do you think of that? I suppose then that you wish to be "shown." All right, gentlemen, just draw your chairs up close to your uncle Hem, and I will try to "show" you why it is necessary and why it is your own interest to divorce yourselves from the profit reducer, the "all sixteen" habit. (You may all be seated again, please. Thank you).

### All Call for Sixteen Foot

Just to begin with, let me start this way: If the customers who enter your yard and those whom you have the pleasure of serving are like the ones who trade with us, waiting upon a class of fellows who seem to have been born with a craze for sixteen foot lengths upon their minds, in place of silver spoons in their mouths, and putting it down in black and white, I will say that nine men out of every ten, yes, ninety-nine men out of every hundred will call for sixteen foot lumber and dimension when they expect to cut same into short lengths. They either do not know that it is possible to obtain short lengths or else they really enjoy sawing the long lengths to the lengths desired.

Just a few days ago a farmer brought us a bill to be filled, and among the list of items wanted was 100 pieces 2x4 by 16 ft. and 60 pieces 2x4 by 12 feet. I at once inquired of him where he was to use these 2x4's, and he went on and explained that they were all to be cut into four, six and eight foot lengths. "Well," says I, "what is the matter with us filling this part of your bill with six and eight foot lengths and save you all that unnecessary labor of cutting?" "Good work, old head," he remarked. "I was not aware that 6 and 8 ft. lengths were carried in stock." Then I told this man that whenever he could not find the short lengths at "our yard" it would be when some other fellow had full swing over the whole works, for so long as I am purchasing agent I expect to keep in stock plenty of the short lengths, for it does not only save you time and labor in resawing, but you also save money in the purchase of short lengths. When this customer found that it was possible to purchase the desired lengths at less money than the longer lengths should have cost him, he acted as if he had struck each of his "funny bones" at the same time. He smiled all over, and his long felt sixteen foot want was filled with satisfaction to him and a better profit to us. Do you know what this little inquiry as to where these 2x4's were to be used meant to us. Well, sir, those 100 pieces 2x4 by 16 cost us in our yard \$20.27. The 60 pieces 2x4 by 12 cost us \$8.16, making a total cost of \$28.43. Had we filled the bill with same lengths as were specified upon bill and at our regular retail price, these items would have totaled a cost to this purchaser of \$34.11 and a profit to us of \$5.68, or in other words, 20 per cent., but by just a little inquiry and forethought we substituted the short lengths, pleasing the customer far better by so doing, as we gave him a cut of \$1.00 per thousand in price, and what is the answer? The same number of square feet in short lengths cost us \$21.86; these were sold as stated above at a one dollar cut under regular price of 12s and 16s and cost the purchaser \$32.57. The total amount in money received by our company was \$32.57, and our profit was \$10.71, in place of \$5.68—almost double. Now will you be good?

Then again, we are all confronted at times with some little problem which comes up, and we scarcely know where we are at. Certain seasons of the year we are very apt to run short on certain lengths in certain dimensions, caused by a much larger demand on these certain items than we had anticipated. Every one seems to take the "notion" at the same time that they must build a corn crib and granary. They all build about the same height, size and capacity, and this makes a large draw on certain widths and lengths, and we find the demand is such that the supply is soon exhausted.

Now the question comes up, what can we do at such times in order that we may fill all these bills? Can we receive any aid from the short length bins. Let us look into this a little further and see. The last few weeks it seems as though we have been rushed to the limit filling corn crib and granary bills. Every farmer living in this section of grand old Iowa seems to be long on the golden grain and short on crib room. The result of it all was that we have worked early and late trying to supply their needs in lumber. We have figured so many such bills that we can almost tell a man just how many 1x4s cracked one inch apart will be needed on any size crib from a 2X corn crib to a 3X granary without touching the point of our "Mephisto" to the estimate book. Everyone seems to be wearing a crib countenance. I figure cribs by day and dream of cribs by night. But this rush of trade is what makes the lumberman grow stronger instead of older. We all like to be busy loading out any kind of material so long as we can see a nice profit in it. But when we bump up against a nice large bill and are very anxious to land same, but by reading over the list of items needed we find that there are some mentioned upon the list that we are short on, this causes our old faces to draw and become twisted with an "isn't there stare."

### It Got the Bill

One day last week I received a bill to figure for a large double corn crib and granary, and this bill was handed me by a man who lived at what might be called the "half-way place," or the four corners. It was a toss up to know as to which territory he did belong as his farm was so located that it was almost an even pull for him to haul his lumber from four different yards, representing as many different towns. He had good roads in each of the four directions, and the greatest difference in distance would not exceed one mile. This bill which was presented was made out by a carpenter who was already employed to do the building, and he had instructed the buyer to see to it that no change was to be made in size or plan of building and all items furnished must be of those grades specified. The retail lumber dealer who had the best material at the lowest price stood a pretty good chance of filling the bill. All that was needed in this bill was to be in yard not later than 7 a.m. the following morning, as he stated that wherever the bill was bought enough teams and wagons would be sent to haul the entire job out at one trip. I was wise that I was on the ground floor when it came to "quality" stock, and I was quite confident that I could adjust the "Parker Fountain Point" to such a fineness that my figures would appear pleasing, but when I saw where the bill called for 100 pieces 2x6 by 20 feet (far more than I had in stock), flit-flat-flutter went my old blood pump. His icy words "All material must be on hand by 7 a.m. the following morning," and also his remark, "Don't push your pencil unless you can deliver the goods," made Uncle Hem. shake down his grate, open up the direct hot air blast draft and get the oven good and warm before I put in the dough. I was busy "kneading" my thoughts and "knitting" my brow at the same time. I finally whirled the office chair around, facing him, and putting a nice large, fat worm on the hook, I threw it out close under his food receiver and waited for a nibble as I asked him where these 2x6 by 20s were to be used in the crib. (I, too, at that time was wondering if I had enough 22 or 24 foot sticks that I might substitute at a profit for the 20s). The only feeling that I could compare this awful suffering to was once, some years back, when I was a "boy," I was walking as proudly as any young man can walk when he has a fair maiden hanging onto his arm, and as we marched toward the opera house expecting to be comfortable seated within the next few moments in a "box-seat," we single filed up to the ticket window and I called with a voice of a millionaire for two box seat tickets, at the same time pushing my right mitt into my trousers pocket in search of the coin. But lo and behold you, the further down my hand went the emptier my pocket felt, and I side stepped and began a general search, but could not locate a "soo." I then remembered that in making my "change" I had failed to change the change from my ready made to my glad rags, and the change that came over me at that time was not at all pleasant, by any means. Then came the thought, "If you haven't the real article, produce a substitute," and I at once got my fingers on a blank check and saw the grand opera through this "substitution." Never for once give up the ship; if you haven't the "20s" splice, break joints, or manage if possible to land any bill that comes your way. Never say die until you are flooded with embalming fluid. Get motion, keep in motion and keep going. As it was, I was started. I had the bill to figure, and

thus far Alphonse was not wise that I was short one single item. He did not need to know that I was short on long stuff and long on short stuff! and when I placed this question as to where these twenty foot pieces were to be used, he answered back, "Rafters. They are to be cut to nines and elevens." "Glorious," thought I. "My life is saved. I see my way clear. I will fill this bill if I can land it with 10 and 12 ft. sticks." I figured fine, and upon totalling the last column of figures I told Alphonse with as mild a voice as I could that I would agree to furnish him this bill for so many dollars. "You have sold something" came from the lips of the prospect, and with this remark he left the office, and as he was driving away he called back, "I will be on deck with my man and teams in the morning and haul out the job." Now, let us do a little figuring and see how we came out in the financial end of the deal by making this change. One hundred pieces 2x6 by 20s, or 2,000 feet, cost us \$42, and as this bill was figured at 10 per cent. above in yard cost, we had sold these long lengths for \$46.20. We furnished in this bill 100 pieces each 10s and 12s, thereby making a total in feet of 2,200, showing a loss in feet of 200, but in yard cost to us on these short lengths, \$36.30, we received the same price per thousand, the same total in dollars we would have received for the 20s. You can easily figure for yourself as to what our gain was in the exchange. Six foot one by four number one fencing costs \$2 less than twelve, fourteen and tens and nine dollars less than sixteen; the eight foot will work just as well on the ends of eight foot cribs as sixteens, and a few sixes and eights can be worked in on the sides just as well as all long lengths, and if you will but furnish these short lengths, as you are loading out your customers it will not hurt them in the least and it will greatly aid you in making a better profit on each bill you can furnish in this way.

You can work the same deal on six and eight foot drop siding. Add a few short lengths in B & C white pine finish in your next car. Don't load up too heavily with short finish, but you can always manage to work off a little short length finish in the course of a building season. You will also find that you can handle short lengths in fir flooring and ceiling, thirty-two inch lath. Quite often the retail man is offered some good snaps by traveling salesmen.

### The Traveling Man

And here is just where I wish to speak a good word for these traveling men. I was in a place of business just a day or two ago and while I was in this large store a nice, clean gentlemanly traveling man approached the buyer of this store and presented his card.

Well the reception that this business man gave the traveling man was cool enough to frost a pie-pumpkin. Now this merchant treated the traveling man worse than I would treat a sick setter pup. He cut him off with some hot, sharp words, "I haven't any time to waste on you drummers. You needn't open up that case of yours for I will not monkey a minute of my time with you." Now put yourself in the traveling man's shoes and just imagine how you would feel if you were to be greeted in this manner. I myself, wouldn't be long in handing such a stranger a "heart-to-heart" talk and before I left his store or place of business he would be convinced that I had no more love for him than he had for me. And I think that right here is where a great many men who claim to be good business men make a sad mistake in turning traveling men down. They very often have something good to offer in the way of price or may have some snap in some item that you can use to a good profitable advantage in your yard. We can not very well buy from each one who calls but we can act the man and offer a chair and a moment of our time if nothing more and we sure are not going to do anything wrong when we meet and treat the traveling salesman as a man. There is a great amount of information these fellows can give you and can fill you often with good pointers that will aid you in getting on the inside of different deals and will also explain different systems of conducting certain parts of your business that means good, big dollars to your bank account. There are a few men engaged in different lines of business who think that all the traveling men have to do is to make their towns, take all kinds of kicks and slurs, have an easy time at the expense of the house which they represent and draw their salary at the end of each month. But let me tell you the man who carries the grip, travels by night as well as by day, eats whenever he can, sleeps not just when he would like to but whenever he can between towns and in all kinds of beds, keeps going and calling upon his trade whether he is ill or in good health, and is not by any means having a snap as one might think. This man is out to sell lumber, sash or doors and if he holds his job it's up to him to make good. He cannot expect to hold his position any length of time unless his order book shows that he is an active member of the firm for which he is traveling. Of course there are times in all of our lives when we feel that we cannot spare very much time upon certain days to traveling men. But did you ever stop to think that it does not take up one second more of your time to meet and pass the time of day with these fellows in a nice, gentlemanly way than it does to open up your

grouch pouch and pour forth a bunch of short, mean, ungentlemanly remarks? And, too, you will find that at times your actions and treatment to these fellows is being watched by some one who perhaps is one of your own best customers. There is nothing that would sour me any quicker on any business man than to hear him explode and snub some fellow who chances to call upon him just because he (the business man) might happen to be so busy at the time this call was made or perhaps just to show his ill manners and poor raising. No Sir, I do not like to see this done for it makes me think that this business man is naturally grouchy and that all the kind words and smiles he offers to his customers are counterfeits.

### Bores Do Not Get Business

'Tis true that we all are at times bored to the limit with peddlers, graft agents, shoe string and pencil venders and also subscription solicitors and magazine agents. But we do not need to patronize them all, neither do we need to use them "beastly." My own patience was tried one day this week by a lady soliciting subscribers to some monthly magazine. She called at the office and found no one there. Then she came on out into the yard and found me almost snowed under with business. She introduced herself and her business and wanted me to look through her magazine. I told her that I was too busy just at that time as there was at that time seven teams waiting to be loaded out. Still she followed me around the yard asking me to please stop and look at her paper and I kept saying "No" in as gentle tones as possible but still she insisted upon me stopping to make an examination. Now I am receiving far more magazines and papers than I find time to read, but had this lady waited until I was at liberty and had a few spare moments of my own I no doubt would have looked through her paper whether I subscribed for it or not, but when she kept dogging my footsteps and overdid the act of trying to get me to put all other business aside and listen to her story she curdled the pan of milk then and there. I wouldn't have given her 50 cents for a year's subscription if she had offered me a \$1 cash premium. No sir! She went so far that she completely disgusted me, but at the same time I used her as a lady. But after she had left the yard and I had finished my yard work so that I could return into the office I thought of how some prospect who is in the market for a nice big bill of lumber is at certain times bored in the same way that I had been bored by some lumberman who was overly anxious to make a sale or close a deal for a big job. It's all well enough to have a follow up system and keep close watch on all prospects but we must use good common sense along with our anxiety and be very careful that we do not call too often upon those whose names appear upon our estimate book. The farmer has his busy season as well as the merchant, lawyer, doctor or contractor and builder, and there are those among their number who would cut you short off if you were to follow too closely in their footsteps begging them to buy from you.

### Watch for the Snaps

So men, be fair with the traveling men as you are or should be with your customers for as I have already stated in this writing these traveling salesmen have a good live "snap" for us. Now to those who do not thoroughly understand the meaning of the word "snap" let me explain: Webster defines "snap" as follows, "to break short, to crack, to bite, eat, to sieze eagerly." I define snap a trifle differently from Danny. A "snap" you know may be of the lemon or ginger variety, then again it is that part of the harness that fastens the line to the bit and is used in guiding the footsteps of your skate to a road or path which leads to wealth and happiness. Most people say that the person with little to do, plenty to eat and plenty of coin lives a life which they call a snap. But a "real" snap is that which enables one to purchase Big Values with little coin and it is through these traveling salesmen that oftentimes we are made wise to a short length proposition that can be had for little money and it's up to us to keep our eyes open and our hands ready to grasp any good profit producer that proves itself to be a good thing.

"Gotch" says, "Just why I have attained the world's title at grappling is because I have always aimed to travel the route in short time and work harder than has been the case with the other fellow." He then goes on to illustrate: "When I beat Tom Jenkins and won the American belt, I was against a man of superior generalship and huge strength—but I was more durable at the end of thirty minutes than he was. The fellow who can travel over the long course and still be fast and strong always has it on the other fellow—granted strength is anywhere near equal."

So if we can conduct our lumber business in such a way that our fast work will show up the profit we will stand a pretty good show all right of wearing the belt with these words printed thereon: "The wearer of this belt is in every way a wide-awake, up-to-date know-how, does-do retail lumberman." And even if our competitors are stronger than we are in a financial way yet if we can

and will use some method in our buying and selling which will produce good fat profits from the short length counter we stand a pretty good show of holding the big guns equal in the profit and net-gain race at the end of the year.—The Lumber World.

### Difference in the Methods of Stocking Retail Yards

Methods of stocking yards vary with individuals, and it is not unusual to find dealers in the same town whose views are wholly dissimilar regarding credits, collections and other features of yard management, says the American Lumberman. It would perhaps be impossible to find two yardmen whose ideas were cast in the same mold. Diversity is the rule here as well as elsewhere, which is a wise provision, as without it there would be monotony, and inability to learn, one from the other.

Stock sufficiently large to meet the demands of trade is the desire of all retail dealers, and this is accomplished in different ways, it being much more difficult in this age of the retail trade than it was before lumber was drawn from so many sources. Rarely is there a yard now the stock in which does not include lumber from the South, the West, the white pine district, and often from the territory from which poplar is obtained, which means that owing to the distances the demand must to some extent be anticipated in order that it may be met.

In a certain 2-yard town one of the yards carries a stock that ordinarily would inventory \$10,000; in the other the footings would show nearly \$15,000, and the dealer carrying the smaller stock jocosely offered to wager his competitor a suit of clothes that he could come as near filling any bill that for the occasion a contractor of the town would make out as could his neighbor. He was asked how he could expect to do so, the reply being that his was by far the best balanced stock. He was careful when ordering any item not to "overdo" it, as he termed it. In his competitor's yard he was sure there were certain items in such abundance that a portion of them would be unsold twelve months later, while if in his yard any purchase should remain on hand half of that time he would think he was deficient as a buyer. It was unusual for him to buy any one item in carload lots; he ordered in quantity that would fill part of a car, and filled the balance of the car with some grade that was getting low, and that would be required in the near future. It

will of course be understood that dimension is bought in carload lots, but with the exception of boards every other item in the yard is bought in smaller quantities.

That dealer dwelt on the importance of keeping a well balanced stock, and thought that not one lumberman in a dozen pays sufficient attention to that phase of yard management. "I could invest 50 per cent. more in stock than I have at present and be no better fixed for filling orders," he said.

The method of another dealer is to carry as small a stock as will answer his purpose, and this is accomplished in a way that is extraordinary for its rarity. As fast as pricelists, or special offerings, are received they are placed on file, and when an item of stock is wanted he knows generally without soliciting prices where he can get it to the best advantage. There is no time wasted hunting for it. The hour he discovers that a particular item is short, the next hour he can order from a concern that is liable to have it. Oftentimes when ordering the mail is too slow for this dealer, so not infrequently he wires his wants, believing that the time saved by so doing more than compensates for the cost of the telegraph service. If the concern does not have the material required, and the stock of this material in his yard has almost reached depletion, he asks that the information be wired that he may order elsewhere. Orders also are given subject to prompt shipment, and when he says "prompt," he means it. In this way he can replace in the shortest possible time any part of his stock that is low, and keep his stock complete with a smaller investment than was the case when he did not keep the pricelists and all special offers directly under his thumb, and relied upon the mails instead of the wire. That by skillful ordering the investment of the average lumberman may be reduced 10 per cent. he has no doubt, though herein lies danger of broken stocks.

Large stocks are often a result of buying what may be called "snaps." Because a lot of lumber is offered at a reduction it is taken on. A lot of No. 2 flooring was seen in a yard that was bought in this way and had lain there nearly a year and a half. Whether the reduction was a sufficient recompense for the interest on the investment depends on the price and on the way the proprietor looks at it. Most dealers prefer to turn their stocks as many times in the twelve months as possible.

## CAMP DEPARTMENT

### Varied Methods in Logging Camps

The methods of lumbering as carried on throughout the United States and Canada are as varied and perhaps more so than any one branch of our industries. If, for instance, an up-to-date lumberman from Canada, the State of Maine, Michigan or Wisconsin, where operations are conducted somewhat on the same general lines, should happen to change his location for the South or West, he would need to discard most of his old methods and practically learn the business over again. The sleigh could not be used in the South, nor yet on the Pacific Coast, where the enormous proportions of trees would make the average man feel helpless, he being a stranger to such gigantic specimens.

When I made the Pacific Coast my stamping ground some years ago the regulation log road was cut from 25 to 30 ft. in width. The peeled logs of perhaps 18 in. to 24 in. diameter would be imbedded about half of their thickness in the soil crossways of the road and spaced about 7 or 8 ft. apart with a notch cut to a depth of 4 to 5 in. or the upper part of each "skid" in the center of the road. These notches served the purpose of keeping the logs from swerving from side to side as they were hauled tandem fashion like a string of railroad cars, one log "dogged" to another until—well, I won't say anything about the length of the string, as some of the readers might conclude that I have very little respect for the truth. These logs would always be peeled and a "snoot" cut on what was to be the underside when peeling. The skids were always well greased, it being one man's duty to carry a pail of grease and sweep each one of the skids.

One man called the "bull puncher" would handle as many as 12 or even 14 teams of oxen and the pay these "bull punchers" used to get would make a good many professional men feel like changing their occupation and following this line of work. The oxen were usually fed and taken care of by other men, the labors of the drivers ceasing as soon as the barn yard was reached at noon and night. While on duty they would invariably be accompanied by a "chainer."

The railroads on the Pacific Coast as well as in other parts of the country have to a great extent revolutionized lumbering so that systems which used to be the regulation just a few years ago have now become the rare exception, with the result that at the present time a great many of "Mr. Bull Puncher's" skid roads have given way to a greater number of cross ties surmounted with rails of steel over which run modern log cars propelled by steam or gasoline, especially designed to carry the same old giants of the forest from their long peaceful homes; possibly to the same old "landing" that was so frequently visited by "Mr. Bull Whacker" in the days gone by when the air rang with the stentorian notes of his husky voice, the echoes of which have since died among the surrounding hills, as he has no occasion now to raise his voice to such a pitch that an auctioneer's "speel" would sound like a whisper in comparison.

The felling of timber in different localities has been as varied as the hauling. In a good many parts the standing trees are notched with axes for felling, the scarf being cut on the side to which the tree is intended to fall, and sawn the balance that is necessary, wedges being driven in behind the saw to keep it from "pinching" and also to throw the tree in the proper direction. Two men operate a cross-cut saw, standing "over it," as one would say, with the teeth toward their bodies, and it seems miraculous with what precision a tree can be thrown by proper notching and sawing. In some cases it is necessary to saw through to the notch on one side and allow the other side to hang in order to give the tree a twist whilst falling to avoid lodging on some other tree or trees. The gyrations of such a tree must be anticipated by the lumbermen or a good part of their labors will be for naught and the wood be left in a dangerous condition with lodged trees "hanging up" and which are liable to come down with the wind at any time.

When I was in the South it was the custom to chop down the trees the same old way our northern great grandfathers practiced. The cutting of cypress logs is about as wet a job as our northern river driver has when floating the logs down stream to the mills. As the home of the cypress is in swamps where the depth of water

varies, lumbermen must use rafts or flat bottom boats on which to work, as the bottoms of the swamps are scarcely more buoyant than the waters over them. However, he sometimes has the advantage over his northern brother in that his logs are already in water that is deep enough to carry them to the mill.

Some kinds of timber growing along the Pacific Slope are so tough and gnarly for a considerable distance up from the ground that they are chopped off several feet above the ground, the chopper using what is called a "spring board" on which to stand while up in the air doing his work. This spring board, if memory serves, is about 4 ft. long and about 6 ft. wide, with one end tapered a little from both edges, on which is fastened a horse shoe with the heel calks about even with the narrow end of the boards and standing off from it a notch or pocket is cut almost square into the tree the depth of the axe bit and slightly wider than the end of the spring board, so that a man starting from the ground cuts his first notch some distance up, inserts his spring board with the calks of the horse shoe pointing up to keep it from slipping out; then he gets on to his board and cuts another notch, using another board. He can in this way rise to any desired height by pulling up the lower of his two boards and using it in the upper notch that has already been cut. This may seem to a great many a dangerous business—to scale up one of these monstrous trees and stand on a small piece of board to chop away till the tree falls. It is dangerous, but the men get used to it.

### Patrol and Fire Fighting

F. J. Davies, Coeur d'Alene Association

After six years' experience as chairman of the fire committee of the Coeur d'Alene Timber Protective Association, during which period I have spent a great deal of time on the fire line and among our patrolmen and fire fighters, it seems to me that the most important thing in fire protection is the receiving of a report of the location of the fire promptly upon its breaking out. To this end we maintain an adequate force of patrolmen. These patrolmen are located according to the topography of the country, their patrol districts being arranged so that each has one or more natural lookout points from which patrolmen may view the entire region over which they are in charge. These districts vary in size from twenty thousand acres to as high as sixty thousand acres, according to the topography, liability to fire and the ease with which they can be traversed. Our patrolmen are equipped with light axes, short handled shovels, with round point, and small sized water bags. In settled localities the patrolman works singly, making his headquarters with some settler at a certain point within his district, and ranging from that place to the lookout points and thence over his district. In the unsettled portions of our association district we furnish camp equipment for two men and place two patrolmen together, their camp being at some convenient point from which they range in opposite directions, to meet at the headquarters camp in the evening.

In getting early information from our patrolmen as to the location and extent of fires, we find the telephone the best means of communication, and for this purpose we recommend the building of local lines.

The class of labor employed should be the very best obtainable, woodsmen and rivermen preferably, as they are accustomed to moving around in the timber and are less liable to become excited or nervous should a fire prove to be a bad one, and they are thoroughly versed in the use of fire fighting tools.

There has been much discussion as to the number of men to be employed at a fire. Our experience leads me to say that it is almost impossible to get too many men on a fire line; it is much better to send twenty men to a fire that ten could control than to send ten men to a fire requiring twenty.

In addition to this, the care of a fire after putting it under control is constant vigilance and the burying of smouldering roots or logs, cutting down all the stubs within the fire line, if the ground is open, and if in heavy timber the search for and falling of defective trees, in which if the fire gets started it will continue to burn for months and will at some time break out in flame.

In all this work it is understood that the warden has personal knowledge of his district; that he has made preparations to furnish tools, camp equipment and supplies on short notice; that he has located within his district or nearby certain men, such as logging crews, and has arranged with the proprietor of the works to furnish him with men upon request and that he is thoroughly familiar with the best and quickest method of transportation to all points within his district.

There has been considerable discussion among members as to the best methods of working men. Our experience is to work them by the hour, rather than by the day or ten hours, paying overtime in such cases as may be required by the exigencies attending. We do not recommend night work or overtime. Fire fighting is hard

work and if a man puts in ten hours of it it is all he can stand day after day. Night work is unsatisfactory and ineffective, as men cannot see to do good work and will not make the same effort they will in daytime. The only night work we recommend is watchmen for the fire while other men are resting. The ideal time to fight a fire is from daylight until the middle of the forenoon, when the wind usually rises, beginning again about four o'clock in the afternoon and working until dark. These hours have their drawbacks in that it is hard to get men who will take their rest in the middle of the day, and we have been unable to regularly follow this plan successfully.

We think the wages paid fire fighters should be a little above local wages paid to woodsmen, but not enough higher to suggest to an unprincipled man the setting of fires to prolong his job. In Idaho the compensation of fire fighters is fixed by law at \$2.50 per day and subsistence; this we consider fair wages for the work.

I can not lay too much stress upon the advantages of paying the men at once upon completion of their work, as we have demonstrated beyond a doubt that by this method we are enabled to get better men and to get them when others, who could not pay in negotiable paper, were unable to get help.—Address delivered before Western Forestry Conservation Association.

### Lighting Logging Camps

By E. H. Corbett

There is no question but what the modern and keen-sided manager of logging camps is endeavoring to decide on the best equipment, not only for the operation of getting the logs from the woods and placing them on the cars but also the most advantageous way to run the logging camp itself. He considers first the hygienic possibilities so that his men may be comfortable and healthy and with this in view he cannot overlook the fact that the camp must be properly, economically and safely lighted. It is an accepted fact that this cannot be accomplished by steam as steam requires services of a competent engineer, greatly increases the fire risk and is rather high in first cost. As acetylene and gasoline lighting plants require extra fuel, increase the fire risk and require skilled attention what is left therefore but the electric storage battery and generator plant? It is possible to install a plant capable of furnishing any number of lights from 10 to 1000. This plant would be made up of a gasoline engine driving a small generator in conjunction with a storage battery, switchboard, etc. With this plant it is possible to run the engine only two or three hours a day and in some cases a few hours a week, storing up sufficient energy in the storage battery to run the lights for the entire period of need. These plants are so arranged as to be run on low voltage with special Tungsten lamps. These lamps are made with heavy filaments and will stand rough usage and are not delicate like the ordinary Tungsten lamps for high voltage systems. The battery furnished with these plants is one of the best on the market and selected for durability rather than for cost. About 50 per cent. of the railroad companies in this country are using them to-day for their block signal stations. The batteries require very little attention and as the dynamo with which they are charged is the proper voltage for charging there is no danger of damaging the battery with too heavy a current.

The great advantage of these plants is that the camp can have lights at any time whether the engine is running or not. The complete outfit is made to take up a minimum amount of space. It is simple in operation. When we say this we absolutely mean that it is fool proof. The gasoline engine is of the heavy duty type and can be relied upon to run at any time, either day or night, with a simple turn of the hand.

A better lighted camp means more satisfied employees and more money to the logger.

The cost of these plants is very moderate, running from about \$7.00 to \$10.00 per light. This includes complete plant ready for installation and operation.

### The Camper, Settler and Hunter

At the recent convention of the Western Forestry and Conservation Association at Portland, Oregon, Mr. A. P. Sprague spoke upon the above subject as follows:—

The extent of the menace to which we are subjected by the camper, is a matter entitled to our serious consideration, for as long as we have forests that offer attractions to them, they will come. They are in a sense our guests.

Amongst the younger set who annually respond to the call of the wild, we find more of a reckless tendency, an abandon of restraint as soon as they are past the last house, and a careless lack of consideration for the preservation of this woodland that attracts them, and for the perpetuation of its streams and game that they prize so highly. Generally this class consists of a parts of boys—a bunch of schoolboy chums who have talked of, planned and an-

ticipated this trip for months, and of an age when their energy must find an outlet. They are more apt to use our fire notices for a target than to read or heed them.

Settlers are being attracted from all parts of the country; many of these (coming as they do from an untimbered country) need much instruction along lines of forest preservation, which to them means self preservation, lest in their ignorance they unmeaningly do much harm. I have found that this class is inclined to resent the restrictions placed on burning—it is natural that they see in the law no further than that it hinders them from carrying out their land clearing plans; but most of those whom I have come in contact with have failed to even read the Forest Fire Law, though copies of it were handed them. I strongly advocate an examination by a competent board of all men applying for positions as wardens, as to their abilities along the most important requirements, such as tactfulness, executive ability, woodmanship, familiarity with the Forest Fire Law, etc. These men are the guardians of our property and of the public welfare and should possess a high standard of intelligence, and command respect in their community.

Under the head of the hunter we have our most serious fire factor. The settler we know where to find; the camper does not usually penetrate the woods, but sticks to the streams or established camping grounds that are easily accessible, but the hunter goes far back in the hills, is not long at one place, making it impossible for our wardens to keep track of, or place any responsibility on him. He is a despoiler to begin with, he has no regard for preservation or he wouldn't be a hunter. It certainly seems most inconsistent in the face of the efforts for conservatism, to permit hunters to go into the mountains in the middle of our dry season. The relative proportion of this hunter's interest in hunting compared to the great amount of property and life placed in jeopardy is so ridiculous that it is marvelous.

### New England Trees in Winter

A valuable bulletin upon "New England Trees in Winter" has been published by Storrs Agricultural Experiment Station, Storrs, Conn. The bulletin contains an interesting introduction dealing in a general way with the principal features of the work. The body of the bulletin is composed of excellent illustrated descriptions of the various trees to be found in New England. As a large number of these trees are also native to the various provinces of Canada, the bulletin, which is known as No. 69, will be of much interest to Canadian lumbermen and foresters.

### The Water Powers of Canada

The Commission of Conservation of Canada have recently issued an extremely interesting and valuable book upon the water-powers of Canada. The book contains the first inventory ever taken of the water-powers of Canada. It is profusely illustrated and well printed, in addition to being solidly bound. The investigations made by the Commission, which has extended over a period of two years, shows that there are 1,016,521 horse-power developed from water-power in Canada. Every phase of the subject from the laws governing the disposition of water-powers in the various provinces, to the actual physical data regarding each individual water-power concerning which information was obtainable, is treated in the report. In addition, there is a very full bibliography of 30 pages, and appendices giving, among other things, the text of the laws concerning the export of power and also of the treaty recently concluded with the United States regarding the establishment of an International Joint Commission.

### A Species of Conservation

In his evidence before the Tax Commission at Vancouver, Mr. Palmer, of the Chemainus Mills, discussed the by-products of lumber. When asked if he thought it possible to save these in the present condition of the market, he said he did not care to express an opinion, but that there was a wastage going on constantly, which he thought could be avoided. He said that in logging off lands it was impossible to avoid the destruction of large numbers of trees suitable for piling, railway ties and other purposes for which small trees can be used. If it were possible to save the smaller trees, they would, after a time, become saw logs, but it is not possible, for even when they escape destruction when the larger trees are felled those that do not fall furnish food for fire and in many instances they, the standing small trees, and too frequently the adjoining large timber, are destroyed. Mr. Palmer thought it would be well to remove the restriction from the exportation of such small stuff. He did not confine his suggestion to such of it as might be cut upon lands that were about to be logged off, but possibly a regulation could be devised that would meet the case in this respect, says the Victoria Colonist.

Mr. Palmer said that by removing this restriction a valuable asset would be saved and converted into money, the province would

be in receipt of some additional revenue, the danger of fire losses would be reduced, a profitable line of foreign commerce would be developed, and employment would be given to a good deal of additional labor.

### Severe Delivery Test for a Matcher

The December number of "Berlin Quality" contains as usual a splendid selection of articles of interest and value to the users of woodworking machinery. The excellent cover design of this issue shows the arrival of a Berlin Matcher at the plant of the Lady-smith Lumber Company, on Vancouver Island. This machine had to be loaded on two logs and dragged across country for 5 miles by 14 horses. This severe test demonstrated very thoroughly the advantage of using a solid cast-in-one-piece frame when machines are to be transported over rough country.

### Defiance Automatic Wood Bending Machine

The Defiance Machine Works, Defiance, Ohio, U.S.A., include among their numerous efficient products a patent 12-inch automatic wood bending machine, which has been designed to meet all their requirements for successful and economical bending of felloes for automobile, carriage and wagon wheels, wagon hounds, carriage bows, reaches and other similar classes of bent wood stock. This machine will bend the lightest felloes used for carriage wheels, up to heavy work required for farm wagon, truck and artillery wheels, bending hardwood as large as 5 inches thick, 12 inches in width, with adjustments to accommodate changes from 13½-inch

to 72-inch circles; also wagon hounds to any circle required and bows from 36 inch up to 44 inch wide. The form for this work is adjustable to bend any widths between the sizes specified. The capacity of the machine is sufficient to bend about 2500 felloes 1½ inch, or about 1,200 wagon hounds in 10 hours, and other classes of work in proportion. Timber to the amount of 12 inches in width, either in one piece, or pieces aggregating that amount, can be bent at one operation.

### Tools for Special Purposes

This is an age of specialization. Tools and machinery are demanded for a specific purpose—to do one thing well—to do it better and faster than with present practices and tools.

Recognizing this fact the manufacturers of the Shimer Cutter Heads began several years ago to prepare for each branch of work a special tool—a Cutter Head, embracing all the labor and time-saving features possible and made to work interchangeably with other tools.

These Cutter Heads while built on one general plan, differ in their special application, and embrace heads for making flooring, ceiling, siding, wainscoting, ship lap, O. G. batten, jointing, door and sash mouldings, etc., besides being adapted to the making of many specialties.

Messrs. Shimer & Sons claim that this interchangeable system has met with favor among mill men, especially as these special Cutter Heads are so low in price that a variety of them can be purchased for a comparatively small sum of money. Their large line of Matcher Heads are built to suit any pocket book and to meet conditions arising from day to day. They are made for the fast feed matcher taking stock at 200 feet per minute, as well as for all the machines between the fastest and the slowest.

Messrs. Shimer & Sons are also large manufacturers of the "Bedee Brand" of steel knives, for planing and surfacing lumber, which are proving popular with the mill men. It is claimed that the time lost in stoppages to sharpen up the old-fashioned soft slotted steel knives, will soon pay for the Bedee Knives, because they hold an edge from one to five days at a single sharpening, according to the class of lumber they are used upon.

Catalogues and prices for cutter heads and "Bedee Knives" may be had by addressing Samuel J. Shimer & Sons, Galt, Ontario.

## St. John River Cut Will Be Smaller

**Logging Operations Now in Full Progress—Season So Far a Favorable One—Millmen Expect Good Season's Trade**

Fredericton, N.B., Jan. 10.—Logging is almost entirely the order of the day along the St. John River valley, especially at the head waters. Although the cut is considerably under the average, the season so far has been a fairly favorable one for the lumbermen, as wages for men and teams have been lower than for a few years past, and the markets are showing signs of improvement. Millmen are taking a much more optimistic view of the situation than they did two months ago.

The cut of "bank logs" so called—that is logs cut by farmers along the river between Grand Falls and Fredericton, rafted in the spring when the river is clear of ice, and floated down the river to Springhill, five miles above Fredericton where they are offered for sale, unless contracted for earlier in the season and then made into larger rafts and towed by tugs to the mills at Fredericton and St. John—is likely to be up to the average, viz.: from 8,000,000 to 10,000,000 ft. B.M. The price offering at date of writing is for spruce \$13.00 for deal logs and \$9.00 to \$10.00 for battens, according to length. It is the custom in this section of the province, when scaling spruce logs to divide them into two classes, all logs of 11 inches in diameter at the top end, and 10 inch logs of 24 ft. in length and upwards being termed dead logs. The smaller diameters are known as battens, or batts.

There is practically nothing going on in the milling business along the St. John River, or through the province generally. A few mills on the American side of the river are sawing shingles and report a good demand for their output. A few small mills on the province side are sawing lath and report a steady market, netting about \$2.60 per M. on their shipments.

Large quantities of pulp wood are being moved at present, especially at points where the St. John River forms the boundary between the province and state of Maine, where it is hauled across the river, freighted by U. S. railways to U. S. mills and there manufactured. The price paid by local buyers at points of shipment is \$5.00 per cord for peeled spruce pulpwood, which is 50 cents more than was offering last season.

### The Cost of Selling Lumber

By Earl Bartholomew

The actual cost of selling lumber is somewhat hard to arrive at by wholesalers who are operating mills and conducting yards, for the reason that the expense is usually overlapped by the operating and selling departments. In order to make this more clear, our attention is called to the different classes of lumbermen:

- (1) The mills cutting from their own stumpage or buying logs and operating a yard in connection.
- (2) The wholesaler who buys lumber already manufactured and yards it like his neighboring mill man in the producing district.
- (3) That class of wholesalers who conduct wholesale yards in the consuming market.
- (4) Jobbers and consuming men who have no investment other than an organization for selling lumber.

Of course we can readily see that the entire expense of the jobber or commission man can be charged directly to the cost of selling lumber. All our club members are interested directly or indirectly in the manufacture, as well as the selling of lumber, so we will not take up the question of commission men or jobbers, but endeavor, if possible, to point out a few items of legitimate expense that should be charged to the account of selling by the first two classes mentioned. These items of selling expense we will take up as they would naturally be incurred by organizing a new yard, as follows:

- (1) The ordinary expense of maintaining an office would cost about the same whether the organization be large or small; these items being rent, heat, light, etc., including the salaries of the principal and representatives.
- (2) We will take it for granted there is a well stocked yard of lumber, and the next move should be along the lines of advertising in lumber trade journals, and includes postage, stationery, and cost of such assistance in the office in the preparation of advertising matter and advances to the trade.
- (3) The cost of commission must not be overlooked, as, especially in the beginning, every operator will depend in some measure upon the efforts of the jobber or commission man for the movement of at least a portion of his stock.
- (4) That class of expense which should be classed under the head of travelling, by the principal or representatives.

Of the four classes of expense your attention is called to that of advertising and travelling, or personal solicitation, as a method to reduce the high cost of selling lumber. There is no question but that

this cost is reduced by judicious advertising in lumber trade journals; results may not be had to-day, but the effect is far reaching, and without this aid special efforts must be made by personal solicitation, and through the mails, to offset this advantage.

While the cost of personally calling on the consuming trade is the most expensive method of selling lumber, this is largely reduced by the information obtained as to the customer's requirements, and the results of personal visits to the trade should mean an exchange of ideas between buyer and seller which is always mutually beneficial, for it is not always the volume of business done but the amount of lumber carefully handled that is usually the most profitable and satisfactory.

Again, when active canvass is continually made for business, the seller will become better informed as to the changing market conditions.

The sales department being in touch with trade conditions, with the co-operation of the operating department, will enable the mill to cut stock for which there is an active demand and prevent carrying charges of long stocks that price only will move. What your customer is using to-day he may substitute altogether with some other wood, or perhaps dispense with wood for steel, to-morrow, thereby leaving you to search for orders elsewhere to move stock cut ostensibly for your customer.

Another feature of the sales end is, there is a better profit in moving stock from the yards as soon as it is ready for the market; while often there is a speculative value in holding stock, it is generally conceded that lumber turned over two or three times a year, as soon as shipping dry, at a nominal profit, is better for both mill and yard, for it economizes yard space and enables mill to cut stock for which there is an active demand.

Ordinarily, as a selling basis, the cost of selling lumber on commission paid to salesmen is usually three per cent. on the net amount, after freight has been deducted, but authorities are of the opinion that the actual cost of hardwood lumber sales, distributed over the country to consumers by travelling men, through the results of advertising, etc., in some cases may exceed this.

### Saw Mill Ideas

By E. L. Mason

I would like to know why so many mills are short of power. Ours is an example. This mill was built for a fast mill—concrete building, electric drive, seemingly no expense spared to build a good, substantial and fast-cutting mill. Yet to save a little money—I can think of no other reason—they put in an engine at least 200-h.p. too small. Now they have put in another engine of 400-h.p. to help out the original engine.

Our saws sing alright now, and no time lost for anything. We used to have to stop one side while steam was coming up, after being pulled down by fast sawing or a run of large logs, for an engine working to the limit of its power consumes lots of steam; the same boilers are now running the two engines, without any trouble for steam.

I recently had a crippled saw that was some puzzle to me. It was damaged in a wreck. There was about 12 feet where the back was  $\frac{3}{8}$ -in. in 5 feet—too much crown. I had never tried to see how much could be put in with a roller, but always supposed that all the back that could be put in a saw could be taken out again. I have, however, tensioned this place to a 40-ft. gage, and let it out again on the tooth edge, eight different times, yet it has  $\frac{3}{16}$ -in. crown in 5 feet, and there it stays in spite of all the rolling I can do. Of course, I drew out the balance of the back enough so that it runs alright, stands plenty of feed and makes nice lumber, but it oscillates on the wheels  $\frac{1}{8}$ -in. Now, what puzzles me is why this piece should be so hard to straighten. It is only 13 inches wide and is good steel to work.

When the bearings for the rolls on the resaw wear out and are put in new, be sure and see that the rolls line up right with the saw, also that they stand exactly in line up and down with the saw. If they do not, the saw will make lumber thick on one edge and thin on the other, and then there is trouble that is blamed on the saws. When the rolls wear 1-in. smaller at the bottom than at the top, they had better be replaced with new ones. I have seen them run worse than this, but it does not pay any more than it does to keep a poor-working offset on a carriage. It is well to look at the tapered wear on the rolls when you put in new bearings, or the rolls may not stand just as they did with the old bearings.

One of the most common causes for poor lumber, that is usually blamed to the resaw, is the big bands making "bullhead" lumber. A saw making poor lines is not helped any by lining out of the log, as some filers do, as lining out will make "bullheads" about as quickly as anything you can do; and this kind of lumber is not improved by going through a resaw, so it is better to not lay poorly-sawed lumber to the resaw until you are sure that the lumber being put through is straight to start with. A resaw cannot be expected to straighten out crooked lumber.—The Woodworker.

# WANTED & FOR SALE DEPARTMENT

## PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

## WANTED—LUMBER, ETC.

WANTED—Kindly give best cash price for three or four cars dry cedar posts, 4 to 6 inches top end. Box 195, Jordan, Ont.

WANTED—5 x 5 White Maple, second growth, dry, 5 to 10 years old, for bowling pins. Address, M. J. Bernhard, 712 to 720 Jefferson Street, Buffalo, N. Y. 1-4

Two-inch Soft Elm wanted, immediately, several cars, dry. State quality and prices. Great Lakes Lumber Company, Limited, Owen Sound, Ont. 1-4

## Saw Logs Wanted

Red and White Pine, Hemlock and Spruce. Write in particulars of what you have. Reid Bros., Bothwell, Ont. 2-7

## Basswood Wanted

WANTED—inch No. 2 common and mill culls, winter cut Basswood. Apply Firstbrook Box Company, Limited, King street east, Toronto. 22-25

## White Pine Wanted

Wanted to buy in small or large quantities White Pine, 1-in., 1½-in., 2-in., also shorts for factory work. Apply Box 404, Canada Lumberman, Toronto, Ont. 2-2

## White Pine Wanted

3 ft. x 6-in-7-in. 18 ft. Tank Stock, also Quarter Cut White Pine Pump Squares. Ontario Wind Engine & Pump Co., Ltd. Toronto, Ont.

## Wanted

two carloads 4-inch firsts and seconds, Hard Maple, dry, 6 inches and up wide, 10 ft. and up long, for immediate shipment. Quote price and point of shipment to Box 360, Canada Lumberman, Toronto, Ont. 22-1f

## Lumber Wanted

Large quantities of Soft Elm Lumber, 1-in. and grades No. 1 common and better. Especially attractive prices.

J. S. FINDLAY,

2-7 Owen Sound, Ont.

## Hardwood Lumber Wanted

We are open to buy 2,000,000 feet Hard Maple, Soft Maple, Soft Elm, Rock Elm, Beech, Birch, Basswood, Ash and Chestnut cut to our instructions, delivery 1912; inspection at mill. Let us have your lists. Apply Box 408, Canada Lumberman, Toronto, Ont. 2-2

## Wanted Box Lumber

Large consumer of No. 1 and No. 2 White Pine Box Lumber, desires to negotiate with responsible shippers, regarding stock for water delivery next season. Give shipping point, state quantity 4-4 and 5-4 can furnish with lowest quotations and other particulars. Address, Box 374, Canada Lumberman, Toronto, Ont. 23-2

## Birch Wanted

We want to buy Birch in all thicknesses. Log run or on grades. Will contract for winter's cut. National Lumber Company, Buffalo, N. Y. 23-2

## Lumber Wanted

Will contract with a few hardwood mills for their entire cuts, 1912, including culls. Highest prices paid, and quick shipment. Also open for dry stock of all kinds. Also Spruce and Hemlock. Apply to Box 414, Canada Lumberman, Toronto. 2-5

## Maple and Rock Elm Wanted

Wanted—Up to 120,000 feet 1-in. and 1½ in. hard maple 6 in. up wide, 10 ft. up long; also 20,000 feet 1-in. and 1½-in. rock elm 6-in. up wide, 10 ft. up long; quote price for 1sts and 2nds and also No. 1 Common grades in each case and name point of shipment to Box 382, Canada Lumberman, Toronto, Ont. 24-1f

# Hardwood Wanted

3,000,000 feet Hard Maple, Soft Elm, Rock Elm, Beech, Birch, Basswood, Ash, Oak, and Soft Maple, for delivery, shipping dry during 1912. Sawn to our sizes. State what you have to offer and lowest prices for spot cash. Inspection at mill. Apply Manufacturer, Box 401, Canada Lumberman, Toronto, Ont. 1-8

## FOR SALE—LUMBER, ETC.

## For Sale at Greatly Reduced Prices

400,000 M ft. 1 x 4 and up by 6/16 ft. No. 2 Hemlock.

75,000 M ft. 1 x 8 and 10 x 6/16 No. 2 Hemlock.

25,000 M ft. 2 x 4 x 6/16 No. 2 Hemlock.

25,000 M ft. 2 x 6 x 6/16 No. 2 Hemlock.

## Canada Lumberman and Woodworker

Toronto

Canada

## For Sale

1-in., 1½-in., 1½-in. and 2-in. mill cull White Pine in strips and sidings. Fred T. Smith, Board of Trade Building, Montreal. 1-1f

## For Sale

About 1,500 feet 2-inch beech, 1,200 feet of 1-inch, 1,500 feet of 1½-in., 5,000 feet 1-in. maple; 6,000 feet 1-in. hickory, 2,000 ft. 1-in. oak, all log run. John Richie, Allan's Mills, Ont. 2-3

## Shingles

500,000 M. pieces Rathbun's XX-18-in. Cedar Shingles. To introduce this shingle to the trade, we are offering them for one-half their value. \$1.00 per M. pieces F.O.B. cars Deseronto. The Rathbun Company, Deseronto, Ont. 1-4

## 12 in. x 12 in. For Sale

300,000 feet B.M. of 12-in. x 12-in. short leaf yellow pine timbers 18 ft. to 40 ft., average 30 feet. Can ship immediately.

24-3 JAMES SHEPPARD & SON, Sorel, Que.

## Hardwood For Sale

We are prepared to cut under contract:— 250 M. to 500 M. feet Hard Maple. 100 M. to 200 M. feet Basswood. Also some Black Ash, Birch, Soft Elm. Correspondence invited. The Pearce Company, Limited, Marmora, Ont. 22-1f

## For Sale

The following Special Stock:— 1,000,000 ft. Scant 2-in. Spruce Random. 300,000 ft. 1-in. Spruce Mill Culls. 50,000 ft. 6/4 and 8/4 White Pine Mill Culls. 100,000 ft. 1-in. 6 to 9 ft. White Pine Shorts. 100,000 ft. 1-in. Fourth Quality or Box White Pine. All dry and can be shipped promptly by rail. THE A. SHERMAN LUMBER CO., Potsdam, N. Y. also 50 Church St., New York City.

## FOR SALE—MACHINERY, ETC.

## For Sale

Good boiler, 72 inches by 14 feet, 72 4-in. tubes, 75 h.p. engine and 100 light dynamo. All in good condition and ready for immediate delivery. Will accept lumber in exchange. Apply to Box 400, Canada Lumberman, Toronto, Ont. 1-4

## For Sale

One fifty horse power tubular boiler complete with front, grate bars, injector and smoke stack, and one thirty-five horse power engine, together with steam pipes and heater, for \$250, f.o.b. cars. For particulars apply to C. H. Sheppard, Waubesa, Ont. 23-2

## For Sale

One Gang Circular Sawing Machine (Kendall patent) good as new; run only 18 months. This machine carries nine 32-inch saws, takes from 4 to 10-inch cants, can be set to cut one to three inch stock. Reason for selling, cut out. For price, write Jas R. Gillies, Arnprior, Ont. 24-5

## Machinery For Sale

Carver, 4 spindle, Rohlman. Cut-off saw, railway, wood frame. Dovetailer, Boults. Engines and boilers, various sizes. Floorer, 9-in. Berlin. Jointer, chair seat, Jenkins. Jointer, 16-in. White. Moulder, 6-in. Houston. Mortiser, Smith. Mortiser, Bit. Planers, 24-in. single belted. Sander, double 24-in. Perry. Sander, three drum 42-in. Boardman. Sander, three drum 42-in. Columbia. Saw Gummer, Rogers. Saw-mill, band, 63-in. wheel. Saw and dado machine, Williamsport. Variety Lathe, Pringle & Brodie.

O. L. PACKARD MACHINERY CO., Milwaukee, Wis.

## Machinery For Sale

A Waterous No. 4 Band Saw Mill, with Carriage Saws, Live Rolls, and complete Filing Room equipment, also several Good Woodworking Machines, in splendid condition.

J. S. FINDLAY,

2-TF Owen Sound, Ont.

## WANTED—MACHINERY, ETC.

WANTED—By small mill cutting hardwood, power feed edger, iron or wood frame, with 2 or 3 adjustable saws, to cut stock up to 3 inches thick. Must be cheap. Craik Bros., Crampton, Ont. 2-4

## Alligator Wanted

Wanted an alligator boat, in good condition. Reply, giving condition, size, age, equipment, price and situation. Box 405, Canada Lumberman, Toronto, Ont. 2-5

WANTED—Two boilers, not less than 100 pounds steam, 66-in. x 14 ft. Filing room outfit for 12-in. double cutting band saws. One good log jack and chain. Give full particulars in first letter. Box 412, Canada Lumberman, Toronto, Ont.

## WANTED—EMPLOYMENT

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

Wanted a position as gang-filer; eighteen years experience. Address Geo. L. Nichols, c/o Canada Lumberman, Toronto, Ont. 2-4

First-class band and band resaw filer experienced in box factory and saw mills. References. Box 383, Canada Lumberman, Toronto, Ont. 24-3

Band Saw Filer wants position for coming season. Single or double cut. Twenty years experience. Address Box 413 Canada Lumberman, Toronto, Ont. 2-4

Saw Filer wants position in saw mill or woodworking plant. Capable of keeping band and circular saw in perfect condition. Apply Box 403, Canada Lumberman, Toronto, Ont. 2-4

Wanted by lumber inspector, position by the year. Fifteen years experience. Ten years with present firm; reference furnished. Car or boat shipping. Box 409 Canada Lumberman, Toronto, Ont. 2-3

WANTED—Position as bookkeeper with lumber firm in Ontario. Twelve years' experience, mostly as office manager; age 34 years. Acquainted thoroughly with all departments of lumber office. Best of references furnished on application. Apply Box 399, Canada Lumberman, Toronto, Ont. 1-8

Scotchman, just arrived in Canada, age 27, desires position of trust with a lumber company, wholesalers or export millmen preferred. He has practical, commercial and travelling experience. Can influence good business with United Kingdom. Replies solicited in first instance to No. 200 Canada Lumberman, B34 Board of Trade, Montreal. 2-2

## WANTED—EMPLOYEES

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

Young man to take charge of office in town on Georgian Bay. One with some experience in lumber trade preferred. State age, salary expected and references. Box 397, Canada Lumberman, Toronto, Ont. 1-2

WANTED—Hardwood lumber buyer; must be experienced and capable of grading in accordance with National Hardwood Rules. We want a high-class man and will pay accordingly. Box 380, Canada Lumberman, Toronto, Ont. 24-3

Millmen wanted, millwrights, edgermen, trimmermen, engineer, band saw filer. Lath mill men and lumber pilers. Mill will start as soon as ice clears in spring. Apply giving experience, etc., To Dymont Mickle Lumber Company, Whitney, Ont. 2-3

## BUSINESS OPPORTUNITIES

### Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. 1-2

### Sales Agents Wanted

Large British firm with plants in England, Bohemia and France manufacturing Carborundum and Electrite goods and high class grinding machinery wants to secure either first class salesmen or firms with established trade connections to represent them in Canada. Apply Box 394, Canada Lumberman, Toronto, Ont. 1-2

### For Sale

Up-to-date Circular Saw Mill, going concern, 15,000 to 20,000 capacity; In good shape. House and stables, tools and utensils of all kinds, 300 acres of bush land, railroad connection. Much timber can be bought. This is worth looking into. Will be sold cheap. Write Jones Brothers, Katrine Station, Ont. 1-2

## Canadian Timber Limits

### E. STEWART (Forest Engineer)

Dealer in Timber Limits, Ontario and Western farm lands and town property. Excellent investments now open. Correspondence invited. 84 King Street East, Toronto. Phone Main 5609.

### For Sale

Established Lumber Business, with first-class mill, now running full time. Timber limits with 20 to 30 million feet of standing pine timber conveniently located, and all merchandise, etc. Price \$55,000. This is worthy of investigation. Address Box 332, Canada Lumberman, Toronto, Ont. 19-22-t.f.

### For Sale

170 ft. 1 in. good basswood short, 2 to 5 ft.  
11 M. ft. 1 1/4 in. good basswood short, 2 to 5 feet.  
14 M. ft. 2 in. good basswood short, 2 to 5 feet.  
50 M. ft. 1 in. M. C. Ash.  
50 M. ft. 2 in. M. C. Ash.  
GEO. C. GOODFELLOW,  
Montreal, Que.

### For Sale

Sawmill and Shingle Mill in active operation and thoroughly equipped with A1 up-to-date machinery in first class condition. Timber on all sides. Exceptional opportunity; \$1,600 cash, \$1,600 in 6, 12, 15 and 18 months. Can secure eighty acre cut of virgin timber, thirty yards from mill if desired. Write D. McNair & Son, Whitewood Grove P. O., Ont. 23-2

### For Sale

Mill and Plant situated on Bay Lake of Montreal River and within the town limit of Town of Latchford on T. & N. O. Ry. Plant consists of one Boiler, 60 in. diam. by 14 ft. long, full flush front and rated at 70 h.p. Right Hand Engine, 12 in. x 16 in., estimated 64 h.p.

Three Moreau Machine Pulpwood Barkers and Pullup and all saws, shafting, belts, etc., including extras.

Siding of T. & N. O. Railway runs into mill yard; good storing point for logs. With very little extra cost, a circular saw and carriage could be installed as the power is sufficient. This plant has been in use about 10 months only and is in good condition. An excellent bargain for the right parties. Write or communicate with C. & H. D. Gamble, 28 Scott street, Toronto, Solicitors for Owners. 2-7

## MISCELLANEOUS

### For Sale

About 48 acres of standing timber, suitable for lumber and cedar poles. S. A. Price, Burnhamthorpe, Ont. 2-3

Correspondence solicited  
Satisfaction guaranteed

A. T. FRAMPTON, Victoria, B. C.

## Why Bandsaws Break

One of the most fruitful sources of annoyance in the average wood-working plant is undoubtedly the bandsaw; especially is this the case when light machines and small saws are used. The heavier variety usually have more care bestowed on them from the first, i.e., choosing a site and fixing them securely down on a solid bed, so they naturally run much steadier and cause less trouble.

Their smaller brethren, however, are often less fortunate in this respect. They are usually found on an upper floor, and that said floor is often a very shaky one, while the only fixing that is possible is a short wood screw in each corner of base. Is it, then, any wonder that bandsaws do break more or less frequently under such trying conditions? I often wonder how such a thin band of steel travels so quickly on an unsteady machine with badly-covered wheels. It certainly speaks well for the quality and temper of the saws, and very little for the management of any shop to allow such conditions to exist.

Bandsaws are like all other high-speed machines. Rigidity must be obtained and maintained somehow or the other. We cannot always have them on the ground floor, unfortunately. But they can usually be shored up in some way to increase their ability. It is a simple matter to strut them from overhead, or shore them from the floor; it matters little how it is done, so long as it is effective and durable.

The wheels should also receive attention from time to time, to ensure steady running. It is only a small matter to true the wheels up and set them in line, yet it makes all the difference between good and bad work. It is a great mistake to put too much strain on narrow saws. The less you can do with the better will it be for the machine and the saws. Make your machines as steady as possible; have the wheels true. Don't strain the saws, but have them sharp and finely set. Then you can do more work and do it better, and not be troubled with saws breaking continually or running off the wheels or out the cut.

Sawyer.

## Some Rules Worth Noting

Never attempt to caulk a leaky seam in a boiler under steam pressure; the jar caused by the hammer blows cause a rupture of the seam. This caution applies also to steam-pipes and valve casings. A round-nosed tool should be used in caulking boilers.

Before breaking any steam-pipe joints to make repairs or to renew gaskets, etc., the dead section should be well drained.

Workmen have been scalded when breaking joints, due to some pressure still remaining in the line after the main valves were closed.

In case the feed-pipe of a boiler gives out, or water cannot be supplied to a boiler for any reason, the boiler should be shut down at once and the fires drawn.

Watch safety-valves carefully, to be sure that they do not corrode fast to their seats.

The pipe connecting the steam-gauge should be cleaned out at least once a month by blowing steam through it. When the gauge is off the hole in the nipple should be perfectly clear.

When observing the glass water-gauge while the boiler is working, note particularly whether the water in the glass is stationary or not. If the water level does not fluctuate it is an infallible sign that the gauge is out of order. Test the gauge and water column immediately, and if draining them fails to clear, the boiler should be shut down until the apparatus for indicating the water level has been repaired.

Where there are two or more boilers on one line, those not in operation should be shut off from the header.

A small leak in a boiler may be detected by a white wedge-shaped mark on rivets or plates. In caulking, chalk or otherwise mark all the leaks first, as the hammer blows may destroy the faint indications due to the leak.

Never lose an opportunity to compare the steam-gauge with the safety-valve when the latter blows off. If they do not agree, ascertain which is incorrect.

Always bear in mind to clean out boiler thoroughly after doing any hammering on it, as scale may have been dislodged and dropped down on the fire sheet. Bags and serious ruptures have resulted from neglect of this precaution.

In winter, if the boiler is exposed to cold, close the valves between the boiler and the water-gauge glass when the boiler is shut down for the night, and let the water run out of the glass. Also leave all drain cocks on pipes, etc., open.—Timber Trades Journal.

## Guards Should Be Used, Always

On the subject of accidents much has been and will be written, for they will occur. Some of the worst accidents happen in conjunction with machines not usually considered dangerous.

Some time ago a man was using a small shop rip saw, and, although the machine was equipped with a guard, it was pushed up to one side and not in use. In ripping a small wedge, 7/8 x 7/8 in., about 3 in. long, off the edge of a board, the saw caught the wedge and threw it straight back and up, squarely into the

operator's eye. The butt end struck him fair in the eye and he fell back on the floor unconscious, with his eye gone.

The guard, had it been in place, would have caught the wedge and saved the man's eye. Saw guards, jointer guards and shaper guards should be in all shops and in constant use, not hanging on a nail on the wall, where we frequently see them. Unfortunately, many operators seem to dislike to use them, and the result is sometimes serious.

Hampton,  
in the "Wood-Worker."

## Collars of Saw Spindles Out of True

If the collars of a saw spindle are only slightly out of true, it is multiplied considerably in a saw of large diameter. A seamy saw spindle with a bit of metal torn up is enough to throw a saw out, or if packing be used up or uneven it will have the same result. Saws are sometimes blamed for cutting untrue when the fault lies with the collars or pins. The side of the saw nearest the wood should be tried with a straight-edge, and should it be found to bulge in the centre it will probably arise from the saw collar being out of truth or improperly concaved. If the collar attached to the saw spindle—that is the one nearest the wood—is perfectly flat, have it removed and slightly concaved, when the bulge in the saw plate will probably disappear. Use collars of ample diameter.

## For Immediate Shipment

1250 tons prime 56 lbs. relaying rails with fastenings.

25 Steel Flat Cars 5 to 7 tons capacity.

Full particulars on application.

**SESSENWEIN BROS.**

## WE SPECIALIZE IN Saw Mill Repair Work

Our machine shop is equipped with best and most up-to-date machinery for Saw Mill work of all kinds and we can turn out your work promptly and with satisfaction.

Let us send you estimates on your spring work.

**Maass Bros.**  
Irving Ave., Ottawa, Ont.

# Review of Current Trade Conditions

## Ontario

The lumber trade in Ontario is naturally quiet at this time of year, on account of the lack of building operations and the fact that stock-taking is the chief occupation of the retailers throughout the country. Nevertheless, reports indicate that there is a fair amount of trade in progress and that, in spite of the severe weather, retailers are receiving an encouraging number of enquiries. In western Ontario reports from some of the more important centres are to the effect that enquiries are more numerous than they have been at this time of year, for some years past. Several of the more important cities are expecting excellent business this year. Hamilton, for instance, is looking for an active demand. Brantford also, and Welland, are expecting that there will be a better trade than ever before.

The dependence of eastern Canada upon conditions in the west is a fact which must always be kept in mind and there are some in the west who think it is wise at present to sound a slight note of warning, on account of the failure of many of the western farmers to get the wheat in from a large amount of their farms. This wheat in many cases may be of little or no value, and in addition, it has prevented the farmers from preparing the land for Spring sowing. Although the situation is not one to cause immediate anxiety it should be kept carefully in mind. Reports are also made to the effect that loan companies in the west have been obliged to come to the assistance of a number of farmers who have been unable to make their interest payments. Then again there is the effect of the Presidential election to be kept in mind this year, so that although alarm is not justified there is reason for a certain amount of caution, more than in former years. When one takes into consideration the unprecedented expansion which is in progress in Canada and the extensive immigration which is certain to continue, it is almost reasonable to expect that we could without difficulty minimize, almost to zero, the effects of such adverse influences as those referred to above. They are given simply as a mild note of caution to the Ontario trade to remind them of their dependence in large measure upon western conditions.

## Eastern Canada

The logging season in New Brunswick has been a favorable one so far, and it is expected that similar conditions will continue. Wages and the cost of teams have been lower than they were for a couple of years previous. In spite of this however, it is possible, on account of the unsatisfactory conditions which have prevailed in the lumber markets for some time, that the cut in the woods will be less than usual. Bank logs on the St. John will be about as usual, viz.: from 8,000,000 to 10,000,000 ft., B.M. Deal logs at present are bringing \$13 and battens from \$9 to \$10 according to their length. The milling business along the St. John is practically at a standstill. In Quebec, trade is quiet on account of the winter weather. Stock-taking also is general and as a result the retailers are not buying much. The opinion of the trade in general is that during 1912 business will be very good. Building prospects and the general prosperity of the country all point in this direction. The pulp and paper situation shows no important change. An unusually busy season is expected this year on account of the Presidential election in the United States which always results in an enormous extra consumption of paper.

The spruce market at Boston is firm. Stocks at mills are reported to be only moderate and manufacturers are said to be holding for full prices. Lumber operations in the State of Maine were checked by the light snow fall until the first week of January. Boston retailers are not over-stocked with frames. There has been activity in building and stocks have been considerably reduced. Retailers have not been ordering much stock for immediate delivery, although fair orders for spring delivery have been made. A better demand is expected, now that the stock-taking season is about over. Frames 9-in. and under are being held at \$25. A firm market is reported for random, with offerings light. Spruce boards are not very plentiful. Dry stock is scarce. Hemlock boards continue firm at Boston, manufacturers expecting to secure their price by waiting. Eastern clipped boards are firm at \$20, and a further advance is talked of in some quarters. Shingles are firm and in good demand, cedar extras selling as high as \$3.65, although quotations are from \$3.50 to \$3.60. Clears are very firm at \$3.20 to 13.30. The demand for lath is quiet. Some dealers are offering 1½ inch at \$4.15. Others will sell at \$4. For 1½-in., \$3.50 is asked. There is not an active inquiry for hardwood lumber, but prices as a rule are steady, with the exception of quartered oak.

The arrivals of eastern spruce at New York are light. Prices are unchanged, although there is strong competition for any large

business which offers. A slight improvement is noted in the demand for hemlock, at New York, on account of fair activity in the building trade.

## Great Britain

The general activity which has prevailed in London for some time past and the share which the railway companies have taken in it, leads to a reasonable expectation that there will be a good increase in the timber requirements of the railways during 1912. Such an incentive to trade would be gladly welcomed in London and would go a long way towards making good for the dull trade in other directions. Deliveries at London docks for the week ending December 23rd amounted to 4,680 standards as compared with 3,560 during the corresponding week of 1910.

At Liverpool, the timber trade was practically in a state of suspension during the holiday season, the expectation being at that time that the quietness would continue into the New Year until stock-taking had been completed. The increased intensity of the labor troubles in the mining and cotton industries was having a very depressing effect upon trade, and widespread apprehension was at that time experienced regarding the immediate future of many of the important industries of the country. Long continued labor troubles of this class would be certain to cause a great loss to the carrying trade and the consequent effect upon the timber business would be disastrous.

Very little business was reported in spruce deals "to arrive" from St. John, N. B. One steamer from St. John had a few parcels of deals which were sold by private arrangement. The stock in first hands at Liverpool is believed to be materially smaller than that of the year previous, especially in deals, of which the higher qualities are particularly scarce. Exact figures are not yet available but they will be ready for publication shortly. Liverpool importers are convinced that the prices for next season's shipments from Montreal will be higher, as Ottawa producers are getting better prices for their output and an advance in freight rates is more than likely. The wagon oak trade at Liverpool has been quiet on account of higher prices of material. During the past year or two, prices of oak, spruce and red deals have increased, as well as the prices of the necessary metal for wagon building. The cost of labor has also advanced and accordingly the prices of wagons have risen considerably. The result has been a falling-off in the demand for railway wagons, in the hope that lower prices would appear later on. The indications, however, are that instead of lower prices higher ones are to be expected. Accordingly a few good sized orders for new wagons have recently been placed. It is believed that these are the forerunners of future business. Importers of oak are therefore feeling confident of the future and are inclined to make contracts in order to protect their own interests.

Manchester trade has recently been paralyzed for the time being by the renewal of the cotton trade strikes. Very little business is reported in the timber trade as this is practically the slackest season of the year. It is generally believed that the year 1912 will see a very heavy import of timber to Manchester, especially in spruce. Against this belief, one has to keep in mind the high freight rates. It is believed, however, that much of this advance is due to manipulations of capital in the shipping world. Industries in general at Manchester are in a very healthy condition and if strikes and lock-outs can be avoided, 1912 ought to be an active and profitable year. Congestion in Manchester docks still continues as the railway companies have still been unable to clear up their outstanding orders.

## United States

The severe weather which has been prevalent in most of the Northern States during the past week or two has practically put an end to building operations and local demand for lumber has declined materially. Until the cold weather set in the demand had been better than usual for so late in the winter. This condition applies very strongly to Chicago, where the indications are that the spring demand will open early, with a free movement of stocks. The receipts of lumber at Chicago, for the week ending December 30, were 44,827,000 feet, against 23,707,000 feet during the corresponding week of 1910. The total receipts for the year amounted to 2,134,567,000 feet, a decrease of 384,790,000 feet from the receipts of 1910. The shipments at Chicago, for the week ending December 30, were 17,415,000 feet, against 11,892,000 feet for the corresponding week of 1910. The total shipments for the year were 803,923,000 feet, a decrease of 159,853,000 feet from the shipments of 1910.

Chicago:—The trade in northern pine shows no important activity, but there is a generally expectant feeling that activity will soon commence. The severe weather and the approaching convention season will probably check business for the time being. Good prices

E. C. BARRE, Ass't. Mgr.

are being secured, however, and wholesalers believe that they will advance as soon as trade becomes active. There is a moderate movement of hardwoods, although no considerable revival has occurred since the holidays. Chicago factories have a fair amount of work on hand and are more inclined to purchase for their future needs. A few of the consumers, such as agricultural implement and car building companies are watching the market closely, with a view to picking up their requirements for the year. The shortage in plain oak is making itself continually more noticeable. There is only a moderate demand for quartered white oak, but quartered red has been somewhat more active. Birch and maple are moving fairly well. The upper grades of basswood are quiet and there is a good demand for the common lines. The outlook for the hemlock trade is considered to be brighter than it was a year ago. A good business is expected in the spring. A few retail dealers are placing orders for early delivery. It is expected that the in-put this winter will not be as great as last winter and that manufacturers will therefore be in a better position to ask for higher prices. The yard trade in southern pine is quiet but an active trade is looked for in the spring. It is expected that the demand will be larger all along the line. Stocks at the mills are reported to be much lighter and assortments broken, on account of the curtailment of manufacturing and the demand for railroad material and timbers. The most important feature of the market is the strong demand for car material. The demand for shingles has almost disappeared and prices are unchanged. Lath are strong. The cooperage market is generally in an easy condition, with little change expected.

**Buffalo:**—The trade in white pine is well maintained. Just before the conclusion of 1911, heavy shipments were made from white pine yards, on orders which were to be filled for 1911 business. It is expected that this condition will continue into the near future. The hardwood trade is rather quiet, on account of the stock-taking season, but is expected to revive shortly. A fair volume of southern stock is being received and prices of most goods are holding firm. Some are even a little stronger, particularly quartered oak. The demand for hemlock has been less than usual but an improvement is soon expected. Stocks are not large and prices are firm. No advance, however, is expected, as such an event would turn the trade into other channels. On the other hand it seems equally certain that no weakening of prices is to be expected. Building operations are fairly active for this time of year. The holiday season has had rather a prolonged effect upon the southern pine trade but the outlook for better business is fairly bright. Mill shipments are coming forward more readily. Prices are firm and are expected to continue so during the winter months. Red cedar shingles are quiet, there being little demand and retailers having fairly extensive stocks. Prices are low and not very firm. There is a little better enquiry for stars than for clears.

**North Tonawanda:**—The trade in white pine is of a rather spasmodic nature, on account of the effect of the recent holidays. Stock-taking has shown some of the dealers that they have better stocks in certain lines than was expected. It is believed, however, that considerable quantities of lumber will be brought into Canada during the winter, as an active demand is expected. Manufacturers have been in the market during the last few weeks looking into the prospects for the sale of next season's cut.

**Saginaw and Bay City:**—A good demand has prevailed of late for low grade box lumber, trade having improved considerably during the last month. The better grades of white pine are moving moderately and factories are operating steadily. Buyers are expected to be on the search for stocks in the near future. Much of their next season's material will be secured in Northern Michigan but the bulk of it will come from Canada. Dealers are looking for an active trade in the spring. Large quantities of lumber, especially of the low grades are coming in by rail from interior mills.

### Changes in Flooring

It is an open question whether the great change in sentiment that has taken place in regard to flooring, really means a general permanency of the present popular hardwood floor, or whether it will soon lead to the same wide diversity in the use of hardwoods for flooring as is to-day used in furniture and cabinet and general mill work. To understand more fully the meaning of the great change in flooring, we must take into consideration that it is really a change from carpets to rugs, or rugs and bare floors. Flooring material was not given much serious consideration so long as most floors were covered entirely with carpets, but with the passing of the old carpets and the bringing into view the material of the floor in modern home life, there has been born a desire for that which is pleasing in appearance as well as substantial and durable in flooring material.

Of the progress of maple and oak replacing pine floors, the trade is pretty well informed, but now the question is, does this end the change? Will it be simply a matter of further enlargement of

the use of these well-known hardwoods, or will we soon be using every kind of hardwood in floor-making? Some beautiful effects can be had in woods very little known in the flooring business proper, and there is a chance that we may soon have the wide variety of flooring that we have in furniture and finish. Already beech has made itself known, and birch is beginning to attract considerable attention, while gum, as is well known, has made its way into almost everything, including flooring. Many floors, of course, have a combination of woods—that is, of cherry, walnut, mahogany, various woods of specific color being used for stripe and border effects along with the inner field work of oak, maple and beech. Of course, this practice will extend further, but the most important thing is the possible extension of every and any hardwood that will present a pleasing appearance and give a reasonable amount of durable service. In short, there may be in almost any community where hardwoods grow, material that would enable local mill men to put up and market flooring that will furnish all the points of beauty and durability desired.

There is room for a great deal in the hardwood flooring business aside from the two well-known lines of maple and oak, for, because of the sanitary advantages, as well as appearance, the hardwood flooring idea is likely to stay with us through this generation at least.

## Quebec Expects Good Trade in 1912

### Conditions Point to Unusually Good Demand for Lumber, Pulp and Paper—Presidential Election a Factor

**Montreal, Jan. 10.**—With winter conditions prevailing, there is little to report in the way of business. Trade has been very quiet, although some retailers state that they have done fairly well, taking into consideration the season. Building operations recently have been confined to narrow limits, and whatever retail orders have come to hand they have been of a hand-to-mouth character. Many wholesalers and retailers have been stock-taking, and of course have not been anxious, under these circumstances, to add to their stocks. Another factor which has operated against business has been the closing down for a week of practically all the mills, owing to the holidays.

A general feeling of optimism prevails as to the present year. Reports indicate that the building trade is likely to be very active, and some lumbermen look forward to even a better year than 1911, which was a period of unusual prosperity. In this connection it may be stated that the manufacturers of doors, sashes, &c., are very busy on good orders.

There has not been any great change in the pulp and paper situation. In neither commodity are there any surplus stocks in Canada. The new mills have all the business they can handle for some time to come, and while the spot demand for ground wood for export to the United States is small, the contracts are taking all the production of Canadian mills. It is reported that the water power in Scandinavia is 20 to 30 per cent. less than normal in some parts, and although in one section the streams are full, they are sinking, and it is expected that the cold weather will reduce the river levels during the winter. The loss in water power has caused almost a famine in ground wood in Europe. A press despatch from Germany states that by February 1st the German mills will be unable to supply the press in sufficient quantities for that country, and the deficiency will have to be imported. The price of ground wood is 20 per cent. higher in Europe than it was last summer.

Chemical wood pulps have advanced materially in Europe, and to a greater extent in the United States and Canada. There will probably be a considerable shortage in sulphite this winter.

The indications point to a very busy year in pulp and paper during 1912. No one unacquainted with the facts can realize the large increase in consumption of news paper which results from a presidential election in the United States.

Some activity among the newspapers of the United States over the pulp and paper tariff is now in evidence. On this subject a well-known authority states: "They have attempted to force President Taft to order the removal of the duties from pulp and paper going into the United States from Norway, Sweden, Germany and Austria-Hungary, under section 2 of the tariff. This section was made effective principally to prevent Canada from further restricting the export of her pulp wood to the United States. Nearly one million cords per year are feeding the pulp and paper mills of that country, without which they could not exist. This latter feature of the tariff matter is entirely evaded in the discussion at Washington and in the press of the United States; but it is looked upon in Canada as the crux of the situation. Canada is by right entitled to completely free entry of pulp and paper instead of only a partial freedom as under section 2."

## EDGINGS

### Ontario

The planing mill belonging to Geo. Brown & Company, at St. Mary's, Ont., was recently destroyed by fire, at a loss of \$10,000.

The name of the "Tait Carrs Lumber Company, Limited," Orillia, Ont., has been changed to the "S. E. Carrs Lumber Company, Limited."

Fire at Trenton, Ont., recently destroyed Sweetman's saw mill and a number of other buildings. The mill was insured for about \$4,000.

The Turner Lumber Company, Midland, Ont., have sold their holding in the township of Paxton, Algonquin Park, to the Standard Fuel, Iron & Lumber Company, of Toronto.

The Siemon Company, Ltd., Toronto and Lakefield, Ont., are not operating at Lakefield this season. They report however, that they hope to erect a manufacturing plant there during the present year.

H. M. Lickley, Limited, Gravenhurst, Ont., has been incorporated with a capital of \$100,000 to acquire and develop timber limits, operate sawmills and carry on business as timber merchants, etc. The provisional directors are T. H. Wilson, Wm. H. Smith, and R. Verity, all of Toronto.

The Little Current Lumber Company, Little Current, Ont., will operate its mill in the day time only during the sawing season of 1912. Formerly they have been operating both day and night shifts. This will mean that their cut will be reduced by one half, bringing it in all probability to about 13,000,000 feet.

Ingleby, Fitness & Taylor, 44 Burford street, Brantford, Ont., have commenced the erection of a planing mill to cost \$3,000. The building is to be two storeys high and 50 x 70 feet. The machinery to be installed will include planers, jointers, shaper, sticker, lathe, band saw, rip saw, mortiser, tenoner, one 25 h.p. gas engine and one 17 h.p. gas engine.

The Beaver Company, Limited, has been incorporated by Dominion charter, with head office at Ottawa, to manufacture and deal in pulp wood, wood-pulp, timber, etc., and also in roofing and sheeting papers, beaver board, etc. The incorporators include H. Riley, W. B. Stirrup, J. F. MacGregor, J. E. Riley and T. W. Lawson, all of Toronto. The capital stock of the company is \$500,000.

The Ontario Pulp & Paper Company, Limited, has been incorporated by the Province of Ontario, with capital stock of \$5,000,000, with head office at the City of Toronto, to carry on the business of pulp and paper manufacturers, etc. The provisional directors include J. W. Bain, F. R. MacKelcan, M. Lockhart Gordon, T. W. Lawson, J. E. Riley, H. Riley and J. Fraser MacGregor.

A Fort Frances, Ont., report states that the Edward Hines Lumber Co., of Chicago, has bought the large new saw mill of the Shevlin-Clarke Company at Fort Frances, and four large timber berths on Hunters' Island. It is also reported that the Shevlin-Clarke Company will build another mill even larger than the present one, a little further up the river. The proposed new mill is to have a capacity of 500,000 feet per day.

### Eastern Canada

It is reported that J. H. Parent & Frere will build a sash and door factory at D'Israeli, Que.

The plant of the St. Croix Paper Company, Limited, Halifax, N.S., was recently destroyed by fire.

The Montreal Box Lumber Company has been formed, Mr. Joseph Sauriol being registered as proprietor.

The Bathurst Lumber Company, of Bathurst, N. B., has increased its capital stock from \$100,000 to \$1,000,000.

It is announced that the Wayagamack Pulp & Paper Company's cut for this winter will be 1,500,000 logs, producing 40,000,000 to 60,000,000 board feet.

The E. B. Eddy Company, Hull, P. Q., are considering the erection of a large addition to their plant. It is stated that the work will be carried out this year.

The Falmouth Farmers, Limited, Falmouth Station, N. S., are considering the erection of a barrel factory and warehouse, during the coming summer. James Smith, C. N. Wilson and others, of Falmouth, are interested.

The Partington Pulp & Paper Company, St. John, N. B., are considering the erection of a paper mill at Union Point. The secretary-treasurer, Mr. H. W. Schofield, has just returned from England, where the project was under discussion.

The Saguenay Mills, Limited, have been incorporated by the Province of Quebec to own and operate saw mills, timber limits, etc., and deal in lumber and its products. The capital stock of the company is \$20,000 and the head office is at Montreal. The incorporators include J. S. Morgan and W. G. M. Morgan of Sorel, E. A. D. Morgan, E. Mauralt and P. Guevremont, of Montreal.

The town council of Aylmer, Que., have decided to prohibit the piling of lumber within the town limits. A by-law has been passed giving the R. & T. Ritchie, Ltd., one more year to pile green lumber inside the town, and until May 1st, 1915, to remove all the lumber from the town with the exception of 500,000 feet, which they will be allowed to pile inside the town for retail purposes.

### Western Canada

Fire recently destroyed the Independent Lumber Company's yards at Regina, Sask.

J. J. Grady, Creston, B.C., is reported to have sold his lumber business to A. N. Winelaw.

The South Vancouver Lumber Company, Limited, has been incorporated with capital of \$50,000 to carry on business as timber merchants, saw

mill owners and lumbermen in all its branches. The head office is at 103 Crown Building, 615 Pender street west, Vancouver, B.C.

It is reported that the Belle River Lumber Company, of Lake Nominique, Que., will make extensive additions to their sawmill this winter.

The Spanish Fuel & Construction Company, Limited, with headquarters at Winnipeg, has secured a Manitoba charter to carry on a wholesale and retail lumber and fuel business.

The sheds and lumber of the Coast Lumber Company at Regina, Sask., were recently destroyed by fire. The loss amounted to \$5,000, which is fully covered by insurance. The sheds will be rebuilt.

The Bulman Lumber Company, Cowichan, B. C., will shortly rebuild their sawmill on Salt Spring Island, which was recently destroyed by fire. A larger mill will also be built at Cushion Cove and the Victoria plant will be rebuilt.

The South Vancouver Lumber Company, Limited, Crown Building, 615 Pender street west, Vancouver, has been incorporated with a capital of \$50,000 to carry on business as timber merchants, lumbermen, mill proprietors, etc.

The Timber Realization Company, an extra-provincial company, has been registered in the Province of British Columbia with head office at the Metropolitan building, Vancouver. R. S. Babcock is attorney for the company. The capital stock is \$100,000.

The Pacific Door & Manufacturing Company, formerly an extra-provincial company, has been registered under the companies' act of British Columbia with provincial headquarters at 744 Hastings street west, Vancouver. J. S. MacKay is attorney for the company.

The Dominion Saw Mills and Lumber Company, Limited, the large English corporation, which within the last year or so have acquired extensive lumber milling interests in British Columbia, has decided to locate its chief office for the manufacturing end of the business in Calgary, Alta.

Lloyd's Investment Company, Limited, Winnipeg, Man., has been incorporated with a capital of \$40,000 to manufacture and deal in builders' supplies and to carry on a lumbering and mining business, &c. The incorporators are F. G. Light, N. A. McMillan and P. Shearer, all of Winnipeg.

The O. K. Lumber Company, Limited, has been incorporated by the Province of British Columbia, the object of the company being to take over the undertaking known as the O. K. Lumber Company, and to carry on business as timber and lumber merchants, saw mill and shingle mill proprietors, etc.

McDiarmid & Clark, Limited, Brandon, Man., have been incorporated with a capital of \$150,000 to carry on business as lumber and timber merchants, saw mill owners and dealers in wood and timber of all kinds. The incorporators are A. R. McDiarmid, J. Clark, Dr. J. McDiarmid and A. G. Buckingham, all of Brandon.

The sash and door factory of the Terminal Construction & Manufacturing Company, Limited, Kitsilano, B. C., was recently destroyed by fire. The loss is placed at \$25,000 which is fully covered by insurance. The plant included forty machines which were all destroyed, together with about \$8,000 worth of manufactured stock.

The Western Farmers' Lumber Company, Limited, Winnipeg, Man., has been incorporated with a capital of \$250,000 to carry on business as manufacturers of pulp, paper and wood products and to carry on a general lumber business in all its branches. The incorporators are D. K. Mills, J. Spencer and R. A. Bonnar, all of Winnipeg.

The lumber yards of the Rat Portage Lumber Company at Moose Jaw, Sask., had a narrow escape from destruction by fire recently, when the Robin Hood mills of the Saskatchewan Flour Mills Company, adjoining the yards, were destroyed. Only the combined efforts of a large force of men prevented the flames from spreading to the lumber piles.

The Alberta Pyrofugont Flooring Company, Bassano, Alta., have applied for a site for the erection of a planing mill for the manufacture of flooring. The intention is to have the plant in running order in about six weeks. Those interested are H. C. Strange, Bank of Commerce, Bassano, and Dr. J. J. Walters, Canadian Pyrofugont Company, Berlin, Ont.

The Empire Lumber Company, a subsidiary concern of the American Finance & Securities Company, of New York, whose limits are in the Cowichan Lake district, of Vancouver Island, will build logging railways to their limits. Shipments to the mill on tidewater will be made over a branch to be built by the C. P. R. This mill, however, will not be built for a year and will then be installed on the unit plan.

A. G. McLaren is asking the town of Lethbridge, Alta., for a grant of 50 acres of the river bottom for the construction of booms and other necessary fixtures for logging purposes. In return he expresses his willingness to construct a mill with a capacity of 40,000,000 feet per year, to cut the 735,000,000 feet of spruce which he controls in the Southern Alberta foothills. The Board of Trade is looking into the proposition.

The Bowsman Farmers Company, Limited, has been incorporated in the Province of Manitoba to carry on a general business of dealing in merchandise on the co-operative plan. The privileges of the company include the carrying on of the business of lumber merchants and saw mill proprietors and the acquiring of timber lands and limits and timber and wood of all kinds. The chief place of business of the company is at Bowsman, Man., and the capital stock is \$20,000.

The British Columbia Lumber Company, formerly the Pacific Coast Lumber Company, is erecting a \$500,000 mill on the upper end of Lulu Island, B.C. The present headquarters of the company are at Coal Harbor, Vancouver. The new mill will be about as large as that of the Canadian Western Lumber Company at Fraser Mills. The new company has placed an order for three large barges 120 feet long with 40-foot beam. They will have a capacity of about 750,000 feet of lumber each.

Six per cent. mortgage bonds, to the extent of \$1,000,000, of the Upper Fraser River Lumber Company have been offered to the public. It is stated that the company possesses over 281 square miles, or 180,000 acres, of timber lands on the Upper Fraser River. Many prominent lumbermen are on the board of directors. The Hon. W. C. Edwards, of Ottawa, is president, and Mr. Alex. MacLaurin, of Montreal, vice-president. Mr. C. J. Booth, of the J. R. Booth Company, Ottawa; Hon. D. C. Cameron, Lieut.-Governor of Manitoba; Messrs. W. H. McWilliams, of Winnipeg; H. M. Price, Quebec; W. Molson MacPherson, of Quebec; William Wainwright, vice-president of the Grand Trunk Pacific; G. W. Farrell, broker, of Montreal; and J. M. Mackie, of Montreal, are the other directors.

## The Barnhart Log Loader

has been in successful operation in all parts of the country for twenty years and never caused a complaint. We are now manufacturing a new Barnhart Loader known as Model "12," which is specially designed for use in very heavy timber. This loader is built on the same lines as the old Barnhart Loader now known as Model "10" and which we still continue to manufacture. We are operating lumbermen, producing 200,000,000 feet of lumber per annum and we use the Barnhart Loader exclusively. Could we afford to do so if it were not the best? Write us for prices.

# Time and Labor Saving Tools

## Long Service and Safety

The designing and making of Cutter Heads to accomplish certain desired results, is a technical matter and the business of experts in this line. Our experience has given to the machine woodworking world an easy system of making Flooring, Ceiling, Siding, Wainscoting, Ship Lap, etc., through the medium of the Shimer Cutter Heads.

These tools have also a distinct value to every maker of Door and Sash mouldings. There is no "fitting and trying."—no filing to shape at each sharpening of the cutters. We put the shape of your pattern permanently into the cutters we make and they are easily sharpened with a file or grinder and set with the gauge we furnish.

The Shimer Limited in solid section, Fig. 625. Groove Head with 8 Bits and the self-centering and spindle clamping features. Price \$33.50 each, complete.

Special features enter into the construction of the Shimer Cutter Head whereby every class of hard and knotty lumber is neatly finished. These features also enable the operator to quickly adjust the cut made by the Bits as they become dulled by constant use, or for the different conditions in which the lumber is found as it is supplied to the planer from day to day.

The Shimer Cutter Heads remain in fine working condition for many years and are practically indestructible. They are tooled out of our own special brand of Solid Steel Forgings, are well proportioned and perfectly balanced. The cutting bits are made from an especially high grade of steel and they work well in any

lumber, hard or soft with our usual filing temper.

It will pay you to investigate the merits of these tools. We assure you there is no better, no surer way, of adding to your mill's reputation, increasing your profits and building up a good business than by equipping your machines with the Shimer Cutter Heads.

We make it easy to do this, as we will make Heads to suit your work and send them to you on trial for 30 days.

Send order to-day for any of our tools that you can use, giving careful measurements of your machine, and we will run the risk of the Heads working to your satisfaction.

### Don't Burn Your Moulding

Blackened edges so often found in hardwood Mouldings indicate the use of inferior tools, which friction and burn because of their failure to have proper clearance. The Shimer Reversible and Non-Reversible Cut-

ters are made of the finest tool steel by experienced workmen. In design and construction they are superior to anything on the market. They cut well and retain their shape until worn out. Send us drawings or wood samples for estimates on special cutters. Many useful designs, with prices, are given in our catalogue.

The Shimer Limited, with Expansion, Fig. 628. Groove Head with 8 Bits and self-centering and spindle clamping features. Price \$36.23 each, complete.

Fig. 203 Popular Expansion Groove Head with 4 bit seats, complete, net \$20.48. Made also with 6 and 8 Bits to each Head.

### Panel Raiser Heads

For \$18.20 you can buy a Panel Raiser Head which will work nicely on any panel raising machine with vertical spindles. It carries a heavy shearing cut and works smoothly across end of panel as well the grain.

### Wood Forming Cutters

We manufacture Special Cutters of any shape and size desired after the patterns of our Reversible and One-Way Cutters. Let us have your specifications. For odd work not found in our catalogue send a wood sample or drawing.

### The Best Steel the World Produces

is represented in our B. D. Brand of Bits for the Shimer Cutter Heads. They hold an edge from one to five days at a single sharpening, according to the class of lumber they are used upon.

This special self-hardening steel under our treatment is very dense in grain—strong and tenacious—well calculated to withstand the knots as well as the fibrous cross-grain which is characteristic of the lumber of some localities.

Frequent stoppages of the machine to sharpen up results in the loss of a considerable amount of time and the object of these special bits is to

Fig. 23, a Popular Solid Groove Head with 4 bit seats, complete \$17.87. Also made with 6 or 8 Bits to each Head.

lengthen out the time between stops, securing longer service from machine and tools with each day's operation.

These Cutters are made only to order to fit any and every variety of the Shimer Cutter Heads, and must be ground to sharpen. They cannot be filed. For this purpose we manufacture two styles of Grinding Machines on which every position can be secured with reference to the hook and slant to suit the gauge lines, without taking the Cutters off the Head.

Thin Ceiling Bits cost only \$2.60 each; Bits for Flooring from 13-16 to 1½ inches cost \$3.25 each, and two-inch plank Bits \$3.90 each. In addition to the longer time between each sharpening, there is economy in using this steel, as it grinds slowly and does not waste as does other brands.

### Thin Steel Knives

made from this brand for planing and surfacing lumber, are recommended by users as the best that can be produced. Write us about your requirements.

Jointer Head, Fig. 55, with 4 Bits in line of work. Also made with 6 and 8 Bits to each Head. With four Bits \$16.64.

## A large industrial machine, likely a planer or shaper, with a heavy cast-iron base and a large horizontal table. A large flywheel is visible on the left side.

# Wire Rope

## For Every Requirement

We are specialists in the manufacture of wire rope. We can ship from stock any length or size of the wire ropes usually supplied and can manufacture specially a rope exactly suitable for your requirements. Perhaps you are having wire rope troubles—if so—drop us a line advising us your requirements and we will be pleased to make suggestions as to the class and style of rope you should use. We have had years of experience—and should know.

BIDEFORD - ENGLAND

## METROPOLITAN OIL CO.

Manufacturers High Grade Cylinder, Engine and Machine Oils and Mill Supplies, Etc.

### Mr. Saw-Mill or General Manufacturer:—

Are you willing to let us help you reduce the cost of lubricating your plant? If you are, we can do it, and believe this is a good time to call your attention to one of our Specialties. Lubricating Grease by our system has put many an extra dollar in the pockets of others, it will do so for you if you give us a chance, and you will be the gainer by the scheme.

Our Famous Lubricating Grease is a product that by common consent is admitted to save 50 per cent. in cost of Lubrication; fully 75 per cent. in cost of application. Continuous Lubrication, Economy, and Safety from Overheated Journals are the results of its use.

A post-card will bring Metropolitan Oil Company's samples and prices, or better still our representative, who will give you his advice, and expert services.

**METROPOLITAN OIL CO.**  
34 Atlantic Avenue - - TORONTO, ONT.

## LUBRIKO GREASE

is acknowledged by those who have tried it as

on application*

# IMITATION is the sincerest FLATTERY

## Plain Facts No. 2

The Number 77—capacity, speed of feed, and many details—has been imitated by all competitors. This would sound like boasting if it were not the truth. If the average mill-man were not acquainted with the facts, we would be cautious in making the assertion.

It is true and we are proud of it.

We are proud of another thing, too—the trade knows the difference between the *genuine* and the *imitation*. There was a time when some manufacturers thought they could make the mill-man believe that a new number made a new machine—we have never resorted to such a trick.

The No. 77, of course, is a better machine to-day than it was three years ago when it first came out, but that is no reason why we should put a new number on it; or give it a new name—no more reason than for you, because you are older to-day and advanced beyond what you were yesterday, should change your name from Smith to Jones or vice versa.

Mr. Mill-man, you are wise to the No. 77; you know what it is; you know the difference; let the other fellow “string” you if he will—you can smile when you think of the No. 77—*smile complacently*.

If it should happen that you have been too busy all your life to give much attention to our ads, or to our literature on the No. 77, we shall gladly furnish you information, if you will send us your name to be put on our mailing list.

*Write us direct, or our nearest selling office.*

# TO YOU

On this, the beginning of the New Year we tender a hearty greeting with our sincere wishes for your continued prosperity.

Your interests, as users, and ours, as manufacturers, are mutual and we take this occasion to express full appreciation of the trade you have given us.

On our part we shall spare no effort or expense necessary for the maintenance of that superiority of Quality, Workmanship, Design and Efficiency, which has been so characteristic of Disston Saws, Tools and Files, thus meriting a long continuance of your orders.

Yours very truly,

Hollow Ground Combination Tooth Mitre Saw

Patent Groover or Dado Head

For either Rip or Cross Cutting  
Will cut equally as smooth in either Ripping, Cross-cutting or cutting at an angle of 45 degrees, with grain of wood.

Allow us to quote Prices on Saws for any special work that you wish to do.  
**HUTHER BROS. SAW MFG. CO., Inc., ROCHESTER, N. Y.**

Can be used on any Circular Saw Mandrel  
For cutting any width groove from 1/8" to 2" wide. Will cut either with or across the grain. (Sent on approval).

## Timber Estimates

With increasing values in timber land, accuracy in estimates of standing timber is all important. We are practical foresters and make all estimates according to the most approved methods, assuring the smallest margin of error. We furnish forest maps showing the character and location of timber and the average stand in each, as well as the topography; also the blocking of townships in one mile blocks, a most necessary piece of work in the economic operating of timber lands.

A Large Land Company's Opinion of Our Work

"Just the Information Wanted"

Samuel F. Hersey Land Company,  
Bangor, Maine.  
Branch Office, St. Paul, Minn.  
St. Paul, Dec. 22, 1909.

Gentlemen,—

In reply to your inquiry of the 15th inst., we desire to say that the forestry work you did for us this year is entirely satisfactory to us. Your report and map were comprehensive and gave us just the information we wanted.

We shall undoubtedly call upon you again for further services of this character.

Very truly yours,

Samuel F. Hersey Land Co.,  
D. A. Mudge, President.

Messrs. Appleton & Sewall,  
Bangor, Maine.

We survey wild lands for the renewal of lines to prevent encroachment and to get actual acreage, the old surveys often being faulty.

We appraise for present and future worth—of particular importance to Bond and Banking Houses in connection with purchases and sales. Our Booklet F, "Applied Forestry," will prove of interest. Mailed upon request.

We are pleased to refer you to H. S. Ferguson, Engineer, 200 Fifth Avenue, New York City; Kathdin Pulp and Paper Company, Boston, Mass.; Bonne Terre Farming and Cattle Company, Bonne Terre, Mo.; Chicoutimi Pulp and Paper Company, Chicoutimi, P.Q., Canada.

**Carborundum Co.**  
NIAGARA FALLS, N. Y.

## Purchasers — And How To Locate Them

John Apsley Jenkins sells Hardwood trim. I met him yesterday, plodding along as though headed for the undertaker's. "Deucedly hard work digging up business—made nine calls to-day and not a dollar in sight" he confided.

Now, Jenkins is like nine out of every ten salesmen—spending their time making unproductive calls. They waste much time and good energy canvassing prospects that may want something, somewhere, sometime.

How can this waste effort be eliminated? How can knowledge of present and prospective markets be acquired quickly, efficiently, economically? How can this information be obtained, daily, from every town in Canada?

If you really want to know—drop us a line. Let us send you specimen reports relating to your business and explain our facilities for supplying you, daily, with information that will enable you to make sales.

## There's a Copy for You

If you are interested in selling a line of power transmission appliances that has strong talking points, that has distinctive merit, that has unique individuality, that appeals to manufacturers because it embodies the perfection of modern principles of power distribution and control, or if you are a manufacturer and contemplate using any new power transmission equipment, you want this catalogue, "The Positive Line."

You can't afford not to investigate Positive Combined Jaw and Friction Clutches, Combination Split Pulleys, Shaft Hangers, Pillow Blocks, Compression Shaft Couplings, etc., if you want to handle or use the line that is so entirely different, better and far in advance of existing designs of such appliances, that it has revolutionized the transmission of power in manufacturing plants and has established a higher standard of dependability, durability, economy and efficiency in industrial operations.

The catalogue also contains some handy engineering tables and formulae. When you ask for it, don't fail to state, "Second edition of The Positive Line."

**B**Y doing perfect work of this kind, (No. 117 Siding) at 200 feet per minute, the "Three-Double-Three" with profiler, is proving itself to be "The New Speed King." Heretofore the best record on No. 117 Siding was 150 feet. The efficiency of the high speed planers is now beyond doubt. The question now is—"Which is the *most* efficient?"

We can demonstrate to you both theoretically and practically, that the "Three-Double-Three" is at least 25 per cent more efficient than any other planer and matcher now made. Give us a chance. Special pamphlet and sample of this siding worked at 200 feet per minute, **FREE** upon request.

# INDUSTRIAL LOCOMOTIVES

Persistent specialization, careful testing of all materials and painstaking care in manufacturing have produced our standard locomotives for logging operations and switching around industrial plants.

These locomotives are the product of engineers and manufacturers who thoroughly understand conditions surrounding their use. These conditions require powerful and sturdy locomotives which will give maximum work for minimum attention. It is important that the boilers should be ample in capacity

and that they should be tight and remain so. Also that the machinery should be rugged for service with ample surfaces for wear. Parts that will wear should be accessible for easy renewal.

Our standard locomotives embody these features, combined with wide experience. To do yourself justice you should investigate them before purchasing.

Spare parts that are sure to fit are always on hand for prompt shipment.

# Automatic Box-Board Squeezer

## BUILT IN FOUR SIZES

Will assemble all kinds of matched stock used for packing boxes. Can be changed to handle entirely different sized stock in less than two minutes.

Saves labor and by making the tongues and grooves fit tight the finished product handles practically as one piece.

We also manufacture :  
Horizontal Slab Resaws, Horizontal Hopper Feed Box Resaws and many other Special Box Factory Machines.

U. S. A.

## Solid and Inserted Tooth Circular Saws

*We make a specialty of these lines*

**We remake old Solid Tooth Saws into new Inserted Tooth Saws**

*Write to us for quotations*

Our saws have been before the public of Canada since 1855, and have won a reputation far exceeding any other make of saws, combining as they do so many points of marked superiority.

**By the old method** the tempering of circular saws was to a great extent a matter of chance.

**By our Patent Process** that uncertainty is entirely avoided.

Being tempered and straightened by heat and pressure in air-tight ovens at a uniform heat between heavy revolving plates, we produce a perfectly even temper throughout the plate, and being free from that uneven strain or tension caused by so much unequal hammering they are not so liable to buckle, which was a great source of trouble and expense in the old style of saw.

These saws will stand up to their work better under all circumstances, and being made of a higher quality steel than it is practical to use by the old method, they hold an edge longer and will do more work than any other saw on the market.

We are prepared to make prompt deliveries of all Saw Orders—Rush Orders by mail or wire receive immediate attention.

## "John Bull" Larrigans

**Wear Like Iron**

**W**E tan the leather these larrigans are made from and know they will stand all kinds of wet and rough usage when properly cared for. We put a counter stiffener in our larrigans and sew it in with the leg when soled and heeled—a very durable feature in our goods.

Next time you buy larrigans see that you ask for "**John Bull.**"

Limited

## The "Midland" Band Wheel Grinder

After this machine has been attached to the Frame of the mill it can be adjusted and put to work in twenty minutes.

**One Setting Grinds Both Wheels.**

The whole operation done before you can get enough timbers together to rig up any of the Grinders now on the market. Every Sawmill man knows that Band Wheels should be ground

oftener than they are, but with the heretofore existing appliances this operation meant a shut-down for two or three days. With **THE MIDLAND** you can grind up at any time, and by keeping your wheels in shape make and save money.

---

**No. 300 Heavy Duty Inside Moulder**

The advantages of a Moulder and a Planer and Matcher are combined in the machine illustrated above. Ease and speed in adjustment are insured through special unique features, not contained in any other type of machine. The method of lubrication is perfect. The general construction is after the plan of the planer and matcher, having heavy sides connected by heavy girths which in combination with a series of platen plates form the bed.

**No. 300 Heavy Duty Inside Moulder**

The special features of this model machine include truing devices for top, bottom and side heads, which insure all knives doing an equal amount of work. Six speeds are furnished through friction feeds. Top rolls are made with pull-out shafts, and extra rolls are supplied, all interchangeable. Matcher frames swivel, ample expansion for all bars and chipbreakers. Made in two sizes 15 x 6 and 12 x 6.

¶ Our rates are low and results come quickly.

# Canada Lumberman and Woodworker

TORONTO - CANADA

## Makes It's Mark Vivid and Lasting

Marks that remain vivid and wear like iron are a real satisfaction to the man who handles lumber. The metallic pigments, like graphite, of DIXON'S LUMBER CRAYONS offer marvelous resistance to all kinds of weather conditions. Their marks are often visible after six months of severe exposure to sun and storms.

# DIXON'S LUMBER CRAYONS

have always remained the recognized standard because of their one, uniform and dependable quality; their convenient and uniform shape and size and because of the careful selection of materials used in their manufacture. DIXON'S LUMBER CRAYONS are made in nineteen grades and colors, including black (six grades), red (two grades), blue (two grades), green, white, yellow, brown, terra cotta, violet, pink and orange. Some are made to fill particular needs—let us tell you more about them. Get acquainted.

Write for lithographed booklet No. 239, illustrated in colors.

32" — 2 saw edger for portable or light stationary mills

**T**HIS edger combines more of the important points in the machine, than any other edger of its size on the market. It can be made to suit either a right or left hand mill, by taking out four bolts and turning the top of the machine around, which does not disturb the mandrel. The top rollers are self raising, and raise towards the rear of the machine. This makes it impossible for boards to fly back out of the machine. The end bearing may be removed, which allows the saws to slip off the end of the mandrel, without disturbing it in any way. There is a top roller, which is convenient for passing boards back over the top of machine.

WARDNER, B.C.

# STEEL PLATE WORK

**T**O make a success of building Steel Plate Work, in which practically every job is entirely new and of special design, it is absolutely essential that everyone connected with it—from the designing engineer to the boiler-maker—is up-to-the-minute in his particular field, and further, has more than a little practical experience to back him up.

It is the kind of work that tests out a boiler shop. WE MAKE A SPECIALTY OF IT.

At present we are getting out a catalogue of 24 pages showing some of the difficult jobs we have handled in the last few years.

The 1911 extensions to our shops have placed us in a better position than ever before to do this special work. Our facilities in every department have materially increased—we have the men, the equipment and the experience—and for this reason we are going after this kind of work instead of waiting for it to be put up to us.

We attach a list of plate work that we are turning out every day. If you are interested in getting anything along similar lines, send us your sketch, and we will be glad to quote.

# Annual Statistical Number

# Edgers for Medium Size Mills

Our "Star" Edger has been designed and built specially for mills of medium capacity where a first class edger is wanted, but where it would not be economical to put in one of our larger and heavier "Garland" Edgers.

The frame is all cast iron of heavy section, the mandrel is large and stiff. The Edger has a heavy press roll behind saws and the fingers in front prevent the lumber coming back. The feed rolls are corrugated and made of steel and are driven. In fact this edger is as well constructed throughout as the edgers of larger capacity. It is in no sense a portable edger, but is built for the most exacting requirements.

**Made in all sizes up to 40 inches**

### XXX Genuine Balata Belting.

The most reliable textile Belt in existence

Specially adapted  
for cross running

Made from best quality Cotton Duck impregnated with Balata by the latest process, thoroughly stretched by hydraulic machinery and subjected to heavy pressure, making the material absolutely solid. It is perfectly waterproof, not influenced by climatic changes.

Suitable for all classes of machinery as it never loses its splendid and unequalled qualities of durability and driving power wherever used, be it in dry, damp or dusty places, or in the open. **GET UR PRICE LIST**

"Nothing cheap is ever good—  
But anything good is always cheap."

### "Vitite" High Pressure Packing

is just what its name implies—a packing designed to meet the requirements of users of high steam.

It is light in weight and stands the test.

Sizes in stock

1/32 in., 1/16 in., and 1/8 in.

75c. per pound

### Lumber Drivers' Boot Calks Beaded

Made from the best Refined Tool Steel and forged. If McAvity Calks cannot be procured in your vicinity, send direct to us.

### "World-Goetze" No. 2 Gaskets

Elastic Corrugated  
Copper with  
**Asbestos Lining**  
make **positively** and  
**permanently tight**  
**joints** in flanged piping  
where nothing else will  
— where the best of  
other Gaskets fail.

### "Victor 200" Valve Discs

Made of Elastic Copper with Asbestos Core. For Valves of Jenkins' or similar types the most effective combination that has been worked out.

They outlast six rubber or composition discs three to one and are the best Valve Discs on the market.

Obey that impulse to do a wise thing and send us your trial order to-day.

A good assorted stock of Dimension Timber and Joisting on hand.

On request we will be glad to mail you copy of Stock List of unsold Lumber.

**The Colonial Lumber Company Limited**  
Pembroke, - - - - - Ontario

Patented 1911  
**No. 152 Long Leg Seam-  
less Heel, Draw String  
Moccasin**

The latest improvement in Moccasins doing away with all seams at heel. Under the old method the heel would come down and in a short time the wearer would be walking on it, wearing out the stitching, thus causing it to leak and rip. With the new process the heel will not flatten out, will always keep its shape, and there are no seams whatever making a clean smooth RIPPLES and WATERPROOF heel.

Made only in the highest quality, all heights of leg, with or without soles or heels.

**The McCASKEY  
SYSTEM**

The End of  
Drudgery.

**Specially Adaptable for the Retail Lumber Dealer and  
Commissary Store.**

*With one writing, the McCaskey Gravity Account Register will handle every detail of your business from the time the goods are bought until the money for them is in the bank.*

*It automatically limits credit and flags the merchant at every danger point.*

Your customers get a copy of each and every purchase at the time it is made. This copy shows the date, the clerk that sold the goods, the items comprising the same, the amount, the balance brought forward, and the grand total due by the customer down to the minute.

There is no chance for dispute.

The "McCaskey" is an automatic book-keeper that makes no mistakes, displeases no customers, has no temptations.

It is ready for business any minute of the day, never late for work—and draws no salary.

The McCaskey Gravity Account Register is admirably adapted to the needs of the dealer with 50 or the merchant with thousands of accounts.

It is equally satisfactory to the Lumberman, or dealer in **camp supplies**, grocer, butcher, or baker—drygoods, hardware or drug store—as well as merchant, manufacturer or professional man in any line of business.

Over 60,000 merchants, storekeepers, manufacturers and lumber dealers have proved the "McCaskey" a money saver and a money maker.

Learn about the "McCaskey" today. Send the attached coupon for booklet, "Book-keeping without Books." It is really a gold mine of information that will assist you in stopping the leaks and losses in your business.

**Dominion Register Company, Ltd.**

94 ONTARIO STREET, TORONTO, ONT.

## Smooth, True Sawing

IF your boards from the carriage or resaw are sawed 1" you can cut them  $31/38$ " on a Wickes Gang (many cut as thin as  $15/16$ " and yet have sufficient stock for the planers.)

Because of the smooth, true sawing of the gang, the planer will dress both sides clean the entire length on a very light shaving.

No miscuts due to loose carriage or resaw joints to allow for. No wavering, snaking or running of saws to contend with.

This is actual, practicable Conservation of Resources. It is a marked saving of timber. It means

## METROPOLITAN OIL CO.

Manufacturers High Grade Cylinder, Engine and  
Machine Oils and Mill Supplies, Etc.

**Mr. Saw-Mill or General Manufacturer:—**

Are you willing to let us help you reduce the cost of lubricating your plant? If you are, we can do it, and believe this is a good time to call your attention to one of our Specialties. Lubricating Grease by our system has put many an extra dollar in the pockets of others, it will do so for you if you give us a chance, and you will be the gainer by the scheme.

Our Famous Lubricating Grease is a product that by common consent is admitted to save 50 per cent. in cost of Lubrication; fully 75 per cent. in cost of application. Continuous Lubrication, Economy, and Safety from Overheated Journals are the results of its use.

A post-card will bring Metropolitan Oil Company's samples and prices, or better still our representative, who will give you his advice, and expert services.

# Goodhue Belts

Guaranteed  
Reliable  
and  
Economical

—the belts that STRETCH LESS by 15% to 25% than any other leather belts on the market. Think also what a saving "Goodhue" Belts mean in belting, you can't use the short lengths taken out every time slack is taken up. All unstretched parts are carefully excluded in the make-up of "Goodhue" Belts, which in point of satisfactory and lengthy service have no superiors anywhere.

When "quality" is taken into account "Goodhue" Belts will be found the cheapest on the market.

According to conditions under which the belt has to run we recommend :-

"Extra," "Standard" or "Acme Waterproof"

Canadian Representative: W. J. Anderson, 288 South Street, London, Ont.

There is this, that you can count on, in all Simonds Canada Saw Company's Circular Saws, solid or inserted tooth, whatever the gauge, whatever the tooth, whatever the use—Uniformity.

Buy a Simonds Saw to-day and duplicate your order any time afterward, and you get the same temper, the same material, the same trueness, the same adjustment, the same finish, the same strength, the same cutting qualities, the same all around satisfaction, that you got in your first purchase, and that led you to call again for a Simonds Saw.

No time was too long, no effort too vast, no pains too great, for us to take in securing the Simonds Standard of Quality of Saw, and there is nothing on this globe that can hold us back from maintaining the uniformity of that standard.

We make every kind of Saw used in lumbering and mill work, and on woodworking machinery, Cross Cut, Band, Gang, and Solid and inserted Tooth Circulars.

*(To buy right—let your order read Simonds)*

# Richest and Purest Milk

from the choicest dairy sections of Canada. From cows properly fed and cared for

## Borden's PEERLESS BRAND Evaporated Milk

Dilute with water to desired consistency and use same as "fresh" milk.

**Convenient**

**Economical**

**Safe**

Located in the heart of the world's best dairy district at TILLSONBURG, ONT., is our new and modern Borden Condensary, equipped throughout with the most sanitary milk-handling utensils known to science. The entire milk supply comes from dairy farmers nearby, whose herds are all under the strictest supervision of our own experts. The greatest care is taken with the cows, barns, dairies, etc. The Borden Inspectors regularly visit each dairy, and every farmer is required to constantly maintain the highest standard of cleanliness and healthfulness. Even the feeding is on a scientific basis, and no milk is accepted that does not pass the severest test as to quality, butter fat, nutrients, temperature, and in any other particular, and this milk supply, coming as it does from such well-regulated source, and the best dairy animals, is bound to be of FULL FOOD VALUE and of even quality without variation.

All ready roofings—except J-M Asbestos (stone) Roofing—are made of so-called felt composed of animal or vegetable fibres. When these fibres were growing, they lived upon the ground or animal from whence they came, and received their life therefrom. So every fibre of this nature is hollow, like a straw.

These felts are waterproofed with coal tar, asphalt and oil, or other volatile compositions which quickly evaporate when the sun reaches them. Therefore, the sun

quickly begins its deadly work of taking these oils off the surface in such roofings; and then continues to draw them out of the inside through the strawlike fibres of which the felt is composed, until the roofing becomes dry and porous and is no longer waterproof.

J-M Asbestos Roofing is unlike other roofings, because its felts are made of stone fibres which are solid. These solid fibres defy the action of the sun's rays and positively prevent capillary attraction, thus hermetically sealing all of the oils so they must remain to do their duty indefinitely.

### J-M ASBESTOS ROOFING

is not merely one sheet of waterproofed stone felt, but several layers cemented together with nature's wonderful waterproofer—Trinidad Lake Asphalt. This asphalt is also hermetically sealed, making any escape of oils or asphalt impossible.

Prove for yourself that sun will soon destroy the waterproof quality of ordinary roofings. Focus the rays of the sun through an ordinary sun or magnifying glass and note results. This, in ten minutes, will show you what sun will do in a few months.

This simple sun-glass test is as severe in its way as our famous blow-torch fire test. It will show up the shortcomings of a roofing before you pay out your money.

Because of its stone nature, J-M Asbestos Roofing also never needs painting, and is fire-proof, acid-proof, rust-proof and rot-proof.

# How This Rubber Belting Cuts Production Cost

Don't let slipping belts waste power—drain away profits. Plug up the leaks—save time, money, *power*, by investigating—installing Goodyear Rubber Belting.

Goodyear Rubber Belting stands for *saved energy*—**economy**. Built up of plies of rubberized fabric, cured and vulcanized into the solid piece. Neither slips nor stretches. Has the cohesiveness of rubber with the enduring strength of a specially woven cotton duck fabric from which all stretch has been taken out. It is steam, water, weather and rot proof.

The same high grade materials, the same skillful workmanship and the same years of experience that have built such famous service into the products of the Goodyear Tire & Rubber Co., U.S.A., is doing the same for Goodyear Rubber Belting and our many other rubber products.

## **GOOD** **YEAR** Rubber Belting

### High Efficiency Belting

Every size for every purpose—1 inch to 60 inches wide—2 plies to 8 plies thick.

### Goodyear Quality Belting

The highest grade made. Heaviest duck, best rubber, seamless, tough, durable. The saving main-drive belt for **Paper, Pulp** and **Lumber Mills**—for *all* mills where the horse-power transmitted is large and the demand for tensile strength is great.

### Black Diamond Belting

Lighter in weight, lower in price than above, but same in *quality*. Great quantities sold to **Sawmill** trade. Hundreds of mill owners say it gives better service than any other belt ever used.

### Red Cross Belting

The ideal belt for **Thresher, Small Sawmill** and **Flour Mill** use. Built to meet competition, yet is far superior to all other third-

grade belts because made of tougher rubber, heavier fabric (which means better friction) and better wearing service and cover.

### Stitched Rubber Belting

We make this belting in **Quality, Black Diamond** and **Red Cross** weights for those preferring this type of belting.

### Elevator Belts

We make a specialty of **Elevator Belts**. Our Leg and Lofter Belts used in hundreds of elevators. Give superior service because of greater strength. Buckets never pull out. Plies never separate. Long efficient service guaranteed.

### Conveyor Belts

For conveying crushed stone, grain, coal, ore, etc. Made in all thicknesses of face to suit requirements. Great toughness of rubber face prevents cutting and chipping, insures longest service.

## IMPERIAL HIGH-SPEED FRICTION SURFACE BELT

Specially designed for planer, dynamo, generator or fan work where pulleys are small and high-speeded. If we haven't what you want in stock, we'll *make* it—and *remember*

Goodyear Rubber Belts quickly earn their cost in pains and power saved—yet they cost less than the common kind. Let our expert solve your problem. Send requirements or write for catalog to-night.

In all of our business in Canada last year, we had to replace because of slight defects, only \$155.22 worth of goods.

## TERMS OF SUBSCRIPTION:

Canada, United States and Great Britain, \$2.00 per year in advance; other foreign countries embraced in the General Postal Union, \$3.00.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

## Tariff Commission To Be Appointed

The decision of the Dominion Government to appoint a tariff commission will be received as promising news by lumbermen in Canada. They will now have a definite body before whom to lay their claim for fair treatment in the form of protection against U. S. lumber equal at least to the duty on Canadian lumber entering the United States. The duties and powers of the commission as defined in a resolution presented by the Minister of Finance, are as follows:

1—To make, under the direction of the Minister of Finance, in respect of any goods produced in or imported into Canada, inquiry as to:

(a) The price and cost of raw materials in Canada and elsewhere, and the cost of transportation thereof from the place of production to the place of use or consumption;

(b) The cost of production in Canada and elsewhere;

(c) The cost of transportation from the place of construction to the place of use or consumption, whether in Canada or elsewhere.

(d) The cost, efficiency and conditions of labor in Canada and elsewhere;

(e) The prices received by producers, manufacturers, wholesale dealers, retailers and other distributors in Canada and elsewhere.

(f) All conditions and factors which affect or enter into the cost of production and the price to the consumers in Canada;

(g) Generally all the conditions affecting production, manufacture, cost and price in Canada, as compared with other countries, and to report to the Minister.

2—To make inquiry into any other matter, upon which the Minister desires information, in relation to any goods which, if brought into Canada or produced in Canada, are subject to or exempt from duties or customs, and report to the Minister.

3—To hold, when empowered by the Governor-in-Council, an inquiry under section 12 of the Customs Taric, 1907, in the same manner as the Judge of the Exchequer Court, or any other Judge therein referred to, may hold inquiry when so empowered.

4—To inquire into any other matter or thing in relation to the trade or commerce of Canada, which the Governor-in-Council sees fit to refer to the Commission for inquiry and report.

The Commission is to consist of three members.

## Forest Fire Waste

An interesting address was recently delivered by Mr. Percy Robertson before the Insurance Institute of Toronto, on the subject of Forest Fire Waste. Dr. B.E. Fernow, Dean of the Faculty of Forestry in the University of Toronto, commenting upon the address writes as follows:—Mr. Robertson has given in the briefest possible compass, yet in most convincing manner a proper appreciation of what I would call the national calamity, if not disgrace of Canada. To realize what continual neglect or incompetency in dealing with the problem of protecting timberlands from fire means to the future of the Dominion one must take into consideration that in the Eastern provinces not less than 75 per cent. of the land area is fit for nothing else than timber growing, and by the repeated burning over even this possibility of securing values from the poor, thin soils which cover the Laurentian rock, is destroyed. And the situation in British Columbia does not promise anything better.

Strange as it may sound, the loss of standing timber by fire is not at all the greatest loss; the much greater loss is the destruction of the soil itself and of the young growth that may have established itself. This means destruction of all future crops, and rendering the bulk of the land useless. Annually, the man-made desert of Ontario grows, and the authorities do not even realize that the fires that run through the slash do definitely more injury than those which scorch the merchantable timber. While the expenditure of, say \$350,000 for fire protection,—which is about what the provinces and Dominion spend for it,—is not much when compared with \$25,000,000, which is the loss in property from forest fires recorded in 1908. It is made even less effective than it could be made, through lack of competent organization and through the employment of incompetent agents.

In the United States, especially in the Pacific Coast cities, it looks as if the problem promises soon to be solved by associated effort of lumbermen, who are timberland owners.

In the Dominion, timber limit holders can hardly be expected to take the same interest. The owner of the soil alone may be expected to take interest in the future, and that in Canada is mainly the people themselves and their governments. The people have to blame themselves for their governments' supine and self-destructive incompetency and mismanagement of the resources which are theirs. A more active interest on the part of the fire insurance men in remedying this mismanagement would at least sound like a rational proposition.

## Canadian Lumbermen's Association

The Annual meeting of the Canadian Lumberman's Association which is to take place on Feb. 6th, at Ottawa, and which is to be followed by the Annual convention of the Canadian Forestry Association on Feb. 7th and 8th, will be by far the most important meeting of lumbermen which has ever been held in Canada. Representatives from the lumber industry in all parts of Canada will be present and matters of the utmost concern will be discussed. Possibly the most important feature of the meeting will be a proposal to reduce the entrance fee of the Association from \$50 per year to \$25. During the early years of the Association, a fee of \$50 was considered necessary in order to secure sufficient funds to carry on the work while the membership was small. The Association has grown in numbers and importance since then and it is now believed that a much more representative and influential association would result from the reduction of the entrance fee.

# Canada's Trade in Lumber During 1911

**A Year of Many Vicissitudes—Home Markets Offset Foreign Depression to Large Extent—Greatly Increased Imports of U. S. Lumber—The 1912 Outlook**

During the year 1911 Canada commercially was prosperous. Nothing stands out more clearly in the history of the year that has passed than the contrast between the commercial and financial conditions which prevailed in Canada and those which characterized the business life of the United States. In Canada, with few exceptions the great industries of the country were prosperous. In the United States the year has been one of unrest and uncertainty. The most general tendency in United States business has been hesitancy, caused in a large degree by uncertainty as to the intentions of the present government of the country in regard to the industrial interests and doubt of the outcome of the Presidential elections which—rightly or wrongly—are always allowed to exert a detrimental influence upon business conditions.

There would be only a passing interest in the United States situation, for us in Canada, were it not that these conditions are allowed to exert an appreciable influence upon Canadian industry and finance. For the lumbermen of Canada, moreover, the conditions in the United States are fraught with much importance. Some of the large industries of the United States have been experiencing greater prosperity of late months than others, as evidenced by the advancing price of copper and the improvement in the trade in cotton goods. But there has been little in the year upon which the lumber industry of the United States could congratulate itself. The lumber trade has suffered from widespread depression and this depression spread to the trade in Canada, becoming one of the contributing causes of the dullness which, in many important lumber producing sections of the country, has been unpleasantly noticeable.

## Canadian Lumber Markets Were Good

Broadly speaking there are for the producers of lumber in Canada—the home market and the foreign. If the trade of Canada has depended solely upon the home markets, the record of 1912 would have been one of the most satisfactory on record. The building record for Canada, which is published elsewhere in this issue, takes in the twenty-one principal cities of Canada and shows that there has been an increase in the amount of money invested in buildings of easily thirty per cent. The total expended upon buildings during the year 1911 in Canada was \$119,149,663. The lumber industry shared in the orders for materials for these buildings to a large extent and as a result the lumber trade found, in many parts of Canada, particularly in eastern Canada, that the local demand for lumber was well maintained at a vigorous level throughout the year. As usual it is noticeable that the most active part of Canada, so far as the building record is concerned, was the west. This was unfortunately not a great cause of congratulation to the lumbermen of the west. The great markets of the prairie provinces, which consume enormous quantities of lumber, formerly bought the bulk of their supplies from Canadian lumbermen. This year a sudden change came over the trade. So great was the depression in the United States that the important lumber producing States of the west found themselves with enormous over supplies. Their first course was to look to the prairies of Canada as an outlet and they adopted every known means of dumping their surplus upon the Canadian markets and destroying the business of the British Columbia and Prairie province mills. A single instance of this will suffice to illustrate the point. One of the large operators on the British Columbia coast reports instances of No. 1 sized dimension, 2x4, 2x6, 2x8, etc., being sold by good Puget Sound mills for \$5 per thousand f.o.b. cars and V. ceiling, flooring, etc., for \$8.50 to \$12 f.o.b. cars. Apparently the situation with the United States mills has been one of accepting any price at all which would provide them with a little ready money, rather than carry over stock or fail in their payments to the banks. The British Columbia lumber manufacturers could do nothing in the face of this class of competition and accordingly a great majority of the houses and business buildings which were required for the expansion of the Prairie provinces were built of United States lumber.

In Ontario the building situation has shown features not unlike those of the prairies. The distinguishing feature of the lumber trade in Ontario has been the great amount of southern pine lumber which has been imported into the country. When one considers that this southern lumber is brought to Ontario on a long freight haul and sold there in competition with the product of Ontario mills, it becomes apparent that the increasing sales of southern pine

can be accounted for only in one way. It cannot be manufactured, much less sold at the prices for which it is sacrificed in Ontario today. It is being dumped in Ontario for the same reason that the products of the Pacific Coast States mills are being dumped in the Prairie provinces. There is an overwhelming overproduction which cannot be absorbed in the home markets and the surplus has to be sacrificed in a foreign market so as not to increase the demoralization of the home markets.

## A Strenuous Year for Maritime Trade

In the Maritime Provinces of Canada the year 1911 was also a strenuous one for the lumberman. In New Brunswick the year opened in an encouraging manner, but it was not long before clouds began to gather on the horizon. In the first place the cost of labor in the woods increased beyond all former records. This would not have been a serious matter if other conditions had not combined to discourage the industry. There was a large cut in the woods during the winter of 1910-11, but the logs which were cut met with adverse driving conditions and many millions were hung up in the woods. The spring freshets failed to a greater extent than ever before and the result was a great shortage in the quantity of logs brought to the mills. Another result is that the operations in the woods this winter will be greatly reduced, both as a measure of caution on account of the uncertainty of the future and also because of the fact that there are still in the woods so many logs which were cut last winter.

High cost of labor and the failure of the freshets however, were only the commencement of the troubles for the lumbermen of New Brunswick during 1911. Their principal market—Great Britain—seemed to promise well at first but it was not long before strikes, among the railroad men and the sailors, crippled the commercial life of the country and the demand for lumber fell off for the time being almost to the vanishing point. The transportation companies suffered also and as a natural result shifted the burden of their loss as much as possible. The result was increased freight rates. Once again the lumber industry in the Maritime Provinces was badly hit. Notwithstanding all these discouragements the manufacturers and exporters of lumber in the Maritime Provinces are approaching the 1912 season in an optimistic spirit and hoping for the best. The lessons of the past year however, will bear fruit and operators are already trimming their sails with a view to being prepared for another period of depression if necessary.

Nova Scotia sells a large part of her output of lumber to the United States. Most of this is hemlock. The United States markets on the whole during the year 1911 were unsatisfactory. There was however a fairly well maintained demand for a limited quantity of Nova Scotia hemlock and prices were steady throughout the year at from \$11 to \$12.50 f.o.b. according to specifications. The outlook for the hemlock trade for 1912 is considered fair but there is the presidential bugaboo to face; a factor, the influence of which cannot be estimated in advance.

A fair demand throughout the year was reported for Canadian lumber in South Africa. In the West Indies the demand was quiet.

## Exports to England Decreased

In the Province of Quebec as in New Brunswick and Nova Scotia the exporters of lumber were seriously affected by the conditions already cited which militated against an extensive trade with Great Britain. The labor troubles in the Old Country, high freight rates on the transatlantic vessels and also the shortage of cars in Canada and inadequate accommodation at the port of Montreal for the handling of lumber, resulted in a decrease of exports to the Old Country. The exports of lumber to Great Britain from Montreal declined by 14,408,373 feet B.M., the total reaching only a little over one hundred million feet. In addition to the factors already mentioned an important feature of the trade which assisted in reducing the shipments from Montreal and other Quebec ports was the strong competition which red pine met in the Baltic woods. The higher level of prices in Canada during 1911 caused importers in Great Britain to turn more of their attention than formerly to the cheaper grades and the movement and consequent strength in the cheaper grades was a gratifying feature of the year's business. Exporters in Quebec Province are not over-confident regarding the prospects for the year 1912. The freight rates are still troubling them and according to present indications further advances in trans-

atlantic freight rates are probable. This together with strong competition from the Baltic may reduce the exports still further, though, with a reasonable freedom from labor troubles in the Old Country, it is believed that a steady and fairly satisfactory trade may be expected.

The pulpwood trade of Quebec experienced a good year, though this is not altogether an unmixed blessing. The demand from the United States resulted in the export of 779,000 cords to that country during 1910 which were valued at \$5,000,000. If this pulpwood had been kept in Canada it would have provided the raw material for 56 mills of the average size of those operating in Quebec. Some compensation for this enormous export of the raw materials of the country is to be gathered from the figures of the export of wood pulp from Canada. The pulp-wood production in Canada during 1910 was less than in the previous year but the exports of wood pulp to the United States increased by 48,233 tons or six per cent. Three-quarters of the wood pulp produced was exported to the United States. During the year 1911 the wood pulp trade of Quebec received a temporary stimulus from the free admission into the United States of wood pulp made from wood grown on privately owned lands. This however, was only a temporary favor and has already been withdrawn. Canada found a market in the United States in 1911 for 275,000 tons of wood pulp valued at \$5,200,000, and for 55,000 tons of news paper valued at \$2,000,000.

#### Prosperity Among the Hardwood Trade

The year 1911 was one of the best business years that the Canadian hardwood lumberman has experienced. There may have been years when a few of them realized greater profits, but during 1911 prosperity was general in this branch of the lumber business. At the opening of the business year considerable fear was felt on account of the quietness prevailing in the United States markets, but as the year advanced the general prosperity of Canada opened up new fields for the hardwood trade through the enormously increased demands of Canadian manufacturers who use hardwoods as a raw material. The general prosperity of the farmers of Canada, added to our rapidly increasing population, resulted in a good demand for hardwood lumber from implement and vehicle manufacturers as well as from the builders of new homes and from the furniture manufacturers who must furnish the homes.

The continuous growth of the country and its increasing prosperity were accompanied by railroad development on an enormous scale. As the railroads reached out into new fields they had to increase their rolling stock. Thus another branch of industry called upon the hardwood trade for supplies. The increasing prosperity of the country caused a demand also for a better class of interior trim and again the hardwood trade felt the benefit. The same applied to furniture, pianos, etc. So it has gone on all along the line, until to-day, Canadian hardwood lumber manufacturers are able to sell most of their lines at home and are fast becoming independent of the United States buyer. This, more than anything else, has been the history of the Canadian hardwood business during the past year.

About the only weak spot in the hardwood trade during 1911 was the difficulty in marketing the low grade. Continued depression in the prices of the lower grades of soft woods, owing to the

dumping of yellow pine into our markets caused a corresponding depression in the lower grades of hardwood lumber.

An interesting feature of the year's trade was the increasing tendency to buy and sell hardwoods strictly according to grade. Just as in the United States, buyers of hardwood have reached the point where they buy the grade of lumber they want and that grade only, and buy it moreover from the man who furnishes a uniform grade, so our Canadian manufacturers are rapidly coming to the point where they will not buy a log run article if they require firsts and seconds, but will buy exactly what they want, whether it be firsts and seconds, or number one or number two common, and they now find that it pays to deal with a man who will furnish them the uniform grade.

The past few years have placed the Canadian hardwood lumber business on a much firmer basis, with a more uniform set of grading rules, until to-day a number of our Canadian hardwood men are recognized both in Canada and the United States as putting up hardwood lumber on grade which cannot be disputed or discounted by anyone.

With a good winter, the prospects for the hardwood lumber business for 1912 were never brighter. All our manufacturers are working to full capacity and increasing their plants, while the enquiry from the United States market is much improved and the hardwood man has every reason to feel cheerful.

The basswood trade was firm throughout 1911 in all the different grades. The high ends were in good demand for carriage making, the medium quality for furniture and mouldings and the low grades for crating and boxes. The markets were firm at the beginning of the year 1911 and continued so throughout the year.

Stocks of thin elm both in the good and cull ends, were taken up closely by the furniture manufacturers and were also in good demand for crating purposes. Thick elm was almost entirely absorbed by the piano trade. Ash was taken up as rapidly as it could be got hold of, for interior trim especially. Practically all the ash to-day is going into the interior trim and apparently the good quality cannot be produced in sufficient quantity to keep pace with the demand.

The maple situation was also satisfactory during 1911. The implement trade of Canada was able to absorb all the maple produced, while the low end and thin stock was largely taken care of by the manufacturers of flooring.

The birch trade benefitted by the shortage of maple. The furniture business was able to take up a large portion of the stock of birch which offered and the shortage of maple resulted in a call from the implement manufacturers for birch, as a substitute. The implement manufacturers having tested birch for this purpose are now receiving it favorably and it seems likely to hold its position as an implement wood. Thin birch and low grade stock were sold up close, to the flooring manufacturers.

Taking the trade in hardwoods as a whole during the year 1911, it may be said that prices started out on a basis almost similar to that prevailing at the opening of the present year. The year started off with a stiff advance in prices which was rather difficult to maintain at first, but as time passed, the advance became permanent. It is quite likely that similar conditions will be repeated this year as indications are now strongly in favor of another advance.

## A Banker's Views on Lumber Situation

Sir Edmund Walker, President of Bank of Commerce,  
Denounces Dumping of U. S. Lumber into Canada

One of the most important pronouncements upon financial and commercial affairs in Canada is the address delivered each year at the annual meeting of the Canadian Bank of Commerce, by the President, Sir Edmund Walker. This address always covers a wide range of the important developments of the year and is acknowledged to be a careful and conservative estimate of the forces and events which have influenced the commercial and industrial history of the country. The lumbering industry always comes in for a share of the attention of the President and this year it occupied a larger space even than usual. This is accounted for by the critical nature of the circumstances which have affected the lumber industry and which have, in cases, been so drastic as to compel the attention of the banking world. It is significant to note that the feature which attracts the attention of the President of the Bank of Commerce most forcibly is the situation in the Canadian prairies from the dumping of United States lumber upon Canadian markets at prices which cannot possibly be duplicated without involving loss to the manufacturer and serious disturbance to the whole lumber trade.

#### United States Lumber Dumped Into Canada

Speaking of this feature of the case Sir Edmund Walker said:—"A year ago we stated that the immediate outlook for the sale of the lumber from the mountain mills was good, apart from the prospect of more dumping by United States manufacturers. Unfortunately, trade has continued to be bad in the United States, and great quantities of low-grade lumber have been sold in Canada at less than the cost of production. Some of this lumber is entered fraudulently, being billed as rough lumber or as surfaced only on one side, when it is actually lumber finished for the United States market and treated later so as to look like partly rough lumber. The mountain mills prepared for a heavy season, but their calculations were entirely upset by this state of affairs. Immediately south of British Columbia lies the greatest lumber-producing area in North America, and its natural output has been greatly increased by the necessity to cut over large areas in Idaho, Washington and Montana, where there have been extensive forest fires recently. If manufacturers there are pressed by their obligations and their bankers are less able

to take care of them than are Canadian banks to take care of their customers, the result is evident so long as Canada is a free dumping ground. Our manufacturers must pile up stocks which the banks must carry, or the cut of lumber in our mills must be curtailed and workmen be thrown out of employment in order that United States mills may be kept in operation. This winter, in any event, the cut will be reduced awaiting some adjustment of the situation. Mills more favorably situated as to freights than the mountain mills, but also depending on the prairie trade, have done well, despite a certain amount of loss from United States dumping. The coast lumbermen have suffered even more from this competition than the mountain lumbermen, both by dumping and by the loss of export trade, due to the United States manufacturers being willing to fill orders at less than cost. Shipments from Washington, the State which produces most lumber, to points in Canada from Winnipeg to the Pacific coast, are said to have increased from three to five times in volume since the depression in that country set in. The circular of the Secretary of the Canadian Lumbermen's Association issued in August last gives the following figures as the shipments of boards, deals, planks, joints and scantling for the years ending 30th June, 1909, 1910, 1911:

	1909	1910	1911
Ft. B.M. . . . .	127,099,000	189,193,000	403,285,000
Value . . . . .	\$3,317,000	\$5,163,477	\$9,266,275
Average price per 1000 ft. . . . .	26.09	27.23	22.97

The comparison of 1909 and 1911 for the nine months ending 30th September, as follows, is still more striking:

	1909	1911
Ft. B.M. . . . .	104,750,000	379,226,000
Value . . . . .	\$2,845,695	\$7,946,072
Average per 100 feet . . . . .	\$27.16	\$20.95

The increase between 1909 and 1911 for the nine months referred to is, therefore, nearly 275,000,000 feet, board measure, or 162 per cent., while the decrease in the average price is \$6.21 per 1,000 feet, board measure, or nearly 23 per cent. These figures apply to all Canada, but the conditions of the industry in British Columbia are much more worse than elsewhere. The average price received by British Columbia lumbermen is \$3 to \$4 per 1,000 feet less than the average for all Canada. Since the preparation of these figures we are told that larger quantities than ever are being dumped and that prices have declined still further. It does not appear that the consumer has benefited by this dumping, the profit apparently going to the middleman."

In connection with the above it is interesting to note what Sir Edmund Walker had to say about the lumber industry in the States of Washington and Oregon.

"The lumber business in the State of Washington," he said, "has been very unprofitable, partly because obligations resulting from the extensive speculation in timber lands in recent years, have left many manufacturers without the choice of curtailing their operations, and the hitherto sufficient eastern market has failed to absorb the output. The production of this State, which lies alongside British Columbia, has again been the largest of any State in the Union, amounting to 4,097,500,000 feet, worth about \$42,000,000, or, including shingles, about \$52,000,000. There has been a marked increase in shipping, and there are now five regular lines leaving Puget Sound. In the State of Oregon there was the same loss from overproduction as in Washington."

Speaking of the lumbering industry of the Prairie Provinces Sir Edmund Walker said: "The logging season of 1910-11 opened quite actively, and a large cut was made by most of the operators. The weather was satisfactory for the greater part of the winter, although towards the end of it the snowfall was heavy and interfered a little with getting the logs out of the woods. The big operator was able in the main not only to secure the logs of the year's cut but also draw out the logs of the previous season left in the woods owing to the early breaking up of the previous winter. In the spring the demand for lumber was general, satisfactory sales were made and prices continued good until June, when keen competition developed between the manufacturers of spruce and the coast and mountain mills. A large quantity of low grade stuff was also brought in from the United States. Favorable freight arrangements were also conceded by the railways to the coast and mountain mills. This concession, coupled with the cheap article from the United States, placed the manufacturer of spruce at a disadvantage and sales and profits alike were somewhat curtailed. Taken as a whole, however, both manufacturer and jobber have had a satisfactory year. The present season also promises to be an active one, and a large cut of logs is predicted."

#### Reduction in Ontario's Lumber Cut

The lumber trade in Ontario was referred to as follows: "The cut of lumber in the Ottawa Valley and in most districts in Ontario and Quebec will, because of low water, be slightly smaller than

for the previous year, and the cost of production will again be higher. Deals are all sold at higher prices, the market for high-grade white pine is good, while the common grades of lumber, which have been so difficult to sell since the depression of 1907 in the United States, are in better demand, although the cheap southern pine is still a menace to our product. In the United States and Canada the use of fireproof building material and of cement and iron generally in place of wood is growing rapidly. Already it is suggested that the United States has passed the highest point of per capita consumption of lumber. As yet, however, we use only a fractional amount of fireproof material as compared with an old-world country such as Germany. So that an important readjustment of our lumber requirements relatively to other things will gradually come about. This will certainly not lessen the necessity for conservation, but it may cause the punishment for our wastefulness to fall a trifle less heavily than we deserve."

In regard to the lumber trade of the Maritime Provinces Sir Edmund Walker said: "The year began favorably for lumbering operations, and the cut of logs was large, but owing to the drought a great portion of this did not reach the mills. There was a fair demand for deals at about last year's prices, but the Coronation, strikes in Great Britain and other causes interfered with trade. The markets in the United States and elsewhere were fair. High freight and scarcity of tonnage at the close of the season made it difficult to ship at a profit and large stocks will be carried over. For these reasons the cut of the ensuing season will be smaller."

#### The Consumer's Interest in Uniform Grading

North Bay, Jan. 11, 1912.

Editor Canada Lumberman:

In reading your pamphlet on "Grading and Inspection of Lumber," I was forcibly impressed by the fact that no reference is made to the consumer, who, after all, is probably most vitally interested in the standardization of grading and proper inspection of lumber. Speaking as a consumer, I would encourage you in your agitation. The standard specifications, under which other building and structural materials, such as structural steel, cement, and steel rails are sold, are the results of the co-operation of the manufacturers and consumers. In the United States, the American Railway Engineering Association, in co-operation with the Associated Bureau of Grades, the Northern Pine, the Yellow Pine and the Southern Cypress Manufacturers' Associations, has adopted a series of standard specifications for lumber. The conditions surrounding the Canadian lumber trade are such that these specifications are not entirely applicable to Canada, but I believe that through the co-operation of the various Canadian Lumber Manufacturing Associations and the various Engineering and Architectural Organizations, satisfactory grades and specifications could be established. If you think there is any possibility of all interests getting together, I would gladly endeavor to interest the Canadian Society of Civil Engineers in the subject.

Yours truly,

C. B. CLEMENT.

Chief Engineer and Superintendent of Maintenance,  
T. & N. O. Railway

Masham Mills, Que., Jan. 15, 1912.

Editor Canada Lumberman:

If a standard grading was adopted for the Ottawa Valley similar to the one agreed upon in the western part of Ontario, it would be of great advantage to both manufacturers and wholesalers.

Yours truly,

M. BERTRAND.

#### Box Lumber in Canada

The reported consumption of lumber for boxes and shooks in Canada during 1910 was over 158,000,000 feet, valued at \$2,273,000. These statistics have been compiled by the Forestry Branch of the Department of the Interior from reports received from 102 box factories, over one-half of which are in Quebec. Seventy million feet of lumber, or 15 per cent. of the total, was used in Quebec. Ontario used 60,000,000 feet, or 38 per cent. of the total, and the remainder was used in the provinces of New Brunswick, British Columbia, Manitoba and Nova Scotia. Pine, the chief species used in Ontario, formed 45 per cent. of the total box lumber, and cost only \$13.93 per thousand. This comparatively low price for pine, indicates that with this more than with any other species mill waste and cull lumber is being used in the manufacture of boxes. Spruce in 1910 was used in every province in which boxes were made, and formed 41 per cent. of the total. The cost was \$13.83 per thousand or 28 cents more than the average mill run price, so that manufacturers using spruce demand the finest quality. The remaining 14 per cent. of the total was comprised of 14 other woods,

# 1911 A Great Building Year in Canada

**Twenty-Two Leading Cities Expended About \$150,000,000—Proportionate Increase of 29 per cent.—Where the Money Was Spent**

The building record for the Dominion of Canada during 1911 showed a wonderful growth over the year 1910, which in itself has been a remarkable one in this regard. The twenty-two principal cities of the Dominion expended nearly one hundred and twenty million dollars on building during 1911, as will be seen by the accompanying table. The proportionate increase of the grand total for these cities over the preceding year was 29 per cent.

The greatest total spent upon building during the year was found in Toronto, where more than twenty-four million dollars were expended. An increase of 15 per cent. was shown over 1910. The greatest percentage increase was shown by Calgary, namely, 131 per cent. The stability of growth in Toronto is a remarkable feature. The increase for 1911 being practically the same as the increase for 1910 over 1909.

Vancouver came second in the list, having spent over seventeen million five hundred thousand upon building during the year, and Winnipeg was very close, being only one hundred thousand dollars less than Vancouver. Montreal came fourth on the list, so far as totals are concerned, but showed a decrease of six per cent. as compared with 1910. The returns secured from

Montreal, however, do not include the outlying portions. If Greater Montreal were all taken as one the total would be twenty-seven million five hundred thousand dollars. Regina was second in the list, as far as percentage increase was concerned, having advanced by 117 per cent. Saskatoon grew to the extent of 77 per cent., which was also the rate of progress at Victoria. Hamilton's total expenditure was \$4,255,730, an increase of 63 per cent. The heavy decrease in building at Ottawa which occurred during 1910 seems to have come to an end during 1911 when the total remained about stationary.

The total building expenditure in the Dominion of Canada for 1911 when compared with 1909 shows an increase of 82 per cent. Taking into account a number of smaller places which have not reported and also taking in the \$13,000,000 for Greater Montreal, a total of something in the neighborhood of \$150,000,000 is reached as a fairly accurate measure of the expenditure in Canada upon building during 1911.

The accompanying table gives an accurate idea of exactly where and to what extent the money was spent.

Town or City	Dec. 1910	Dec. 1911	12 mos., '10	12 mos., '11	Approx. Inc. per cent.
Toronto	\$1,353,265	\$1,791,032	\$21,127,783	\$24,374,539	15
Vancouver	958,775	1,592,485	13,150,365	17,652,642	34
Winnipeg	970,250	206,550	15,116,450	17,550,400	16
Montreal	756,800	622,422	15,715,859	14,759,632	6*
Calgary	354,300	698,160	5,589,549	12,908,638	131
Regina	20,625	71,230	2,351,238	5,099,340	117
Saskatoon	177,875	134,125	2,817,771	5,004,326	77
Hamilton	49,550	92,300	2,604,605	4,255,730	63
Victoria	131,750	242,350	2,273,045	4,026,315	77
Fort William	424,135	589,400	2,381,125	3,077,860	29
Ottawa	174,350	195,060	3,022,650	2,997,610	1*
St. Boniface	5,600	102,550	861,870	1,140,735	32
London	63,085	187,553	805,074	1,036,880	29
Lethbridge	35,450	112,750	1,211,310	1,033,380	15*
Sherbrooke	30,000	20,000	500,000	1,000,000	100
Windsor	22,700	81,150	392,040	739,515	89
Port Arthur	76,800	9,495	892,681	597,705	33*
Halifax	14,345	98,000	630,380	508,796	19*
Sydney	12,800	9,000	347,554	495,642	43
Strathcona	10,200	12,925	363,470	491,403	35
St. Thomas	10,150	2,100	286,400	285,575	—
Stratford	1,000	500	224,000	113,000	50*
Totals			\$92,665,219	\$119,149,663	

Proportionate increase on totals for above cities 29 per cent.

## Readjustment of Australian Duties on Timber

Under the Commonwealth tariff of 1910—and some preceding years—New Zealand white pine and Kauri pine were admitted at the rate of 6d. (12 cents) per 100 superficial feet in all sizes which very materially favored these woods as against Canadian spruce and Douglas fir. The alteration made was not all that could be desired from a Canadian point of view, but some benefit will be derived by timber exporters through the fact that New Zealand white pine only is to be admitted in future at the rate of 6d. per 100 superficial feet.

Mr. P. E. Heeney has left Montreal to open a hardwood lumber yard for the Glengarry Lumber Company, Berlin, Ont. Mr. Heeney was with Mr. Geo. Goodfellow, wholesale and retail lumber merchant, for eight years, first as cashier and later as general manager.

## Forestry Results in Europe

The productive forest area in 1908 on the Grand Duchy of Hesse in Europe amounted to 182,263 acres. In general the standing timber is composed of sixty-nine per cent. hard wood and thirty-one per cent. coniferous forest. The fir ranks first among the coniferous species. The total yield of lumber in 1908 was 4,575,000 cubic feet. Refuse in so far as it is not suitable for lighter lumber, such as

laths or for pulp, is used for firewood. The expenditures for salaries, forest cultivation and road building amounted to approximately \$754,000, and the total gross income (from lumber and firewood) was \$1,161,931. The capital represented by the forests (\$52,665,354) brought interest accordingly at 2.21 per cent. Where intensive forestry of this kind is practised, forest fires are unknown. Sufficient money similarly spent on Canadian forest reserves would greatly reduce the fire danger, maintain an adequate lumber supply for the country and in time become a source of revenue to the Government.

## General Lumber Advertising Campaign

A conference of the Board of Governors of the National Lumber Manufacturers' Association was held in Chicago recently, at which the principal subject discussed was the matter of advertising—a campaign for advertising wood, as against its substitutes. The advertising committee through its chairman Mr. A. T. Gerrans made a report upon the purpose of the proposed advertising and the plan which had been considered advisable. A resolution was passed instructing the advertising committee to proceed with the campaign, as soon as they found that a fund of \$100,000 for the first year had been subscribed. At the time of the meeting \$60,000 had been already pledged and the balance seemed assured within a few weeks.

# Lumber Trade of Ontario During 1912

Home Markets Continued Active Throughout Most of the Year—United States Demand Poor — Stocks Reduced and Cut Diminished — Outlook Good

The lumber industry in Ontario during the year 1911 was characterized principally by a steady demand and good prices for the local trade, but in connection with the export business a great deal was left to be desired. The export business with the United States was extremely dull and those who shipped to the old country found themselves handicapped seriously in the latter half of the year by the advance in freight rates on the transatlantic steamers and also by the extensive labor troubles in the old country which prevented importers in Great Britain from moving their lumber from the docks. This latter feature naturally resulted in a temporary lull in the exports from Ontario and other Canadian manufacturing districts.

It was expected, on account of these drawbacks that the total cut in Ontario would be considerably lessened. As a matter of fact the production of lumber in this province, during 1911 showed a decrease of about 30,000,000 feet, as compared with 1910. The total cut of the province during 1911 was close upon 950,000,000 feet and the cut of 1910 was nearly 980,000,000 feet.

## Volume of Trade Increased During 1911

Careful enquiries which have been made of the whole manufacturing trade in Ontario show that the volume of trade, during the year was materially increased, as compared with 1910. Very few mills report that the volume of their trade was less than in the previous year and by far the greater number state that their volume was in excess of that of 1910. A few of the mills report that their trade was just about the same in volume, as during the previous year. Considering the reduced output of the mills, together with the increased volume of trade, the natural conclusion is that the amount of stocks on hand at the end of the year were less than at the end of the year previous. This also turns out to be the case. Of the mills reporting practically two-thirds state that their stocks were less on Jan. 1, 1911, than they were on the corresponding date in 1910. The most important feature in connection with the reduction of stocks is that the trade during the year showed a much greater demand for the low end, than during former years, with the result that the heavy accumulation of low grade stocks which had piled up in the manufacturers' yards during the few years previous were largely worked off. The demand for the upper grades of lumber was not so strong, as for the lower end, but it was fairly satisfactory. As a result, the manufacturers are approaching the season of 1912 in a much better condition, than during a number of years previous. The experiences of the last few years moreover, have taught the whole trade a much needed lesson of caution and reports are almost unanimous that the cut of logs in the woods this year will be smaller, than it has been for a number of years past.

Under these conditions it is reasonable to expect that if the wonderful expansion of Canada continues during 1912, as it did during 1911, the lumber trade of Ontario will come through the year with a fairly satisfactory showing. It is not to be expected that the demand from the United States will improve during 1912, because the presidential election will take place during the fall and is certain to be a disturbing factor with the trade of the whole country.

The export trade with Great Britain is in a rather uncertain condition also, on account of the probable further increase in freight rates and on account of the continued unrest in labor circles. It is just as probable however, that the English market will show improvement, during 1912, as that it will show a decline. With a reasonable share of good fortune therefore, the manufacturing trade of Ontario may look forward to an excellent local demand and about an average export trade. With a curtailed cut and reduced stocks, it seems as though the lumber industry in this province during the coming season is likely to prove more successful, than during the past few years.

## Improvement Expected During 1912

That this is thought to be the case by the manufacturers themselves is strongly indicated by reports which have been received by the "Canada Lumberman." Over 75 per cent. of those reporting state that the outlook for 1912 is that trade will be good or that it will be considerably better than it was during 1911. Most of the remainder state that trade will be about the same as it was during 1911. One or two manufacturers report that the outlook is not encouraging. These few are confined to the North Shore of Georgian Bay, whose business is almost entirely with the United States and they naturally do not expect any improvement until political and

financial conditions in that country have taken a material change for the better.

In the matter of profits, 1911 was a very similar year to 1910. About 50 per cent. of the mills reporting state that their profits were the same in both years. 30 per cent. report an increase in profits on a proportional basis, some having increased their profits by about 7 per cent. One mill reports an increase of 25 per cent. Twenty per cent. of the mills report their profits reduced, during 1911.

Prices of lumber during 1911 in Ontario were as a rule either about the same as during 1910, or better. 50 per cent. of the mills report that they received prices higher than those of 1910. About 30 per cent. report similar prices. About 8 per cent. report reduced prices. The balance report fluctuating prices. Almost invariably the reports show better prices for the low grades and fair prices for the upper end. Several reports show better prices for hardwoods and for hemlock and Norway.

The majority of the mills report that conditions in the markets for lath were good. The opinion in regard to the shingle markets seems to be about divided, some reporting a good trade and others reporting dull trade. With a few exceptions those who export to the United States report that trade was dull. Those exporting to Great Britain report in the majority of cases, a fair trade. One or two report an improved trade and one or two report a similar trade to that of 1910.

The lumber, lath and shingle production of Ontario, during the year will be found in detail in the following tables.

## Georgian Bay and Northern Ontario Lumber Production

The lumber production in Northern Ontario, exclusive of the Ottawa Valley, was as follows, during 1911 and 1910:

	1911 Feet	1910 Feet
Burks Falls	3,500,000	3,200,000
Berlin	1,500,000	1,250,000
Berkeley	2,000,000	2,000,000
Blind River	32,000,000	51,000,000
Bruce Mines	1,500,000	5,000,000
Biscotasing	14,500,000	5,250,000
Bracebridge	11,763,000	14,000,000
Collins Inlet	5,425,000	4,600,000
Chatham	500,000	1,000,000
Collingwood	7,600,000	9,600,000
Cutler	27,500,675	38,833,065
Callander	11,878,000	7,900,000
Cache Bay	23,000,000	26,500,000
Chapleau		1,750,000
Dutton		400,000
Fesserton	3,000,000	1,300,000
French River		9,500,000
Fort Frances	31,384,282	2,500,000
Gravenhurst	30,000,000	30,000,000
Huntsville	12,250,000	11,600,000
Hepworth	2,100,000	2,000,000
Havelock	1,450,000	1,100,000
Hanover	4,000,000	4,500,000
John Island	13,000,000	13,000,000
Kinmount	2,500,000	3,000,000
Klock		2,500,000
Katrine	1,300,000	1,630,000
Kenora	18,000,000	
Kearney	1,700,000	1,000,000
Keewatin	25,000,000	30,000,000
Longford Mills	3,000,000	1,300,000
Lindsay	9,536,900	8,202,297
Lion's Head	3,077,421	3,200,000
Latchford	4,900,000	1,600,000
Lakefield	13,000,000	16,000,000

#### Georgian Bay and Northern Ontario Shingle Production

The shingle production in Ontario, exclusive of the Ottawa Valley, was as follows, during 1911 and 1910:

	1911.	1910.
Bridgenorth .....	.....	1,750,000
Bracebridge .....	2,601,000	3,400,000
Chesley .....	.....	200,000
Fesserton .....	1,500,000	1,000,000
Gravenhurst .....	10,000,000	10,000,000
Huntsville .....	.....	500,000
Hepworth .....	600,000	500,000
Kinmount .....	3,000,000	2,500,000
Klock .....	.....	500,000
Lindsay .....	10,543,750	9,593,000
Lion's Head .....	.....	300,000
Larchwood .....	1,250,000	900,000
Marmora .....	100,000	100,000
North Bay .....	3,750,000	3,500,000
New Liskeard .....	1,000,000	1,000,000
Owen Sound .....	1,500,000	3,250,000
Parry Sound .....	.....	3,000,000
Penetanguishene .....	520,000	500,000
Peterborough .....	7,200,000	9,000,000
Sault Ste. Marie .....	4,000,000	4,000,000
Shawanaga Mills .....	2,000,000	.....
Warton .....	.....	400,000
Other places .....	3,380,200	4,152,100
<b>Total .....</b>	<b>52,944,950</b>	<b>60,045,100</b>

Reforestation operations in the townships of Galway and Harvey, northern Peterborough, Ont., will be commenced next spring by Dr. B. E. Fernow, Dean of the Faculty of Forestry, of the University of Toronto, under instructions from the Dominion Government. The county of Hastings, Ont., is also undertaking reforestation of its waste lands.

The Ontario Government report of logs cut during the season of 1910-11 is as follows:

Pine .....	584,264,105 feet B.M.
Other logs and booms .....	93,464,161 feet B.M.
Railway ties .....	4,270,832
Cordwood .....	58,886 cords
Tanbark .....	16,570 cords
Pulpwood .....	90,726 cords

The area under license in the province is now 19,349 square miles.

The number of fire rangers employed in Ontario during 1911 was as follows:—Fire rangers on railways, 171; fire rangers on forest reserves, 190; fire rangers on other Crown Lands, 91; fire rangers on licensed lands, 413. Total, 865.

## Ottawa Valley Lumber Production

### Shortage of Water Power Lessened Output During the Autumn—Total cut Amounted to 521,000,000

Ottawa, Jan. 27, 1912.—The total lumber production of the Ottawa Valley for the year 1911 was over 521,000,000 feet. This means a decrease of over 62,000,000 feet from the output of 1911, which was over 583,000,000 feet.

The shortage may be accounted for principally by the low water, which affected nearly all of the larger firms, those farther up along the Ottawa river equally with Booth's in the city, and the mills just across the river. From about the 10th of October, Booth's were curtailed in their operations to half or less of their capacity. From a cut of 90,000,000 feet in 1910, they fell to approximately 80,000,000 feet. W. C. Edwards place their production last year at 75,000,000 feet, as against 80,000,000 feet the year previous.

The Shephard & Morse Co., Ottawa, have slightly less than 22,000,000 feet of an output, compared with about 29,000,000 feet in 1910. In the case of this and most other plants, the lath and shingle production is proportionately less than the preceding season. The James Davidson, Fort Coulonge and Ottawa, firm, through the regretted demise of their head, Controller Davidson, have been somewhat disorganized, and do not estimate the year's production. It is thought, however, that it will be about the same as the previous year, namely 8,000,000 feet.

Some of the mills farther down the Ottawa were seriously affected by the low water. The Hawkesbury Lumber Company's cut, for example, fell to two-thirds the previous year's. That is, 40,000,000 feet, as compared with 60,000,000 feet.

At least two very severe fires visited the Ottawa Valley trade during 1911. The Riordon Paper Company had almost their entire plant and stock burned in June. Their production last season was 13,470,200 feet, against over 20,000,000 during 1910. The R. and T. Ritchie Company, Aylmer, P.Q., whose cut advanced from 10,000,000 feet to 12,000,000 feet in 1911, had practically their whole stock, new and old, destroyed, some 15,000,000 feet.

The Pembroke Lumber Co., Pembroke, increased their cut from 12,000,000 feet in 1910 to 14,000,000 feet in 1911. The Colonial Lumber Company, of Pembroke, held their own despite the diminished water power, having the same output as in 1910, namely, 13,000,000 feet. The McLachlin Bros., Arnprior, whose power is derived from the splendid Madawaska river, cut approximately the same as the season before, 60,000,000 feet.

The Fraser firms, both Fraser & Co., and the newer concern, A. & F. Fraser, had somewhat reduced outputs, being respectively 11,500,000 feet—a quarter of a million less—and 2,500,000 feet—a million less than in 1910. M. N. Cummings, River Desert, reports 1,100,000 against 1,500,000 last year. Cameron & Co. cut 4,500,000, a decrease of half a million. Among the other firms the Rideau Lumber Company cut 4,000,000 feet, and doubled their shingle production, namely from 2,000,000 to 4,500,000.

The year has not been more than fairly satisfactory to most of the manufacturers. The cost of labor advanced, and even at the higher wages, Booth's for example, had difficulty in keeping their full complement of employees. At this firm, of course, the labor scarcity was first experienced as the plant is kept running night and day with different shifts. The curtailed production, taking the whole district into account, may help the prices to advance for the local trade. The cost of production, what with labor and other advances, is undoubtedly higher than the previous season.

The prices are better than for some time past, and the majority of lumbermen are optimistic that the present upward trend will continue. Particularly gratifying are the prices for the higher grades. The demand for white pine is good, and all the better classes are readily saleable.

For the lower grades not so much can be said, the year's trade having been dull and unsettled in these lines. A hopeful sign, however, is noted in the advance in box and mill culls during the past three months.

The export trade is regarded as in a more satisfactory condition than for a few years back. The British market has been steady right along, and still further advances are looked for.

"We can get about what we like for our best grades in Britain," stated one of the largest exporters. The export trade in deals, battens and boards to England has been very fair. Pine has been in good demand throughout the year.

The United States market is still far from satisfactory. Many dealers can see no likelihood of improvement in this direction, instancing the presidential elections as liable to postpone better trade conditions. The cheap Southern pine is a thorn in the flesh of the would-be Canadian exporter. The Riordon firm and some others, however, report an upward movement of late, and a better demand is predicted.

Most of the manufacturers have pretty well sold out their stocks. Mill culls in general have been cleared out.

The winter's logging activity would warrant the expectation of at least a normal cut next season. For several weeks it looked as though the firm would be unable to get out their regular quota of logs. The winter exceptionally mild and open up to New Year's, and it was feared logs felled by the army of shantymen—for twenty-five thousand w from Ottawa alone—could not be teamed out unless a good snow winter intervened. Fortunately this has happened, and while and other logging operations are considerably behind, the firm weather ever since the New Year has gone far to remedy will not be logging as much as usual this winter.

supply left over from the last cutting season, and this does not mean any curtailment in the coming summer. For the rest, the firms are working for a good year's business, and the outlook for 1912, so far as present conditions indicate, would justify a good degree of optimism.

Mining recorders, whose offices are in or near a forest reserve in Ontario, have been authorized to issue permits to prospect for minerals in those reserves. Under an order-in-council just passed by the Provincial Government, the regulations under the Forest Reserve Act are amended to permit of this change.

Krauss Bros. Lumber Co., New Orleans, La., recently remembered their friends in the trade, in a very practical manner by sending out a very useful automatic lead pencil having the appearance of a stylographic pen. This little souvenir is certain to be well liked by all who are fortunate enough to secure one.

Edward Hines Lumber Company, Chicago, Ill., have favored with a very practical calendar for 1912. A page is devoted to the company's plant and operations.

#### Cooperage Trade Had a Poor Year

By J. Innes, Chatham, Ont.

The year 1911 was not a very satisfactory one for the cooperage manufacturing industry in Canada, as the consumption in the early part of the season was small, while the annual consumption was fully up to the average of the past three years. Prices which were very low early in the year, hardly recovered themselves in time to be profitable to the manufacturers. The moderate apple crop, the unsettled conditions of business, owing to the elections, were also factors against fair prices for stock.

The output in Ontario during 1911 was approximately 54,000,000 elm and hardwood staves; 18,000,000 elm hoops; 3,500,000 set of heading; not including nail-keg stock, which would increase the output 8 per cent. to 10 per cent.

There was apparently a slight increase over last year's production in the Lower and Western Provinces.

While the consumption in some lines is decreasing, more especially in sugar barrels, it is being more than made up in packages for food products generally, as despite the higher cost than paper and jute bags, the advantages from a sanitary and safe delivery standpoint are so apparent to the consumers, that they demand the barrel in preference to any other package.

Take sugar for instance, by the time the odors from dirty railroad cars have been assimilated, and the handlers have got through with their hooks and many other influences have affected the contents, the packages arrive in anything but an appetizing condition to the consumer. The same applies to flour which is shipped long distances.

Apples packed in barrels arrive at destination unbruised, with packages unbroken, and it is impossible to find a box at moderate price which accomplishes the same results.

Salt, in barrels, arrives clean and dry,—lime, unslacked—crackers, clean and crisp;—and in fact no package is so universally desirable from all standpoints as the barrel, from a standpoint of strength, cleanliness, and cheapness.

The winter so far has been very unfavorable for stocking the mills, but there are still two months of winter to reckon on, so that by the time the mills are ready to start up in the spring, they may have fair stocks of logs to work on, and the production be up to the average.

In the meantime, prices for future delivery are above last year's basis. Unless an abnormally long winter ensues, they are not likely to be any lower than they are at present.

#### The Sash and Door Trade in Ontario

By F. W. Brennen, Hamilton, Ont.

The sash and door industry of Ontario, during the last few years, has, generally speaking, prospered. The raw material is becoming more difficult to procure every year, and consequently, is advancing in price all the time, and will continue to do so. This lumber is being shipped out of our country more each year, and our home consumption is increasing each year, so the door manufacturers must carry a larger supply of lumber all the time, for when he needs it, it is not to be had, if he does not procure it when available. The grade standard is lowering all the time. Good lumber brings a big price, and the door manufacturer is endeavoring to supply his demand. One way he has of accomplishing this is reducing the standard of the lumber grade, but the price, in spite of this, is steadily advancing. All these conditions have materially advanced the cost of the door manufacturing raw material. The cost of lumber has advanced easily five per cent. in the last year.

The labor item has also advanced, in cost, in many ways; the shorter hours, the Saturday half holiday, and a great many other incidentals that men ask for. The actual rate of wages has advanced in the last year easily five per cent., and whether we are getting more efficient mechanics is a question.

The demand in our trade is very good, and the actually busy portion of our trade is extending in duration of time. Formerly six months was the manufacturing season. Now we have ten months of good demand for our supplies. The great handicap to the industry is the production of stock during the quiet seasons. Manufacturers must get storehouse accommodation so that they can keep up the average output all the year around. The demand is increasing all the time, and the door makers will have to keep up with the trade and demand if they want to maintain it.

One feature of door-making that is noticeable is the demand for a higher grade door for interior finish. This has been the history in the United States, that a better door has taken the place of a cheap door. Our manufacturers will have to supply the demand.

Competition starts in this way, during the quiet season a general stir is made for orders, and usually the smaller manufacturers or weaker ones, start to cut prices in order to get trade, and the season is well on before this condition has been righted, but the manufacturers have had a better understanding with one another,

recently, and more confidence, and this feature has not been very marked.

The profits in door-making are very fair, when one understands his business fairly, or in other words, a profitable business can be conducted in making doors. But as in the case of the general farmer, everything must be made to count.

### Better Times in Store for Hemlock Trade

Editor Canada Lumberman:—The hemlock trade during 1911 saw the largest amount manufactured of any season in its history in Ontario, but along with this increased output was an increased demand which held the price about normal. Judging from this statement one would think the hemlock trade to be in quite a healthy condition, and that the manufacturer has little cause to complain; but on the other hand, it is quite to the contrary. Many evils have crept into the trade, among them one which has been hard fought during the past year, and last month the trade arrived at something like a victory when it adopted definite Rules of Inspection.

The grades of hemlock lumber during the season of 1911 were much raised. One stock with which the writer is familiar, had in 1911, 32 per cent. of No. 2 and lower grade against 27 per cent. of No. 2 and lower grade in 1910. If the Rules of Inspection, as adopted by the hemlock trade last December, are closely adhered to we should

eliminate this difficulty and place the trade on a much firmer foundation.

In the year 1907 the hemlock trade saw the price of hemlock lumber rise to the highest price yet attained, and naturally, along with the price of lumber rose the price of logs. Sad to say the price of lumber did not remain at the high point, but on the other hand the price of logs and standing timber stood firm, also the price of labor has steadily kept increasing, and the quality decreasing. Again, the price of food-stuffs has increased very much; it is needless for the writer to undertake to estimate the advance, as all in the trade know well about this particular end.

The increasing trade of Georgia pine, introduced by skilful advertising and not by the merits of the wood, has seriously affected the hemlock as well as other Canadian woods. Possibly the reader will think that the hemlock tradesman is of a dyspeptic nature and is given to fault-finding and complaining, but let me inform him that he is mistaken, for if he remains in the hemlock industry as it is to-day, he has to be made of the best material the country can produce, to battle with the difficulties which confront him. This has been clearly shown in their stick-to-it-iveness in dealing with the Rules of Inspection during 1911.

Now, if the hemlock trade will rally their forces and cling together in 1912, they will be able to crush out some of the evils which confront them, and make the coming season a profitable one.—Manufacturer.

# 1912 and 1911--Opinions of the Trade

Situation and Outlook Discussed by Lumbermen—Curtailement Probable in Ontario  
Hardwood Industry Expecting a Good Year — Retail Business Promising

Editor Canada Lumberman:

Sault Ste. Marie, Mich., Jan. 18, 1912

We think the cut of logs taken out the present winter on the North Shore will be considerably less than during the winter of 1910-11, possibly showing as much as 25 per cent. to 30 per cent. decrease. This will be partly the result of intentional curtailement from the beginning of the present logging season, on account of unsatisfactory market conditions, and partly because of the difficult weather and labor conditions for logging which prevailed during the fall and early winter. Labor was exceedingly scarce up to about November first; most camps we know of running up to that time with an average of not over 75 per cent. of the men they should have had. Labor then suddenly became rather plentiful but it was too late to make up very much lost time on cutting and skidding, particularly with an excessive amount of rain and snow in November and December, and companies which had reduced the number of camps found that the cut of each camp was also reduced from what they had figured on. The hauling weather has also been very unsatisfactory so far, as the frost came so late that hauling was about two weeks later than usual in getting started, and the intensely cold weather, when it did come, interfered more or less with all kinds of woods work.

Stocks of lumber in first hands in our immediate vicinity show a reduction from a year ago, but possibly total stocks on hand at the mills, both sold and unsold, show a slight increase, due to delays of navigation late in the fall.

From the point of view of the lumber manufacturer, conditions and profits during 1911 were even less satisfactory if possible, than the year before. Lumber sold at about the same price and about as freely, but a general increase in the cost of production served to cut profits a little further. Our collections were quite good nearly all season, although late in the fall they seemed to slow up a little for some reason we cannot explain.

The North Shore lumber operators have been, for the last two seasons, laboring under a rather unusual, and very disadvantageous condition. That is, they have been producing lumber in a very prosperous country with corresponding scarcity and high cost of labor and many supplies, and selling it in a country where business conditions have been considerably depressed. The marketing of so large a proportion of the North Shore lumber in the United States in spite of unsatisfactory market conditions there, is due apparently to the fact that Central and Eastern Canada has a considerable exportable surplus of pine every year, and that owing to good cargo rates from the North Shore to United States markets, and rather high rail rates to Canadian consuming points, the North Shore furnishes more than the average proportion of the exported pine. This United States trade, which is primarily a question of transportation, will probably exist as long as the present transportation conditions exist, as the duty of \$1.25 per M. is the equivalent of only about five cents per hundred pounds freight on rough White Pine, and four cents per hundred on rough Norway.

We can see no great encouragement for the Ontario lumber manufacturer until one or both of the following changes comes: either a let-up in the present excessive expansion in Canada, particularly in railway construction, which while it lasts makes the cost of both labor

and supplies abnormally high; or a considerable improvement in the industrial conditions of the United States. The former will probably not come for several years, or until the present cycle of railway, industrial and land speculation has passed, but it is certain to come. The probabilities are that the latter will not materialize in any considerable degree until about another year and that the curtailement in production this season should prove not only beneficial, but quite necessary.

Very truly yours,

WOLVERINE CEDAR & LUMBER CO.

1912 a Good Year to Play Safe

Toronto, Ont., January 6th, 1912.

Editor Canada Lumberman:

As near as we can find out the output of logs this year will be forty per cent less than in 1911. The available stocks are about the same as a year ago. The mild weather has made logging conditions very difficult and expensive.

There was about the same quantity of lumber manufactured in 1911 as in 1910, but the prices were not as good, and the logging conditions were much more difficult than in 1910 owing to deep snow, thin ice, and soft marshes, which brought the manufacturers' profits down, in many instances, to the microscopic point. Collections were quite satisfactory.

The market of 1911 was materially affected by the uncertainty of the tariff relations between Canada and the United States, and the Presidential election coming on this year further retards commerce in the United States. Our commercial affairs are very sympathetic with theirs, and anything affecting them affects us to a degree.

This, we think, is a good year for the lumberman to play a safe game by not overloading, as the conditions in Western Canada are far from flourishing. This, combined with the unsatisfactory conditions in the United States, is our reason for the warning.

During 1911 the Canadian markets suffered greatly from the enormous imports of southern pine from the United States, which enters Canada free of duty when planed one side only. This lumber undersold several important lines of Canadian lumber and threatens to become a great menace to Canadian trade unless a duty is placed on rough lumber.

Yours truly,

THE PARRY SOUND LUMBER COMPANY, LIMITED.

A Good Year's Trade at Hamilton

Hamilton, January 11, 1912.

Editor Canada Lumberman:

That the past year has been a particularly good one for those engaged in the supply of building material, we think is the general opinion of those interested, and here there is every indication of a repetition of the conditions during the coming summer. Prices have been fair, and cutting to get business has been pretty well eliminated. There has been a large amount of speculative house building here. The grade of lumber used in this class has been poor, and the prices on these lines have been cut pretty close; but on the whole there have been fair margins. The labor market has been fairly satisfactory with a slight advance on last year, but with the same dearth of good mechanics. The class of building is changing for the better, but the change to special designs and different woods and natural finish, certainly furnishes the equivalent in worries for any additional return there is in it.

Reinforced concrete construction has been quite a feature of the building trade here lately, and is apparently growing in favor, but unless the system of false work is materially changed, the lumber dealer need not lose any sleep about the loss of business, as with the present methods of construction there is often as much or more lumber used for this purpose than in the old style of permanent construction. The slow-burning construction certainly used a much larger amount, but this style is not used to the extent it was, and cement and steel are gradually crowding it to the wall.

Contractors have, on the whole, been getting very fair prices for their work with a few exceptions, and the amount of work offering at all times left no excuse for figuring below a fair margin.

The cost of lumber in the lower qualities has been practically the same in 1910, but the piling of grades has been in evidence as usual in the better class, and this, with some slight advances in price, go to make these lines pretty dear. In fact when you come to the stock used in natural finish pine doors, it is a toss-up which is the best value, the white pine of the north, or Carolina sugar pine with a twenty dollar freight. Another knock for the saw mill man while the opportunity offers; why cut such a large percentage of red pine into 18 ft. lengths, and compel us to stock up with yellow pine in short lengths, to fill orders for joisting, etc., and then denounce the importation of yellow pine?

On the whole the supply man has had a very good season in Hamilton and would probably get something out of the business if he could devote a little more time to it instead of to those smooth gentlemen of the grip.

Yours truly,

THE PATTERSON-TILLEY CO.

#### Hardwood Prices Likely to Advance

Hanover, Ont., January 6, 1912.

Editor Canada Lumberman:

We are not in the lumber business in the ordinary sense but we are constantly in contact with saw mill men, not in any particular locality but over a large portion of Ontario. Up to this date there are practically no logs hauled, and cutting has been stopped in a great many cases, because people do not care to cut more hardwood timber than they are reasonably sure of being able to deliver at the mills. Generally speaking the cut of hardwood so far exceeds that of last year.

The stock of dry lumber on hand with both producer and consumer is decidedly lower now than it was a year ago.

No hauling as yet has been done worth speaking of because there has not been enough snow.

As far as we know, the collections for hardwood sales have been good. The principal difficulty in the hardwood business, is now, and always has been, the want of uniform rules for inspection. We have adopted our own rules and presume that a great many other consumers have done the same. Others who have not done so have been at the mercy of the "scalpers." We have printed on a margin of our ordinary letter heads a rule of inspection, and invariably apply it on all lumber we buy. We have no trouble to buy all our requirements direct from mills.

Nobody can tell at this time what his logs are going to cost him because they are not delivered, and the cost of delivery depends entirely upon the weather conditions. However, we do not look for any fall in prices of hardwood. The chances are they will go up.

Yours truly,

THE KNECHTEL FURNITURE CO. LTD.

#### Improvement In Hardwood Prospects

Marmora, Ont., January 17th, 1912.

Editor Canada Lumberman:

As far as we can judge at the present time the year 1912 is likely to prove quite as good as 1911. In fact the hardwood market is now exhibiting an improvement and we are already in receipt of many enquiries and offers for our entire cut.

Weather conditions for work in the woods were not ideal, owing to lack of frost before Xmas, which made it impossible to get into the swamps until after the New Year. During the past ten days we have had very heavy falls of snow and very little more will increase the cost and difficulties of drawing considerably. Supplies for camps keep climbing up in cost. There seems to be a fair supply of labor although it is becoming increasingly difficult to secure first-class woodsmen.

Stocks of lumber hereabouts are pretty well cleaned out. Our own is about the same as a year ago.

Yours truly,

THE PEARCE COMPANY, LIMITED.

#### Reduced Operations at Owen Sound

An Owen Sound firm of manufacturers write as follows:

Owen Sound, Ont., January 15, 1912.

Editor Canada Lumberman:

As far as we can learn the stocks around here, on hand at the present time, are about the same as last year, and while the fall was very wet, still, since the cold weather set in, there is a better outlook for the woods operations and the hauling is now in full swing.

Our sales and collections for 1911 compare very favorably with 1910, in fact the demand for red pine, in sales, was considerably in excess of 1910, and from indications at the present time, we are looking forward to a very good season's work during the coming year.

The quantity of logs to be taken out this year we do not think will be as great as last year by about 25 per cent.

#### Increased Cost of Labor and Materials

W. D. Cargill, of Cargill, Ont., writes as follows regarding the planing mill industry:

Cargill, Ont., January 16th, 1912.

Lumber used in 1911 cost us about \$3.25 per M. more than in 1910. Labor cost three per cent. more. Demand was very slow during the first four months of the year, but was good during the balance. Competition was too

keen, causing cutting of prices which the small margin of profit could not possibly warrant.

Profits were very small indeed, notwithstanding that we sold throughout the year at Association prices; the lessened production and smaller output having to carry the same overhead and running expense. This applies solely to our plant here.

#### Uniformity of Grading Greatly Needed

St. Anns, Ont., January 10, 1912.

Editor Canada Lumberman:

I have had a very good year in my lumber trade during 1911 and am hopeful for the year 1912. Profits have compared favorably with other years. My sales were better than during the previous year. Labor is becoming more expensive. My stock of timber is about 500,000 ft. House finishing has been in good demand. Collections were about on the average. The most trouble I have is to get the lumber as good as the salesman represents it. Uniform grading of lumber is what is wanting. Every grade should be defined so that there cannot be any dispute. This would benefit both wholesalers and retailers.

Yours truly,

WILLIAM MICHENER.

#### Profits for 1911 About an Average

St. Catharines, Ont., January 19th, 1912.

Editor Canada Lumberman:

The profits for 1911 were just about the same as in former years, but we had more business and handled considerable more lumber than any previous year. The cost of this business has increased considerably. Labor has been more expensive and our stocks are larger than formerly. We find that there is an increased demand for hemlock and spruce; the white pine being slower. Collections have been just about an average. We are expecting that 1912 will be fully as good as 1911.

Yours truly,

HENRY WISE

#### Scarcity of Labor Was Serious Handicap

The J. & J. Kerr Company, Limited, Petrolia, Ont., retail lumber dealers, report that during the year 1911 profits in the retail trade were about at an average, although the extent of the year's business was hardly up to that of former years. The cost of conducting business was increased. Stocks on hand at the close of the year were lighter than they were a year previous. The best demand for the year was for spruce and hemlock. Collections were about on an average. The worst handicap was the scarcity of labor. The cost of labor increased. The skill of the workmen was not as high as in former years and the number of workmen available showed a considerable decrease.

#### Good Retail Trade Expected This Year

McLellan & Company, retail lumber dealers, Bowmanville, Ont., report that profits for the year 1911 were about the same as they were during 1910. More business offered, but the cost of operation increased. Labor was far more expensive. Their stocks of lumber at the close of the year 1911 were larger than usual, as they expect to do a much increased business this spring. The best demand during 1911 was for the low grades, while clear white pine lines were slow. Collections were not so good as they were in 1910. They consider the prospects for 1912 trade better than they ever were before, as houses are very scarce.

#### Profits Better, Collections Worse

Knight Brothers, Burk's Falls, Ont., report that they expect the output of logs this winter to be about the same as last year. Stocks of lumber on hand to-day are a little smaller than they were a year ago. The woods operations were favored with good weather for cutting and skidding up to January 1st, and plenty of snow fell then for hauling operations. The sales of lumber stocks for the year were greater than for the year previous and profits were a little better, but collections were worse. They experienced throughout the past year a decided want of steady efficient labor. The indications, they report, are for fairly good business during 1912.

#### Had a Good Year and Expect a Better One

Pembroke, January 9, 1912.

Editor Canada Lumberman:

As far as we are concerned the business for 1911 was much better than for 1910. The quantity of unsold lumber was much less at the close of 1911 than a year previous. The prices were much better all around. As regards the outlook for business for 1912, we expect to get better prices than during 1911; in fact anything we have sold has been at an increase in price.

Yours truly,

THE COLONIAL LUMBER CO. LTD.

#### Had a Good Year at Lindsay

Lindsay, Ont., January 9th, 1912.

Editor Canada Lumberman:

We will take out as many logs this season as last year. Stocks are a little higher than last year. The weather conditions so far have been bad but the outlook for hauling is very fair. We consider that the year 1911 was a great deal better than 1910.

THE JOHN CAREW LUMBER COMPANY.

Messrs. R. and T. Ritchie, Ltd., Aylmer, Que., report that they "consider the outlook for business for 1912 very good."

## Good Year for Machinery Trade

Manufacturers of saw mill and wood-working machinery had an excellent year in Canada during 1911, as will be seen by reading the following letters received from several of the leading firms:

Peterborough, January 5, 1912.

Editor Canada Lumberman:

We are pleased to be able to state that during 1911 we were extremely busy and our sales for the past year were considerably larger than in previous years.

So far as 1912 is concerned, we can see nothing in the outlook at this time to cause any uneasiness, and we are confidently looking for an even better year in 1912 than we had in 1911.

Yours truly,  
WILLIAM HAMILTON COMPANY, Limited.

### Good Prospects for 1912

Brantford, January 6, 1912.

Editor Canada Lumberman:

We have no reason to complain of business in 1911, though the prices were somewhat lower than in 1910.

As far as we can judge, prospects for the year 1912 are good.

Yours very truly,  
THE WATEROUS ENGINE WORKS CO. LTD.

### The Best is Still to Come

One of the largest Canadian manufacturers of saw mill and wood-working machinery writes as follows:

Hamilton, January 8, 1912.

Editor Canada Lumberman:

Business for 1911 was in fair volume, it being however visibly affected by the election issue, "Reciprocity," and more particularly so at election time.

There was a considerable volume of business offered and closed directly after the election.

It is a little early in the year to draw any conclusion for 1912 but from what we have from the reports of our men from the different districts of the Dominion, everything appears very favorable and there are indications of a large volume of business offering.

This country is particularly affected by the crop conditions and with the opening up of spring, if there should be a good indication of crops, we cannot but see that Canada will enjoy the best year she has yet had.

### Nothing But Prosperity Ahead

Montreal, Que., January 8, 1912.

Editor Canada Lumberman:

The year 1911 saw the best year's business we have ever had, particularly in the equipment of smaller plants in the new towns throughout the country.

There is nothing on the horizon to indicate anything but an increase in prosperity for 1912.

Yours truly,  
THE CANADIAN FAIRBANKS-MORSE CO. LTD.

### Business Increased Over Sixty Per Cent.

Orillia, Ont. January 10, 1912.

Editor Canada Lumberman:

We are pleased to state that as far as we were concerned, our business in 1911 was entirely satisfactory in every respect. We increased our business over 1910 by over 60 per cent., which expresses the condition of business better than any other remarks we might make.

The outlook for 1912 is very bright, and while, of course, it is impossible to tell what the future may bring forth, we have every reason to believe that the year 1912 will be even better than 1911.

Yours very truly,  
THE E. LONG MANUFACTURING CO. LTD.

### Calendars for 1912

The Newman Machine Co., of Greensboro, N. C., U. S. A., well-known manufacturers of woodworking machinery, have issued an attractive calendar for 1912, which is illustrated with a view of the company's plant and pictures of several of their machines.

Wistar, Underhill & Nixon, wholesale lumber dealers, Philadelphia, Pa., have sent out a very practical and attractively gotten up calendar for the current year. The large date pad contains one sheet for each week, subdivided into sections for each of the business days, with plenty of blank space for the entry of memoranda. The pad is mounted on an attractive green cardboard with white border.

The Wood-Mosaic Co., Inc., New Albany, Indiana, manufacturers and wholesalers of hardwood, lumber and flooring, have sent out a very attractive calendar for the current year to their friends. In addition to a neatly printed date pad, the calendar is rendered attractive by a splendid colored reproduction of a painting by Philip R. Goodwin, entitled "Cruisers Making a Portage." The painting is one which will appeal especially to all who are interested in the lumber business as it shows a couple of cruisers at one of the most interesting and most trying of their lonely trips through the forests.

### Leonard Bronson on the United States Trade

In the course of his annual review of the lumber trade situation, Manager Leonard Bronson of the National Lumber Manufacturers' Association, says:

"The lumber business of the United States has been in a demoralized and generally unsatisfactory condition during 1911. There was some slight improvement in some sections over the condition of 1910, but there continued

unprofitable business as to most of the industry and particularly in the major woods, like fir, yellow pine, spruce and hemlock, which, in many sections of large production, have sold at or below cost of production. The exceptions to the unsatisfactory condition are found chiefly in the hardwoods, some of which, never in full supply, were moved at good prices. Such were particularly oak of the better grades and poplar. The latter is one of the leading automobile materials and is one of the eastern woods which is obtainable in wide widths and of first quality, although only in limited quantity.

Improvements were seen in some yellow pine lines. The year opened very badly everywhere in the yellow pine country, but the producers of this class of material along the South Atlantic Coast from Virginia to Florida witnessed a pronounced improvement. The yellow pine business of the South also showed a decided improvement early in the year over 1910. The advances during the first few months of \$2 in prices led to excessive competition from the effects of which they were saved only by curtailment of product. The close of the year sees the lumber industry in better statistical position than at its beginning and coupled with this fact is the promise of a better demand for 1912.

## Exports of Forest Products to U. S.

### Total Value Nearly \$29,000,000—Lumber Sent Across the Border Decreased By Over \$3,000,000—Three Years' Details

The following table shows the values of exports of forest products from Canada to the United States during 1911 and the two preceding years:

Classes—	1909	1910	1911
Totals ... ..	\$26,421,373	\$31,835,326	\$28,785,427
Ashes, pot and pearl ... ..	1,166	820	604
Ashes, other... ..	58,269	61,898	61,120
Total ashes ... ..	59,435	62,718	61,724

The imports of sawed rough lumber at Buffalo, N.Y., from Canada for the past year show a decrease of 27,104,947 feet compared with the previous year. The figures for 1911 were 40,777,639 feet, with a value of \$792,406. The imports of such lumber have shown great variation in quantity within the past ten years, having been larger in 1902 than in any year since that time. They were then more than double the imports of the past year.

# Imports Into United Kingdom Decrease

**Smaller Quantity of Sawn and Planed Wood Purchased from Abroad—  
Russia Leads Exporters to the Old Country—Canada in Third Place**

The importations of sawn and planed wood into the United Kingdom during the year 1911 showed a decrease as compared with the year 1910 and were slightly less than those of the year 1909. According to the Board of Trade returns, the quantity of sawn and planed wood imported during 1911 was 5,572,260 loads, as compared with 5,993,629 loads in 1910 and 5,722,081 loads in 1909. The values of these importations were as follows:—1911, £15,963,977; 1910, £17,009,189; 1909, £15,469,855. The imports from Canada during 1911 totalled 998,167 loads valued at £2,949,706. In 1910 the total was 1,105,545 loads valued at £3,237,588. The total for 1909 was almost the same as for 1910. During 1911 the largest importations were as usual from Russia, totalling 2,646,560 loads. This however, was a slight decrease from the total of 1910. The imports from Sweden were second in the list, the total being 1,101,359 loads which also was a decrease, as compared with 1910. Canada occupied the third place in the list and was followed by the United States with 412,404 loads, and Norway with 308,688 loads. Other countries made up a total of 105,102 loads.

## Influences Which Affected Lumber Trade

Messrs. Foy, Morgan & Co., in their annual report upon the wood trade say:

The importation of sawn and planed wood goods into the United Kingdom has fallen away considerably during the past year, not merely in comparison with the two preceding years, or even with an average of the previous five years, for which statistics are given and on which the decrease amounts to at least seven per cent., but on a wider survey is found to have been by far the smallest recorded during any of the previous years, with the single exception of 1908. For this result there have been many contributing causes, among the chief of which, the increasing international competition for all kinds of raw materials and the resulting high average cost combined with a low consumption, for which the depression in the building trade is mainly responsible, are at all events not peculiar to the past year, although their influences seem to have been more acutely felt. But in addition to these, the trade has recently had to confront special and unforeseen difficulties such as the dislocation of trade through the protracted series of labor troubles causing a further restriction in normal consumption, and secondly, the great increase in freights leading directly to an increase in the cost, and eventually curtailing the volume of supplies. These undoubtedly have been the crucial factors in determining the restricted and unprofitable character of the past season's business. The average import cost remains at the high level attained in 1910, which would be remarkable, in view of the admittedly reduced consumption during the past year, except for the fact that the reduction in the supply has more than kept pace with the retrograde movement of the demand, with this result, however, that the ratio between the two is probably more favorable to a steady market during the present closure of the navigation than could have been said to be the case a year ago.

The latest returns of the general trade of the country are, however, so encouraging, that an extended inquiry for wood may be fairly anticipated in the near future. Indeed, many of the wood-using trades, e.g., box-making, furniture, and particularly ship-building, are reported to be busy; but no really wholesome impetus in consumption will be forthcoming (without which there can be no great increase in turnover, which is now the great desideratum from the timber-merchant's point of view) until the belated improvement in the building trade has actually taken place. The best indications of such a consummation, although these cannot be accepted as conclusive, are found in the reports by the Board of Trade, showing that the number now unemployed in the building trade is only one-third of what it was a year ago, and still less than two years ago. Some speeding up of the consuming power of the U. K. markets in the interval between the present and next midsummer would appear to be a matter almost of necessity if the increased supplies during the coming year, prophesied by some as the consequence of hanging over a portion of the past season's manufacture, are to be absorbed without jeopardy to prices.

The predominant position of Russia as the chief source of the wood supplies of this country remains relatively unimpaired, the proportionate contribution being 47 per cent. from Russia, 25 per cent. from Scandinavia, and 26 per cent. from Canada and U. S. A., or almost exactly the position reached in 1910. The quantity received from Russia shows, indeed, an actual reduction of 45,000 standards in comparison with the previous year, but this is only proportionate to the shrinkage in the total volume of the present supplies, and scarcely disturbs the general tendency, whereby Russian productions have been gradually supplanting other varieties. It will be noticed in this connection that the imports from Russia are still eight per cent. above, while the remainder of the imports are more than fifteen per cent. below the averages respectively of the previous five years.

The lot of the importer has been unusually harassing during the past season, especially for those who hesitated to cover their tonnage requirements by paying the slight increase in freight rates which was at first demanded by shipowners. In the majority of cases, chartering was postponed until a considerable slice of the ordinary importing profit had been consumed by the rise in freights which immediately followed the seamen's strike, while those who delayed still longer had not only to stand the racket of a constantly stiffening freight market, but in many cases suffered through having their deliveries impeded, and even the goods themselves spoiled, by the disturbance to business, consequent on the dock-laborers, the lighterman's

and the railway strikes. So far as the large ports of the Kingdom are concerned, this train of circumstances accounts for the retarded arrival, and ultimately for the diminution in the total volume of the supplies, inasmuch as the activity displayed in the shipment of goods during October and later could never compensate for the spoiled opportunities.

## Trade in Canadian Woods

Regarding the United Kingdom trade in Canadian wood goods Messrs. Foy, Morgan & Company report as follows:—

**Pine.**—The trade has been quiet throughout the season, prices in this country remaining firm owing to the shortage of supplies, the increased prices charged by the lumbermen in Canada and the rise in freights. Prices, c.i.f., have ruled for 3 x 11-inch £35, £24, £15 15s., and for 3 x 7/10-inch £25 10s., £17 10s., £13 10s., for 1sts, 2nds and 3rds respectively.

**Spruce.**—Prices for Quebec shipments have undergone little change during the season, starting and finishing on the basis of £9 12s. 6d. for 3 x 9-in. and £8 5s. for 3 x 7/8-inch 3rd quality. The state of the freight market, especially for tramp steamers, has restricted business, and the loss entailed on shippers thereby has been considerable. The prices of Lower Port shipments declined to a considerable extent during the summer under the stress of competition with Riga goods, but recovered almost entirely during the autumn owing to the cessation of supply brought about by the prohibitive rates demanded for tonnage.

The following diagrams showing the periodical estimates of the duration of supply, in comparison with the averages of the same, at the same time in the previous five years, are based on the monthly statistics issued by Foy, Morgan & Company, London.

Canadian Pine

Canadian Spruce

## Reduced Imports of Pine Deals at London

Messrs. Churchill and Sim, London, Eng., in their annual wood circular deal with London's trade in Canadian woods as follows:—

The importation of pine deals into London during 1911 is probably the smallest ever known, and is reminiscent of the prophecies of many years ago, according to which the importation of those deals and of all other wood from Canada should have ceased from exhaustion about 1880. The prices current for them now were certainly undreamed of then; they have become a luxury, and as such can be sold in small quantities at whatever rates may be necessary. It is a good old-fashioned trade, demanding and rewarding capital, very free from competition, but becoming year by year smaller in volume. It is also absolutely dependent on an unvarying adherence to the full standard of quality. The spruce deal trade must almost now be divided into two parts, that from the St. Lawrence and that from the Lower Ports of New Brunswick, etc. The former market follows in a measure on the same lines as that for pine. The deals are of a higher class, fitted for much of the better sort of work for which whitewood is used, and in their way costly. The latter characteristic is militating against them severely, and they too are being driven out of wholesale trade. The importation in 1911 was less than half of what it was only seven years ago. The importation from the lower ports holds its own much better, but it also has its troubles in the competition which has risen up against it in recent years from the increasing flood of cheap Riga white wood. But for this the trade in lower

port spruce, especially in London, would have been far larger than it now is. It would have taken to itself all the demand consequent on the ever-enduring struggle for cheapness for which it is now being beaten by the lower qualities of Riga white, which not only cut under it in price but are coming to be preferred to it in usefulness. The importation for 1911 has been moderate, smaller than 1910, but about equal to that of 1908 and 1909. The stock remaining in the docks is quite a moderate one, and should show some profit to holders during the winter. Of the other Canadian woods, yellow and red pine timber may pretty well be eliminated from the list of marketable articles in London; and of the hardwoods, ash, hickory, oak, alar, and Nova Scotian birch timber, may now fairly follow suit. There is still a fairly large wholesale trade done in Canadian elm timber in London. The importation during 1911 has been quite considerable, but it requires to be held for demand which is slower than might be. There is still also a good trade in birch timber from Quebec, it is of fine quality, or should be, and has been in good demand throughout the past season. The large trade now carried on in birch planks draws its supplies from all parts of Canada. The course of prices has been forced up during 1911 by the rise in freightage, etc., but the demand has been checked in consequence. Nevertheless the large stock in the docks in London should be good holding.

### London Imports of Canadian Woods

Importations of Canadian wood into London during 1910 and recent previous years was as follows:—

St. Lawrence—	Pieces.	Pieces.	Pieces.	Pieces.	Pieces.
	1907	1908.	1909.	1910.	1911.
Pine deals, etc. ....	801,000	521,000	612,000	563,000	400,000
Spruce deals, etc. ....	1,081,000	815,000	857,000	969,000	970,000
Birch deals, etc. ....	318,000	208,000	243,000	283,000	320,000

## Glasgow Trade Enjoyed Good Year

Activity in Shipbuilding Industry Counteracted Depression in Other Lines—Prices Well Maintained—Outlook Promising

The lumber trade at Glasgow during 1911 is reviewed by Messrs. Edmiston & Mitchells in their yearly timber circular as follows:—

The opening of the year found trading conditions in this market rather unsatisfactory, and certainly much short of expectations, but during the latter months a decidedly better tone began to be manifested, and business gradually assumed a more healthy appearance. The shipbuilding industry once again proved the mainstay of the trade, the consumption in this direction having been very satisfactory, and served to partly recompense for the shortcomings of the demand from other sources. Indeed, it may be said from the outset that but for the fact that shipbuilding was booming, the timber trade would assuredly have been in a sorry plight, as comparative stagnation must have prevailed. As it is, however, the overhead consumption, while still well under the average of the last dozen years, compares quite favorably with the preceding year or two, which always affords some little consolation. In this connection, a feature of outstanding interest was the inauguration during the year of direct imports from Riga, shipments to the extent of about 6,000 standards having come forward, and the competition with American spruce from this source has in consequence been greater than ever, and shows prospects of becoming more acute.

In view of the general state of trade, it was not altogether surprising to find speculative dealing non-existent, consumers restricting their purchases for the most part to the covering of immediate requirements only.

One feature that gives much cause for gratification is, that notwithstanding the long spell of depression the market has experienced, it has emerged with practically a clean slate so far as monetary troubles are concerned, no failures of any importance having occurred.

Values, with few exceptions, were maintained on a decidedly firm basis, and have latterly developed an advancing tendency in sympathy with the appreciation in freights, while the shortage of the available supplies in some instances has also been responsible for the upward movement. That the imports throughout the year were kept within moderate compass, with a consequent limitation of yarded stocks, was in some measure a strong factor in the maintenance of values.

As regards the local wood-consuming industries, shipbuilding, as already indicated, has been very busy, the output for the twelve months constituting a new record, and prospects for the ensuing year are excellent. Housebuilding continues stagnant, and, unfortunately, holds out little hope of early revival, while the cabinetmaking trade has also suffered more or less from dullness. Boxmakers were moderately well employed, but the joinery trade was extremely quiet. Railway carriage and wagon building has shown a very welcome improvement of late, in consequence of which the local railway companies have made their presence felt in the market to a larger extent than for a long time.

The trade has been wonderfully free from internal labor disputes of a serious character, which is all the more remarkable in face of the great unrest that has permeated the labor world generally. It is true that work at the local docks was suspended for some time, but apart from the fact that delivery of goods ex ship was somewhat retarded, the dislocation of business was not very serious.

With regard to prospects for the coming year, there is a natural hesitancy to prophesy in view of the previous disappointments when optimism seemed

justifiable; but it may be said that indications at the present time point to the likelihood of trade being at least maintained as it is at present, and afford a reasonable hope of material improvement.

The Clyde shipbuilding returns for the year are of a highly satisfactory nature, showing, as they do, that all previous outputs have been easily eclipsed and a new record created. The total output for this and the two preceding years is as follows: 1911, 392 vessels, aggregating 632,872 tons; 1910, 350 vessels, aggregating 390,000 tons; 1909, 320 vessels, aggregating 405,000 tons. In the previous record year of 1907, the tonnage launched amounted to about 620,000 tons. A further source of satisfaction lies in the fact that there is still a large amount of work on hand, and the prospects for the coming year are thoroughly reassuring.

### Imports from British North America

Yellow pine logs.—In spite of many attempts at substitution, this old-time favorite still maintains its prestige, although the limited quantity available and consequent enhanced values naturally entails restriction in the consumption. The boom in shipbuilding gave rise to a good demand for deck-wood sizes; in fact, practically the whole movement is traceable to this source, and it has been found impossible to meet the requirements for such. The import and consumption were similar to last year, but we are left with the very light stock of 846 loads. Values have kept extremely firm with an advancing tendency. Little further has been heard of Siberian pine, and the problem of finding a suitable substitute for the Canadian variety would appear to be no nearer a solution.

Elm logs.—The supplies which came forward during the year proved quite insufficient to cover the market wants, and the available stocks were quickly absorbed. Large average wood in particular was in good request, and some fancy prices were obtained for such. The consumption for the twelve months amounts to 1902 loads, or over 20 per cent. more than last year, while the stock is reduced to 216 loads, the whole of which, it may be mentioned, is held in second hands. Values all over were decidedly firm.

Oak logs.—The import was very moderate, amounting to only 974 loads, against 1,867 loads last year, and with the railway companies buying to a larger extent than for a few years, the consumption has shown a marked improvement, being nearly 500 loads in excess of either of the two preceding years. The stock on hand now is only 607 loads, a by no means sufficient quantity for the prospective requirements. Values have shown steady appreciation, and close at the highest point.

Birch logs (Quebec).—The supplies available have been quite insufficient to cope with the demand existing, and the entire import met with prompt disposal on arrival at good prices. Lumber, on the other hand, came forward much too freely, values in consequence ruling weak, and there is still a good stock on hand. Low port.—The position has been similar to that of Quebec, logs being scarce and commanding good prices, while lumber was rather plentiful and values low.

Deals, Etc. (Quebec).—The import of pine goods was on a reduced scale during the year, but, generally speaking, was of sufficient extent in view of the rather apathetic nature of the demand. First quality deals and sidings were in fair request, but the high prices prevailing served to curtail the movement, and the market for the other grades was at no time good, and values were maintained with difficulty. Spruce has proved a disappointing market throughout the year, the consumption revealing a very considerable shrinkage for reasons already explained, while values were inclined to sag.

Current values are as follows:—

First pine deals.—Broad, £38 to £41; 11-inch, £34 to £36; ends and non-dimensions, £23 10s. to £25.

Second pine deals.—11-inch and up, £25 to £27; ends and non-dimensions, £16 to £18.

Third pine deals.—11-inch and up, £16 to £17 10s.; ends and non-dimensions, £13 to £14.

Red pine deals.—9 and 11-inch, £11 10s. to £12 10s.; narrows, £9 10s. to £10.

First pine sidings and strips.—9 to 10-inch, £29 to £31; 11 to 12-inch, £32 to £34; 13 to 14-inch, £34 to £35.

Spruce deals.—9 inch and up, £9 to £10; 7 and 8-inch, £8 to £8 5s.

Lower port pine and spruce.—Arrivals during the year were light, a fortunate circumstance in consideration of the unsatisfactory demand in evidence. Spruce on the whole was a poor market and the consumption is disappointing, the direct arrivals of Riga deals having had a serious effect on the latter. Pine goods have met with little request.

Current values are as follows:—

Lower port pine and spruce.—9-inch and up, £9 to £9 10s.; 7 and 8-inch, £7 15s. to £8 5s.

### Riga Whitewood Replacing Spruce

Singleton, Dunn & Company, Glasgow, in their annual timber circular refer to the trade of Glasgow in Canadian woods as follows:

The consumption of waney and square pine has been practically the same as during 1910, and the continual increase of price is causing users to substitute other woods as far as possible. Oak and elm have also advanced materially in price, and stocks of both are abnormally low. Birch has sold freely, and the increased import has been readily disposed of. Prices are firm for good stock. The import and consumption of pine deals and sidings have decreased considerably. Prices for first and second quality have been high, but lower qualities have been rather weak. Spruce was slow of sale during the greater part of the year, but late in the season there was a better demand. Prices on the whole have been disappointing, and the consumption has decreased owing to the steady supply by liners of Riga whitewood at lower prices than spruce.

The import into London from January 1st to December 31st, 1911, included 946,289 pieces of pine and 1,599,040 pieces of spruce, as compared with 1,126,131 of pine and 2,007,636 of spruce during 1910.

The ratio of import to consumption (dock and overside) for 1911 was as follows: pine 88 per cent., spruce 89 per cent. For 1910, the ratio was pine 106 per cent. spruce, 111 percent.

The Dominion Sawmills and Lumber Co. Ltd., who have acquired extensive properties in British Columbia, are establishing their head office at Calgary, Alta., where their local representative is Mr. I. C. Smith.

## Liverpool Imports Were Moderate

**Labor Strife Caused Serious Interruptions—Scarcity of Tonnage also a Detering Factor—Light Stocks Now on Hand**

The following is a table showing the consumption and import of Canadian lumber deals, etc., at Liverpool, Birkenhead and Garston for the year ending December 31, 1911, with comparisons with the two previous years:—

	Consumption		
	From 1st Jan. to 31st Dec.		
	1909.	1910.	1911.
Quebec square pine, and wavey pine...	115,000	84,000	52,000
St. John and other ports pine...	Nil.	500	500
Red pine...	Nil.	5,000	1,000
Oregon pine...	211,000	325,000	258,000
Oak, Canadian and United States...	125,000	114,000	135,000
Oak planks...	1,280,000	1,333,000	1,557,000
Elm...	31,000	41,000	29,000
Birch logs...	231,000	161,000	184,000
Birch planks...	361,000	318,000	455,000
Ash...	151,000	155,000	206,000
N. B., etc., spruce and pine deals, stds.	37,560	36,320	34,410
Quebec yellow pine deals, standards...		16,140	12,610
Quebec red pine deals, standards...	21,040	4,250	3,120
Quebec spruce deals, standards...		4,620	4,370

	Import		
	From 1st Jan. to 31st Dec.		
	1909.	1910.	1911.
Quebec square pine, ft.	19,000	3,000	Nil.
Quebec waney pine, ft.	68,000	45,000	36,000
St. John and other ports pine...	500	Nil.	1,500
Red pine...	Nil.	5,000	Nil.
Oregon pine...	284,000	157,000	160,000
Oak, Canadian and United States...	63,000	92,000	125,000
Oak planks...	1,259,000	1,196,000	1,517,000
Elm...	24,000	38,000	26,000
Birch logs...	238,000	136,000	205,000
Birch planks...	377,000	269,000	484,000
Ash...	144,000	163,000	230,000
N. B., etc., spruce and pine deals, stds.	35,600	38,450	32,050
Quebec yellow pine deals, standards...		14,210	10,960
Quebec red pine deals, standards...	16,580	4,270	2,230
Quebec spruce deals, standards...	4,000	4,730	3,900

Stocks of spruce and birch in Liverpool and Manchester at the close of the year 1911, with comparisons for previous years, are reported by H. W. Lightburne & Company, Liverpool, as follows:—

	1907.	1908.	1909.	1910.	1911.
Spruce Standards—					
Manchester...	20,100	16,220	12,680	13,220	12,870
Liverpool...	7,160	7,760	5,800	7,930	5,570
	27,260	23,980	18,480	21,150	18,440
Birch Logs, Loads—					
Manchester...	180	120	150	100	160
Liverpool...	1,040	380	520	20	380
	1,220	500	670	120	540
Birch Planks, Standards—					
Manchester...	564	388	1,224	358	115
Liverpool...	242	497	594	297	473
	806	885	1,818	655	588

### Imports Into Manchester

The following table shows the consumption and import of Canadian lumber deals, etc., at Manchester for the year ending December 31, 1911, with comparisons for the two previous years:—

	Consumption			Import		
	From 1st Jan. to 31st Dec.			From 1st Jan. to 31st Dec.		
	1909.	1910.	1911.	1909.	1910.	1911.
Quebec board pine and		406,000	339,500		266,000	466,000
Quebec square pine, ft.	484,000	19,500		447,000	2,000	
Oak, Can. and U. S.	22,000	18,500	45,000	6,000	19,500	49,500
Birch logs...	71,500	54,000	107,000	73,000	51,500	110,000
Birch planks...	231,000	262,500	181,000	369,000	119,500	141,000
Spruce deals, stds.	58,930	56,980	52,520	55,390	57,520	52,170
Pine deals, stds.	5,340	5,570	5,770	5,290	5,560	6,520

### Timber Trade of Mersey Ports

Farnworth & Jardine, Liverpool, report upon the timber trade of the Mersey ports during 1911 as follows:—

In volume, the business of the past year was somewhat similar to that of 1910. Fair general demand, and with a few exceptions little fluctuation in values, but labor troubles caused serious interruptions. Imports, generally, were moderate, less than anticipated, largely owing to difficulty in securing tonnage during the latter part of the season. The consumption naturally has been restricted, and shows in the aggregate a reduction compared with the previous year. Stocks are light, and values of most of the leading articles firm. Rates of freight had an upward tendency throughout, and for the coming season a higher basis than we have had for some years is not improbable.

Quebec Yellow Pine Timber.—The quantity imported to Liverpool was very light, even less than in 1910, the smallest import on record, but to Manchester, although moderate, the arrivals show an increase on the two pre-

vious seasons; the demand has been quiet, but the deliveries have been fairly satisfactory. Stocks in first hands are very limited and values rule high. Waney pine, 1st class.—The arrivals were largely to Manchester on contract, and practically for direct consumption, but owing to delay in delivery from the quays, the stock, though really light, appears in the tables more than what is actually available; values are very high. 2nd class has been in limited request, prices have improved, and the stock of this quality is also light. Square pine is only in limited demand, and the arrivals unimportant; the stock, although small, is apparently sufficient, and difficult to move. Red pine is seldom enquired for, and only in retail quantities. Oak logs.—The demand has been practically restricted to special specifications suitable for railway requirements; the import amounted to about 80,000 cubic feet, compared with 54,000 cubic feet the previous year, the bulk going direct into consumption. The stock, viz., 34,000 feet, is light; values are steady. 2nd class oak is difficult of sale. Elm (Square Rock).—Owing to limited supply abroad, the import has been a small one, the consumption more than kept pace, and the stock is low; there is more enquiry for fresh timber, and prices rule high. For round rock elm there is a limited demand. Ash (sq. hewn) is seldom asked for, but in the round log (unbarked), an extensive business is carried on from United States Ports. Quebec birch was imported more freely than during the previous season, viz.:—227,000 cubic feet, against 123,000 cubic feet in 1910. Early shipments arriving on practically a bare market, prices improved, and continued fairly steady throughout the season, the deliveries were satisfactory, and present stocks are moderate; values are firm. Planks and boards have been in fair request, Maple.—For round logs, sound, fresh and of large dimensions, suitable for rollers; there is a limited demand. Maple flooring, planed, etc., has been in fair request, but imported more moderately. Sycamore, chestnut, etc., arrived in small quantities, the demand is nominal.

### Decreased Import of Pine Deals

Quebec Pine Deals.—The arrivals of pine deals, sidings, boards, red pine, etc., have been less than in 1910, viz.:—18,319 standards, against 21,535 standards. Pine deals.—There has been a fair demand throughout the season, and values remained very firm, the higher grades commanding extreme prices, the stock of these is light; consumption has been good and stocks are less than at corresponding time last year, but probably sufficient for requirements; 3rd and 4th quality deals have moved more freely during the past season, and good sidings have been in request. Red pine deals and boards arrived to the extent of about 2,400 standards, which is considerably below the quantity imported last season, viz.:—4,500 standards; the business in these goods has been rather disappointing, and values difficult to maintain. Spruce deals.—The arrivals amounted to about 8,000 standards, and consisted chiefly of unassorted quality on contract; deliveries were satisfactory, and stock moderate; values steady.

New Brunswick & Nova Scotia, etc., Timber.—St. John and other ports pine have practically ceased to be imported, the only arrival during 1911 having been 1,500 cubic feet from St. John, of which 1,000 cubic feet remain in stock. Birch.—Logs, chiefly from St. John, N.B., and Halifax, N.S., have been imported to the extent of 129,000 cubic feet, against 63,000 cubic feet last season, there has been a good demand at satisfactory rates, and a very small stock remains on hand. Birch planks have been imported on a much heavier scale than in the previous year, but met with good demand; stocks are not excessive, values improved as the season advanced, and the market is firm. Birch squares.—The demand is limited.

Spruce and Pine Deals, etc.; N.B. and N.S. Spruce Deals.—The imports to the Mersey and the Manchester Canal during the past year were considerably below the figures of the previous season, viz.:—84,850 standards, compared with 93,530 standards in 1910. Manchester's proportion was about 61 per cent., Liverpool, Birkenhead and Garston about 39 per cent. The season opened with fairly moderate stocks, and values were well maintained until July, subsequently lower rates were accepted for consignment cargoes, and business was seriously interfered with by strikes amongst seamen, railway men, carters, and dock laborers, cargoes arriving during the strikes accumulated, the position being further aggravated by the shortage of railway wagons to deal with the traffic when the labor troubles were finally adjusted; scarcity of tonnage and advanced ocean and freight rates later in the season curtailed the import considerably, and values recovered; deliveries on the whole have been satisfactory, exceeding the arrivals by 2,680 standards; present stock is moderate and values firm. Riga whites, of the cheaper qualities, have again been supplied very freely and in strong competition for making packing cases, etc. Hemlock has been in fair request; arrivals have not been excessive. Pine deals arrived more freely, but the demand has not been active; shipments of the better class in really good condition meet with some favor, but the lower grades and unconditioned stock are neglected.

British Columbia and Oregon Pine.—The moderate import of 156,000 cubic feet has been in about equal proportions of logs and planks, all reaching the market in liner parcels; consumption has more than kept pace, stocks are reduced to very moderate compass, values are firm.

### Spruce Imports Into the United Kingdom

The following estimated total import in standards of spruce to the United Kingdom is furnished for the following years by Messrs. Smith & Tyrer, Liverpool, Eng.:

	1911	1910	1909
From			
Nova Scotia...	59,880	59,130	56,880
Province of Quebec...	56,720	51,870	51,360
St. John...	60,320	67,240	57,570
Other N. B. Ports...	64,830	75,240	75,210
Total...	241,750	253,280	241,020

The stocks of wood in London public docks at the end of the year 1911 included 486,825 pieces of pine and 640,058 pieces of spruce, as compared with 614,709 of pine and 704,852 of spruce at the conclusion of the year 1910. Deliveries of pine during the year from London docks amounted to 462,097 pieces of pine and 767,313 pieces of spruce, as compared with 441,535 of pine and 752,597 of spruce.

Two dollars per thousand duty on lumber from the States was urged in a resolution passed by the associated boards of trade of Eastern British Columbia at a convention at Rossland recently.

### Exports of Forest Products to United Kingdom

The following table shows the values of exports of forest products from Canada to Great Britain during the year 1911 and the two preceding years:

Classes—	1909	1910	1911
Totals .....	\$ 9,845,422	\$11,033,074	\$11,965,131

Other articles of the forest .....	1,437		

### Current Lumber Trade in United Kingdom

Liverpool, Jan. 17, 1912.—At Liverpool, business in softwoods has been moderately active since the market cast off its Christmas-New Year holiday mood. The public sales which have been held have attracted much attention and buying has gone on at them with a degree of animation which has spoken well for the trade. Quebec spruce, which has been offered, has been readily taken up, 3x11 selling at £10, 5s., 0d.; 3x10 at £10 and 3x6 at £8, 5s. 0d.

Floorings have sold at £12 to £10 for 7x1; 1st red and deals of good, sound quality have been taken up freely and are in demand. The demand from the packing-case trade has kept up satisfactorily, and much spruce has been delivered to case-makers since the beginning of the year. Prepared, yellow pine boards have had a fair sale. Boards 1¼x5 have brought 11s. 6d. per 100 ft. super.; 1x5½, 9s. 9d.; 1x5, 9s. 3d. and ¾x4½, 5s. 6d. Prices of lumber continue very firm and tend upwards owing, in part, to the higher rates of freight which are being demanded by shipping companies. The improving demand for practically all kinds of softwood of sound quality, has however, something to do with the upward tendency which values show at the present time.

At Liverpool, stocks generally are small and deliveries have been on a scale which has shown that the consumption has begun the year with fair activity and of good extent. The demand for lumber has been satisfactory. Waney board and square pine have sold steadily, the small quantities coming to hand being sold on arrival. Pine deals and boards meet with a good demand, and stocks are still within a small compass, while prices are very firm. Spruce deals from New Brunswick and Nova Scotia have passed freely into consumption, the deliveries of late being much in excess of the quantities imported. Pitch pine has been in demand, hewn and sawn wood being taken more readily. Parcels arriving are being forwarded by rail after delivery from ship.

The activity in the shipping trade is making it difficult to arrange for

early deliveries owing to the demands on shippers for freight space, and to the higher rates of freight which must affect the selling price of timber.

Oak continues to meet with a ready sale. Logs of large size and straight, have been inquired for, and have sold steadily. Planks for wagon building have been in more demand. Stocks of logs, planks and boards are still very light, in comparison with the stocks of a year ago. Birch logs have sold more freely but a fair stock of this class of wood is held. Planks have met with a good demand and values have hardened. Ash of prime quality has been more inquired for, and is firm at recent values. Satin walnut boards have been in demand but the high prices, especially for forward delivery, are restricting business. Walnut logs of first-class quality have been wanted, and such as have been offered have sold readily at good prices. The outlook in the Liverpool market has improved since the beginning of the year.

At Manchester, the demand for lumber has been very fair, since business got properly under way for the year. Pine deals have met with a moderate inquiry. Spruce deals have sold freely but stocks are fairly large, in comparison with the demand. Quebec board pine has had a good sale, but is held in rather large supply. Oak has been much inquired for and stocks are now small.

At Hull, the market has been slow to assume its normal activity, since the holiday. A fair demand for spruce deals, for yellow pine boards and for sawn pitch pine, now exists.

At West Hartlepool, a promising start for the year was made. Round timber has been in more demand, and sawn wood is selling freely. Pit-wood has found a ready market and promises to be a staple article of the trade, as it was last year. Inquiries have come to hand for sawn wood, generally, in a way which has promised much for the year.

At the Tyne ports, spruce deals and sawn wood have been in active demand since a start was made for the year. Ship-building, coal-mining and their dependent industries are active and flourishing, and are making greater demands for timber for constructional purposes and for deck-work and other uses in ship-building. Pit-wood is still in demand and vast quantities of this wood are being absorbed by the collieries in the district. At the Tyne ports the year has opened with much promise for the timber trade as for the two staple trades of Tyneside named.

At Glasgow, the trade began the new year as it closed the old one, with a fairly large volume of business passing, and with excellent prospects. The activity in the Clyde ship-building industry has been of much advantage to the timber trade, while the improvements in trade generally, which has taken place, has also been of benefit to the timber trade at Glasgow. Yellow pine of prime quality has been in good and increasing demand but supplies of this wood have become so sparse, that prices have risen to a high point, and those who have been users of the wood have taken other wood instead of yellow pine. Siberian pine, California pine and redwood and Columbian pine are being used instead of the yellow pine which was lately used. Oak suited to wagon builders' requirements continues to be taken freely. Planks and any kind of clean and straight wood which can be cut to useful sizes and worked with fair ease, finds a ready market at full prices. Last year was a good year to Scottish timber merchants. The present year promises to be at least as good as 1911. Merchants, in fact, looking for an improvement on last year's trade.

### Death of Mr. Thomas H. Shevlin

The death of Thomas H. Shevlin which occurred at Pasadena, Cal., on January 15th, removes from the lumber industry a man who was perhaps more widely known and admired in the United States and Canada than any other lumberman. In Ontario, Mr. Shevlin was known principally as a member of the Shevlin-Clarke Lumber Company which recently erected one of the most modern and efficient saw mills in America, at Fort Frances, Ont. Mr. Shevlin will be remembered however, by the older members of the lumber business, as one of those who had much to do with the great lumber industry of Albany, N.Y., in its palmy days and as the man above all others who brought the lumber trade of Minneapolis to its present commanding place in the lumber world. Mr. Shevlin's history was representative of that of so many other lumbermen who have risen from the ranks by the sheer force of their personality and their determination to be always achieving results. From the earliest days of his employment as a clerk in an Albany lumber company's office until almost the last day of his life he was engaged in active work and whatever he undertook he invariably completed in a remarkably thorough manner. Mr. Shevlin was a many-sided man. His acquaintances in the lumber industry were apt to think that his active business life must prevent him from taking any close interest in other affairs. This however, was far from the case. He was a man of wide learning and deeply versed in history. He was an extensive reader of biography and he found time to devote liberally of his ability and his means to many charitable institutions.

The character of Mr. Shevlin was in fact that of the ideal successful man of affairs and the warm-hearted generous helper of his fellows. His loss will be mourned widely wherever he was known.

After two days' illness, Mr. Martin Power, owner and manager of the Steamship Supply Lumber Company, died at the age of 65, at his residence, Park avenue, Montreal. Death was unexpected, and was due to heart failure. Mr. Power, who was a native of Richibucto, N.B., resided in Montreal for 30 years. He was for several years connected with Messrs. Watson & Todd, lumber exporters, and left them to become owner of the Steamship Supply Company. A widow and daughter survive.

The death is announced, in Montreal, of Mr. Allan Cameron, for many years at the head of one of the largest cooperage businesses in Canada. Mr. Cameron was ill for three months. He was born in Greenock, Scotland, in 1826, and came to Canada at 14 years of age, learning his business with his uncle, the late Mr. Archibald Ferguson. Mr. Cameron, who retired from business in 1889, leaves four sons and four daughters.

# Linderman Automatic

## from Two to Three Mi

This saving, and the fact that it is annually, was one—and in truth—the leading inducement, for one of the large Canadian Box Factories to order a 12-foot Linderman Automatic Dovetailer.

The saving does not stop at the above figures. When you look at your immense edging waste have you ever wondered how it can be reduced? The Linderman method can help you.

When you figure that 1000 board feet yields you only 750 feet of matched shooks, have you asked yourself,

can it be bettered? It can be; the Linderman method does it.

What is the Linderman method? It is simply common sense,—the joining together of several pieces of equal length lumber, of miscellaneous widths into a panel that is several inches wider than the width desired. This piece is then passed through a sizing saw, ripped to width and the edging which is several inches wide is passed back through the Linderman Dovetailer and joined to another panel.

# The Miramichi Industry in 1911

## Increased Cost of Production, High Freight Rates and Lumber Disturbances Combined to Depress Trade

By G. P. Burchill

Opening under normal prospects, which gave no indication of subsequent developments, the past season's business in the Miramichi district will long be remembered as one of the most discouraging and unprofitable in the history of that industry. Such, in short, is the—not to say enthusiastic—report which we regret to make of the trade on this river during 1911.

The causes of the depression, as our review will show, may be grouped under the following two headings:—(1) Increase in cost of production; (2) Low deal market values, precipitated by labor troubles and high freight rates.

(1) Increase in cost of production.—The lumber industry, with the exception of the pulp and paper and tanning industries, constitutes the industrial life of this section, so that conditions in the timber trade, be they prosperous or otherwise, are reflected throughout the entire economic and commercial life of the community. The trade had just passed through a most satisfactory year in 1910 and lumbermen began operations with a view towards making an increased cut in 1911. The labor market was aroused, of course, by the wave of prosperity and with the greater demand, wages soared to such an extent that operators paid as high as \$34 to \$35 per month and board for choppers, \$32 to \$33 for teamsters, and \$30 to \$31 to sawyers, an increase of about \$2 a month all round, over the preceding year. But high as wages seemed in the fall of the year, the spring saw a new mark reached in the scale of stream driving wages when peavymen received \$2.75 per day and board, and in some cases \$3.00—as against \$2.25 to \$2.50 in 1910. It is not hard to see, therefore that high cost of production was due, in the first place, to the high price of labor.

The cost of labor, however, was of minor importance when compared to developments which followed during stream driving operations, in the form of weather conditions or the lack of them—necessary for the water transportation of logs. As a result of no rainfall, we estimate that upwards of fifteen million superficial feet of lumber was hung up on the Miramichi and its branches; while drives which did reach market did so, for the most part, at almost double the cost of ordinary years. This problem of our water supply has been assuming very grave proportions of late years and the outlook for the future is not very reassuring. Rivers, in days gone by, whose unleashed torrents generated a latent force, which when harnessed to a process of manufacture produced power capable of driving the machinery of a first class mill, now are sluggish streams, which certainly would not inspire a modern Tennyson to proclaim the fact "that they go on forever"; and while the old time spring freshet even under what we would call good driving conditions in these years has become a very tame and harmless force, last spring, we may say, there was no freshet at all. One may form some idea of how wretched conditions actually were, when we point to the fact that on one stream to our knowledge, a drive of about one million feet of logs struggled along for twenty-two days and in that time covered a distance of about four to five miles—the work of so many hours in the days of pioneer logging. Let us add that there is no doubt in our mind that the cutting away of the forest at the heads of streams is responsible for present-day conditions, and the diminishing supply of water on the Miramichi system, as well as on many of the neighboring streams, affords excellent testimony as to the value of forestry warnings and statements regarding the care which should be exercised in this respect.

### High Freight Rates—Labor Disturbances

(2) We turn now from the activities of production to note the movements of the trans-Atlantic deal market during 1911. But first, just a word of explanation. We say trans-Atlantic, because the import duty which stands guard over the interests of the American operator has barred our lumber from that market, and moreover, as New Brunswick spruce and pine are more in line with the demands of the steadier market across the ocean, our deals have always been manufactured for the British timber trade.

Now as to market values. Prices for a fair specification, say 50 and 50, at the opening of the season seemed steady, but labor disturbances which had been threatening for some time finally broke out in midsummer and practically tied up business in all directions. Prices, of course, declined and up to the end of the season had not recovered from the effect of these developments.

While the market at the opening of the season remained firm, sales were made on c.i.f. terms for midsummer and fall shipment which compared very favorably with those of the preceding year. But although later prices declined, freights began to advance, which of course made the situation worse, to such an extent that in the

early fall, consignors, in order to secure tonnage to lift their contracts were forced to pay as high as 47s. 6d. per standard. On comparing this with 36s. to 37s. as the high mark of 1910 one can easily see what the difference meant. The high freight rate was due, first, to a general strike of sailors which affected the whole merchant marine, and secondly, to the unprecedented crop of cotton in the southern States of America which created a steady demand for tonnage in that trade.

### Wintering Stocks Unusually Heavy

As a result of these adverse conditions both at home and abroad, lumber shipments during the past season were extremely light and wintering stocks are correspondingly heavy. The following figures which show the comparison between the shipments of 1910 and 1911 speak for themselves:

Port of Miramichi			
	No. of Vessels	Tonnage	S'ft Shipped
1910	44	61,397	79,010,244
1911	33	40,284	54,005,290

Regarding stocks, while actual figures have not as yet been published, it is estimated that there is upwards of sixty million superficial feet of deals wintering this year in Miramichi, which, when compared with twenty-three million as the stock of 1910, shows a very large increase over the preceding year.

With these heavy stocks the outlook is not of a very encouraging nature, but it is hard to say as yet what may develop. For this reason we are unable to form any idea as to the probable market values in the spring. Business activities are exceedingly dull, however, and operators are proceeding very cautiously. Indications at present point to about half the usual cut.

## New Brunswick Trade During 1911

### Unsatisfactory Conditions Brought About by Labor Troubles, High Freight and foreign Competition

(Specially Written for The Canada Lumberman)

The season of 1911 was a very unsatisfactory one for those engaged in the lumber industry in the Province of New Brunswick. The prices throughout the United Kingdom were very low and freights high. The small demand for lumber in Great Britain was caused by strikes and general unsettled condition of labor, especially we might mention the dock laborers' strike. At the same time we are now really beginning to feel the keen competition of what is known as "The Riga Deal." The forests in Russia are just being exploited and this lumber comes in direct competition with the lumber shipped from the Provinces of New Brunswick and Nova Scotia.

In the past ten years the transatlantic shipments from New Brunswick ports have decreased some two hundred and four million, or in other words, in the year 1900 there was shipped from the Province of New Brunswick four hundred and eighty-nine million feet of spruce deals, scantling, &c. In the year 1911 this shipment was reduced to two hundred and eighty-five million feet of spruce deals and scantling. The shipments have gradually decreased from year to year, until the past season of 1911, the smallest in the history of the lumber export business in the Province.

However, it might be said that although the transatlantic shipments were materially less last year than ordinarily, the cut of lumber for the winter season of 1910 and 1911, throughout the Province, was fully up to the usual amount. This, taken into consideration along with the small shipments, explains the large amount of sawed lumber on hand and held over for next year.

In reference to stocks held over, these are the largest that have ever been carried over by the lumbermen in the Province, being, by a very conservative estimate, fully 200,000,000 ft. manufactured and on hand at present, compared with stocks held over other years of not more than 100,000,000, or about one-half.

One new feature that should be mentioned in reference to the lumber industry in New Brunswick is, the fact that a new customer has been found in Australia, whither some two or three million ft. were shipped last season.

Shipments to the United States, Boston, New York and Sound Ports, have been virtually about the same as other years, viz.: about 50,000,000 ft. Pulp wood was shipped to the United States to the extent of about 74,000 cords for the past season of 1911, compared with 90,000 cords in 1910.

The repeal of the "Pike Law," so called by the United States, will materially affect the lumber business on the St. John River in New Brunswick. By this law bona fide American citizens were privileged to cut logs in the State of Maine on the head waters of the St. John River, drive the logs to Fredericton and raft them

from there to St. John, and when these logs were manufactured in St. John and Fredericton, this lumber was allowed to enter the United States free of duty. This law was repealed and the repeal went into effect last summer. The lumbermen who have been engaged in this business heretofore will feel the effect this coming season, as all lumber manufactured in the Province of New Brunswick, going into the States, is now subject to duty of \$1.25 per thousand, and 50c. a thousand on shingles, which would be practically about \$5.00 per thousand duty on the cedar in long lumber. The increase of duty on cedar shingles going in to the United States, has nearly put a stop to this industry in New Brunswick.

The outlook for prices and demand for the season of 1912, is not the brightest that could be desired. Taking into consideration the large amount of lumber in stock at present, the large quantity of logs held up in the drives last spring, and the keen competition in the United Kingdom from the Riga deal, leads to a conviction that caution should be the watch-word of all who are engaged in the lumber industry in New Brunswick.

### New Brunswick Crown Land Receipts

The following financial statement shows comparative receipts of the Crown Lands Department of New Brunswick from lumber, etc., during 1911 and 1910.

	1910	1911
Sales of Timber Licenses	4,238.75	2,176.00
Renewal of Timber Licenses	81,057.00	81,206.00
Stumpage	330,360.28	367,679.14
Land Sales	4,188.75	5,440.90
Labor Fund	258.70	146.60
Instalments	56.30	89.50
Deposits for Survey	721.50	1,286.00
Orders of Survey	145.00	459.00
Transfer of Timber Licenses		644.00

Total receipts of the Department from lumber, mining, fishing, etc., were \$528,439 during 1911 and \$494,491 during 1910, an increase for 1911 of \$33,947.

The following statement shows the quantities and kinds of lumber cut from Crown Lands in New Brunswick, for which stumpage bills were rendered during the year ended 31st October, 1911, with the amount of stumpage charged thereon.

Quantity	Kinds of Lumber	Stumpage
228,456,525	s. ft. Spruce and Pine Logs	301,903.57

### Shipments From New Brunswick Ports

New Brunswick, like the other lumber exporting provinces of Canada, experienced an unsatisfactory year's business during 1911. The exports from St. John for instance declined from 146,564,036 feet in 1910 to 122,184,947 feet in 1911. There was a similarly reduced export from other New Brunswick ports. The depression in the United States and the labor troubles in England, together with a reduced cut, on account of many logs being held up during the spring through lack of water, were the principal contributing causes. Shipments from the port of St. John for 1911 and the three preceeding years were as follows:

	1908	1909	1910	1911
	Sup. ft.	Sup. ft.	Sup. ft.	Sup. ft.
John E. Moore & Co., Ltd.	43,727,541	48,182,020	47,678,658	36,103,574
W. M. MacKay	40,060,416	42,548,238	46,501,944	36,589,707
George McKean	15,970,059	26,662,679	23,097,386	17,491,666
Alex. Gibson Co.	25,173,212	20,238,517	19,738,343	32,000,000
Others	10,677,743	7,300,000	9,547,705	
	135,608,971	144,931,454	146,564,036	122,184,947

The shipments of lumber from Dalhousie to ports other than Canadian during the year 1911 amounted to 25,685,342 sup. feet of deals, and 22,150 cords of pulp wood; 19,000,000 laths, carried in 36 vessels registering 50,373 tons. In 1910 the total of shipments was 24,000,000 sup. ft.

Approximately 18,000,000 feet of deals were shipped from Hopewell Cape during the year 1911.

The lumber shipments for the port of St. Stephen for eleven months ending Nov. 30 were valued at \$205,929.

The foreign lumber exports of the outports of Moncton for 1911 show a slight falling off compared with 1910. Comparison as follows:

	1910.	1911.
Shediac	\$ 63,721	\$ 23,689
Dorchester	52,460	31,297
Hillsboro	119,700	79,785
Riverside	179,938	224,292
Point Wolfe	4,307	16,783
Waterside	2,776	
Alma	85,280	89,871

### Slight Increase in St. John Exports to United States

Exports of lumber to the United States, from the port of St. John, N.B., for the years 1911 and 1910 were as follows:

Articles	1910	1911	1911, Quarter Ended			
	Total	Total	March 31	June 30	Sept. 30	Dec. 31
Fire Wood	1,461	725		365	360	
Kiln Wood	1,820	202			203	
Laths	348,769	346,051	21,396	124,970	105,474	94,210
Lumber	339,531	352,236	35,125	62,870	101,761	152,479
Pulp Wood	75,318	126,729	269	37,950	51,542	36,967
Railroad Ties	256	1,476	752		723

### Reduced Cut in New Brunswick

St. John, N.B., January 9, 1912.

Editor Canada Lumberman:

The quantity of logs cut on the St. John River this year will be an average cut. In other parts of New Brunswick such as the Miramichi, operators claim that the cut will be materially reduced. The stocks of manufactured lumber for the English market on hand throughout New Brunswick and Nova Scotia are considerably larger than for some years past. The weather conditions for cutting last fall were good. We have not yet sufficient snow for hauling, so it is quite impossible to say yet whether all the stuff will be brought forward to the streams or not.

The past year has not been a profitable one for the lumber exporters in New Brunswick and Nova Scotia. Failures and strikes in the United Kingdom dislocated business for some time. Markets declined and ocean freights advanced, which made it very bad for the shippers. It is as yet impossible to form any forecast for 1912. It looks now as if ocean freights would be considerably firmer than for the past few years. The cotton strike now on on the other side must have a bad effect on next year's market.

Yours truly,

JOHN E. MOORE.

### Favorable Weather Conditions in New Brunswick

Nordin, N.B., January 13, 1912.

Editor Canada Lumberman:

The logging operations in this district are comparatively small this winter as most of the mill owners hold a considerable quantity of logs over since last year. The weather conditions have, up to now, been very favorable. Very little snow in the woods up to the new year facilitated the yarding, and enough snow for the hauling has now fallen.

The stocks of sawn lumber on hand are very heavy. Several mills are carrying over the greater part of last year's cut.

The English market last year was very dull, and as the freights were steadily increasing during last year most lumbermen found it impossible to make profitable sales. To this has to be added that the driving last spring was extremely expensive in this district. Last year must therefore be considered an unfavorable year for the lumbering industry. The local market, however, was fairly good, and especially hemlock was in good demand.

In regard to the outlook for business during 1912, it is still too early to say anything definite. One feature, however, which must influence the business, is that the freights seem to be still higher than last year. Ship-owners on the other side ask 50 sh. or more for deal cargoes Miramichi-England, as compared with 37/6 early last spring.

Yours truly,

THE SWEDISH CANADIAN LUMBER CO. LTD.

Transatlantic shipments from the Province of New Brunswick, dating from the years 1909 up to the present were as follows:

1900	489,000,000 ft.	1906	420,000,000 ft.
1901	398,000,000 ft.	1907	355,000,000 ft.
1902	445,000,000 ft.	1908	324,000,000 ft.
1903	388,000,000 ft.	1909	325,000,000 ft.
1904	358,000,000 ft.	1910	327,000,000 ft.
1905	343,000,000 ft.	1911	285,000,000 ft.

## Foreign Lumber Consumption in N.S.

Nearly One Million Dollars Worth Imported Annually—Much of Which Could be Produced at Home

By J. B. Whitman

To give the actual quantity of the various kinds of timber used in domestic consumption in Nova Scotia is rather a difficult task, for notwithstanding that lumber and wood are imported and used so extensively, the very prevalence of this importation is one of the main reasons why we know so little about it. We accept the things of everyday life as a matter of course and do not bother with concrete facts as to how or why they come about.

We might safely say that so far as Nova Scotia is concerned, there are but few exceptions when she really needs to go outside of her own borders for wood, for the products of her forests embrace a variety of kinds, suitable for many specified purposes. Nova Scotia produces wood for any purpose ranging from a wharf to a piano. Of course in the manufacture of a piano a number of foreign woods are used, but the writer has been told that they are not really necessary and that Nova Scotia wood is suitable but foreign wood gives the sales-agent something more to talk about when trying to make a sale.

Notwithstanding that Nova Scotia is a country of wood as well as a country of gold, iron, fish, fruit and coal, it is a matter of surprise that the import of foreign wood is as large as it is. The actual facts of the case go to show that whether the necessity exists or not, the importation certainly goes on notwithstanding the fact that there are other outlets for the money that the little "Province by the Sea" takes in so plentifully from her mines, her forests, her fisheries and her fruits. A redeeming feature, however, is that some of the wood is exported again in the shape of the finished product.

During the fiscal year ending March 31st, 1911, Nova Scotia imported directly, nearly twenty million feet of lumber and to this is to be added another quantity imported indirectly through the port of St. John, N.B. The total quantity cost when laid down at the point of manufacture and consumption is nearly one million dollars.

### The Uses of Imported Lumber

The matter of the annual export of lumber can easily be understood for the world markets are open and ready to take immense quantities, but the question of the import of such a comparatively large quantity provides food for thought. The questions that arise are, "It is partly necessary and it is used for shipbuilding, railway cars, bridges and for finishing and ornamental work." The kinds are chiefly hard pine, oak, white ash, whitewood, cherry, cypress and mahogany, with a small quantity of boxwood, lignum vitae, ebony and African teak. Nova Scotia does not produce wood that is suitable for some of the purposes for which hard pine is used, viz.: spars, yards and beams for ships and where length and size are both required, as in girders for bridges and large buildings. With regard to oak and white ash, both ought to be eliminated from the importation, as they can be grown very successfully at home, but while they can be imported at present prices, there will not be any active move to plant Nova Scotia areas with these trees.

However, the price of these woods is likely to advance in the very near future, for several reasons, chief among which are the increasing demand and the diminishing supply. Active measures will then have to be taken to reforest with these valuable woods and the part of wisdom would be to commence now, so that when scarcity and high prices come, provision will have been made to meet them. Most of the other varieties imported are used for finishing and ornamental purposes, and do not enter into any economic scheme of prices being ruled by supply and demand. It is probable that prices of some of the ornamental woods may become less, particularly of mahogany, for there are large areas of this wood to draw from and as transportation facilities are extended more and more into the centres of the producing districts, the price will not be likely to advance.

The use of most of the other kinds of ornamental woods depends largely on the prosperity of the country; for increased prosperity means increased use of foreign and valuable woods.

Unless the kinds above mentioned are applied to some new and different uses, the quantity imported will not increase rapidly, but should be in proportion, to wealth and population.

About one-half of the whole importation of foreign wood coming into Nova Scotia is used in the manufacture of railway cars, and as the Western Provinces must have these cars, this is one of the things that should be fostered by every possible means, for it seems to be one of the ways by which Nova Scotia can get a return from the West for the money that has to go there for wheat and for some of the cream of her population. No effort should be spared by both government and people to develop and increase this great and growing industry. Railway cars are unlike many other manufactured articles, for there is no transportation charge when they are ready for market.

The province of Nova Scotia has, in round numbers, half a million people. She exports annually some three hundred and forty million feet of lumber, uses for domestic purposes about eighty-five million feet and imports about twenty million feet, making a grand total of four hundred and forty-five millions—being an annual handling of lumber of eight hundred and ninety feet per head of her population. This considered with the other industries, ought to be a pretty good showing.

### Large Imports of Pulp and its Products

Notwithstanding that these figures show the lumber trade of the province to be in a healthy condition both as to exports and imports, there is one line of which not much has been said, namely, the pulp trade. The value of the finished product imported into Nova Scotia in the shape of books and papers and all other manufactures from wood pulp, is a large item. But here again the province is about to come into her own by the manufacture of wood pulp and its exportation. At the present this is already true, as to the partly finished product, but later undoubtedly the finished product will be exported in quantities that will place this industry on a par with the largest and most important of those that depend on the natural resources of the country. Then, if to the quantity of lumber for each individual of the

population there is added the amount of pulp that will be produced, the showing will be greatly increased.

This is no idle dream, for the manufacture has already begun in good earnest, and while the figures of the present production could not be obtained, they are substantial and increasing, the province having some six mills in operation, with the prospect of having two more of good size built in the near future.

Although Nova Scotia is next to the smallest province of the Dominion, there is no reason why she should not rank in importance with the largest for importance does not always mean quantity produced, but may mean quantity per acre or quantity per head of the population, and quality is also to be considered.

In conclusion perhaps a word should be said about the wood that is imported as finished product—represented by furniture, including pianos and organs, wagons and sleighs, farming utensils, toys and fishing rods. A part of this could be classed as foreign, while the remaining portion of it comes from the other provinces. Yet all this adds to the volume of the trade in wood and should be included in the amount of total import. But of this it would be very difficult if not impossible to get at even the approximate figures.

## Nova Scotia Lumber Trade in 1911

Many Disturbing Factors Prevented the Industry from Enjoying Prosperity—Depression in U.S. Markets

By T. N. McGrath

The goddess of luck did not beam as expansively on the lumbermen of Nova Scotia in the year 1911 as was her wont, writes T. N. McGrath in the Halifax Herald. To state the case briefly, the lumber season of 1911 was not a success. At least this is what the high minds in the business in this province will tell you, and if any one ought to know, they should.

While the season has not been what might be called a distinct failure, it has not shown the satisfying results of other years. Nevertheless, if there have been more successful years, there have been distinctly more unsuccessful ones. So that taking it all in all the lumberman isn't doing much grumbling. Rather he is inclined to bear the oppressions of the goddess of chance with patience and fortitude and with something of philosophy, for if he is heard to murmur at all his mumblings sound something like this, "it might have been worse."

There are, of course, reasons why the past season has not been a successful one from the lumberman's standpoint. In the first place, there was a great scarcity of rain during the early part of the season, and as a consequence the water in the streams remained at a very low ebb, thus preventing operators from getting all their drives out. A percentage of last winter's cut is still in the woods.

Then again, the British and United States markets have been away below normal, leaving the South American and West Indies markets to fill in the hole in the lumberman's exchequer.

There are in reality four markets for Nova Scotia lumber. South America is the principal mainstay of western Nova Scotia. In the central part of the province most of the lumber goes to the United States; while the mills along the I. C. R. and eastern shore, ship chiefly to the British market. During the past season, however, the mills along the eastern shore have been idle.

The South American market, which is in reality the mainstay of the biggest lumber operators in Nova Scotia, has been about normal during the past year. But, as has been intimated, the output for this market has been greatly restricted by a scarcity of water. There has been sufficient water to float the logs down the streams. But in reality it was the curtailment in supply which kept the market normal. Had there been good driving there would have been a poorer market, because there would have been more logs than were required. The market would have been glutted.

The prospects for next season in the tropical markets is said to be exceptionally bright. More inquiries are being received at the offices of the big lumber concerns than ever before. There appear to be more opportunities in fact for selling lumber in these markets now, but values haven't as yet been placed.

The cut of logs this year will be much smaller than in other years, chiefly on account of the large amount left over from the past season.

The lumber cut for 1911 will amount to at least 400,000,000 superficial feet. Prices were not quite so good as in 1910, and there was some delay in getting out the logs owing to the low river levels, 200,000,000 was exported; the remainder was made up of cord-wood, colliery timber, fence posts and pulp logs.

Exports of lumber, etc., from the United States Consular District of Halifax, N.S., for the years 1911 and 1910 were as follows:

	1911	1910
Laths ... ..	\$ 57,080.67	\$ 32,594.02
Lumber ... ..	371,750.85	370,396.56
Pulpwood ... ..	91,675.91	6,298.22
Hemlock bark ... ..	227.00	

## Quebec's Exports Undergoing Change

### Totals Remain Stationary But Items Fluctuate— Exports of Manufactured Articles Increasing

From the accompanying table secured from the American Consulate at Quebec by the Canada Lumberman, it appears that the total of the exports of forest products from Quebec was practically the same in 1911 as in 1910, the latter year 1911 showing only the trifling increase of \$266.83 over 1910.

There were however notable changes in the various items classed under that heading, which it will be interesting to note, and the chief interest relates to the exports of pulp wood and wood pulp. For the first time in the history of this consular district do the exports of wood pulp to the United States almost equal those of pulp wood, the former aggregating in value \$1,273,868, the latter \$1,290,500. It is significant to note also, that the exports of the wood decreased from \$1,702,644 in 1910 to \$1,290,500 in 1911, while those of wood pulp increased from \$765,131 in 1910 to \$1,273,868 in 1911, or more than \$500,000. The exports of pulp in 1905 had a value of only \$29,704, showing the remarkable increase as an article of export since that year.

Newsprint likewise shows a notable increase, which was exported to the value of \$211,616 in 1911 as against \$173,561 in 1910, giving an increase of over \$38,000.

Rough lumber on the other hand shares the fate of pulp-wood, as the exports of this article fell off from \$723,288 in 1910 to \$616,261 in 1911, or more than \$100,000. Clapboards were not exported at all in 1911, but the exports of deals slightly increased over 1910, showing a value of \$74,822 in 1911, as against \$72,950 in 1910. The exports of laths likewise show an increase of \$15,700 for 1911, but those of shingles a decrease of \$27,724, as do likewise railroad ties, which fell from \$29,895 in 1910 to \$21,672 in 1911.

As a general conclusion it may therefore be stated that the exports from this district of the manufactures of wood show the greatest increase, while those of the raw material or semi-manufactured articles show a decreased exportation.

The total of these exports for both years remains stationary.

Following is a comparative statement of the declared exports of lumber from the United States Consular District of Quebec during 1910 and 1911:

Articles	1910 Value	1911 Value	1911 Increase	1911 Decrease
Balsam fir . . . .	7193.33	2259.55		4933.78
Clapboards . . . .	4065.40			4065.40
Deals . . . . .	72950.72	74822.13	1871.41	
Laths . . . . .	36975.48	52696.45	15720.97	
Paper, newsprint	173561.46	211616.14	38054.68	
Pulp Wood . . . .	1702644.71	1290500.48		412144.23
Wood Pulp . . . .	765131.34	1273868.68	508737.38	
Lumber, rough . .	723288.10	616261.73		107026.37
Railroad ties . . .	29895.97	21672.85		8223.12
Shingles . . . . .	38264.15	10539.48		27724.67
Totals . . . . .	\$3553970.66	\$3554237.49	\$564384.40	564117.57
<b>Total Exports, Quebec</b>				
	1910			1911
Forest Exports . .	\$3,553,970.66	Forest Exports . .	\$3,554,237.49	
Miscellaneous . . .	1,339,580.11	Miscellaneous . . .	876,091.44	
Total . . . . .	\$4,893,550.11	Total	\$4,430,329.44	

### Montreal Lumber Trade Looks Promising

Montreal wholesale firms report a good year's trade during 1911, with a large amount of lumber going into consumption, particularly of common spruce and pine. New Brunswick spruce competed keenly with spruce from the province of Quebec, with the result that prices inclined to be easy. Quotations in pine however, held fairly well throughout the year. Present appearances point to a slight stiffening in prices, owing to the low water during the past summer. Stocks at the mills too, are low; and although there is a fair quantity of dry lumber on hand in Montreal, when the demand again sets in there will probably soon be a shortage. In one or two lines it was complained that owing to excessive competition, it was hard to get even a moderate margin of profit, but even here a rise in values is looked for.

The hardwood trade picked up very well. The local demand for birch—especially birch flooring—was very good, and in some instances stocks were kept for home use instead of being exported. During the past five years the position in this wood has been reversed, and the domestic consumption is now greater than that for export.

Both in soft woods and hardwoods the outlook for the current

year is very bright, not only for increased requirements but also for higher prices.

The outstanding feature of the export trade from the port of Montreal was the continued decline in the quantity shipped. The total of 103,473,220 feet B.M. showed a falling off of 14,408,373 feet B.M., the reduction being chiefly in pine. The predominant factors in the market were increased competition from the Baltic and the labor strikes in Great Britain. White pine formed about 75 per cent. of the exports, and not being subject to Russian competition, prices held firmly pretty well throughout the year; red pine, on the other hand, met large shipments from the Baltic, with the result that quotations inclined to give way. The Russian descriptions were imported into Great Britain at a lower cost than the Canadian wood, and naturally the tendency was to force prices down.

Another feature of last year's trading was the large quantity of cheaper grades shipped. This was due to the higher level of quotations ruling in Canada for white pine, particularly for the best grades; British consumers apparently were not prepared to pay these prices, and in consequence bought lower qualities.

Prices for hardwoods were easy during the summer, but they strengthened in the fall, largely in sympathy with the rise in freights. The shipments of birch increased. The spruce market was, on the whole, of a rather shaky character.

The great disturbing influence was the strikes in Liverpool and other British ports. They completely upset the arrangements of the shippers, who were unable during the balance of the season to bring affairs back to their normal condition. Though the general tendency is for exports to decrease from the port, last year's decline was in a large degree attributable to the impossibility of getting shipments away during the latter part of the season.

As far as can be judged, the outlook for next season is not particularly cheerful. This is owing to a threatened big increase in freights by the steamship companies, whose agents are talking of a stiff addition to charges. These rates would have to be, in turn, added to the cost of lumber, and exporters, who have to meet the world's competition in the British markets, fear that, if the freights increase to any appreciable extent, trade will be considerably curtailed. Last year freights on deal ends were put up, and instead of a two-thirds rate, shippers had to pay full charges, with a consequent decline in this part of the lumber business.

Complaints were made during the year as to the accommodation at the harbor, the exporters stating they have not sufficient room to handle the lumber expeditiously and economically. The railway companies have been able to reduce the cost of dealing with goods at the dock by 50 per cent., in consequence of being afforded greater facilities, but the lumber companies find their expenses of shipping largely increased on account of their conveniences being curtailed. This, in addition to the car shortage practically throughout the season, made the work of shippers more than usually difficult.

Mainly owing to the extensive building operations, the retail demand for lumber in Montreal during the past year was exceptionally brisk, there being a good general demand for all descriptions. At the commencement of the season heavy stocks had accumulated, and those were gradually reduced owing to the large sales. Competition, however, was very keen, and prices were closely cut; but, taking the year as a whole, firms had very little to complain of. In one or two special lines trade was rather dull towards the end of the season, but there were exceptional reasons for this slackness. The comparatively mild weather of the winter allowed building operations to be carried on until a late date, and this stimulated the demand for all kinds of lumber.

There is general optimism as to next season. This is founded on a belief in the continuance of the industrial expansion and the knowledge that many new large buildings and also residences are contemplated. Stocks, too, are lower, and under these circumstances an advance in prices is not unlikely.

### Exports from Montreal

The following is the statement of shipments of wood goods by leading exporters from the Port of Montreal during the seasons of 1911 and 1910:

	Feet 1911	Feet 1910
Watson & Todd, Limited . . . . .	30,663,444	34,684,863
Robert Cox & Co. . . . .	13,296,102	20,181,398
W. & J. Sharples . . . . .	10,222,326	11,014,202
J. Burstall & Co. . . . .	9,334,797	10,501,571
E. M. Nicholson . . . . .	9,134,954	8,659,361
E. H. Lemay . . . . .	7,208,343	8,341,101
Dobell, Beckett & Co. . . . .	4,930,711	3,640,841
Cox, Long & Co. . . . .	2,431,104	2,448,189
Railway, Steamship Lines and Small Shippers . . .	16,251,439	16,883,870
Total . . . . .	103,473,220	116,355,396
Shipments, 1910 . . . . .		116,355,396
Shipments, 1911 . . . . .	103,473,220	
Shortage . . . . .		12,882,176

# The Year's Trade in New England

Too Much Politics for the Good of the Trade—General Business Conditions Healthy—The 1912 Outlook

By H. B. Shepard, President of Shepard and Morse, Boston

We have found during the past year that business has been considerably injured in this section of the country, owing, we think, quite largely to the political agitation centering at Washington, also to the activity of the Attorney-General and his assistants in prosecuting cases against the various large combinations of capital in our country. Notwithstanding the fact that our general business conditions have been good and healthy, that crops have been quite satisfactory, taken as a whole, and that there is quite a natural growth in New England, as elsewhere in the United States, nevertheless the tendency to expand, which naturally helps to make an active demand for lumber, as well as for other commodities, seems to have been entirely lacking during the past year, we think largely because these large combinations of capital have not felt at all like extending their business or branching out into new lines in any way.

We have found of course, a good, fair, steady demand for lumber, and when we look over last year's business as compared with that of the previous year, we think as a whole the volume will compete favorably. At all events there is very little falling off in the amount of business done, still in many cases prices have shown a tendency to sag somewhat and competition has been sharp, and we think lumbermen as a rule feel that the percentage of profit this last year has not been what it should, as it needs some expansion of business and a little more demand than supply, to allow the general lumberman to obtain a good fair profit, and this extra demand has been entirely lacking during the past year.

## Eastern Shingles Had a Good Year

Of course, there have been exceptions to this rule, for instance eastern cedar shingles, which were selling very low in 1910, advanced considerably in price in 1911, and the supply has been hardly up to the demand. This is largely explained by the fact that shingles were so plentiful in 1910 that many people curtailed their output or did not manufacture at all, and when the price began to advance in 1911 it was rather too late to increase the output materially, consequently we have seen an advance during the past year of 25 and 50 cents per thousand on eastern cedar shingles.

On the other hand, shingles from the western coast, mostly from the State of Washington have been plentiful, whereas it has been customary to obtain 25 cents per thousand more for the western coast red cedar shingles in this market, than for the eastern white cedar shingles, this year we have seen just the reverse. Red cedar shingles have been selling probably from ten to twenty-five cents per thousand less than the white cedar, very largely because the large duty now in force against Canadian shingles almost entirely shut off the supply from British Columbia, and the knowledge that this was likely to occur stimulated the shingle manufacturers in Washington to increase their output, and they have very much overdone that class of business, with the result as stated.

Also eastern spruce lumber has been in good demand, and during the past year there has been no surplus supply, consequently prices have ruled high, as compared with the general average price.

## Improvement in White Pine Lower Grades

The supply of white pine box boards in the east has seemed to have been very heavily drawn upon, and the supply is virtually exhausted, and as this condition also prevails through Minnesota and Wisconsin and that section of the country, the demand for Canadian box lumber has been largely increased and prices have advanced from one to two dollars per thousand in that commodity during the past six months. We think the Canadian lumbermen during 1910 accumulated a very large quantity of the lower grades of white pine, which were reduced several dollars in price and still could not be marketed. This year, owing to the conditions above stated, they have been able to market a very large portion of this surplus common lumber in the United States, and at better prices than they could in 1910. The better grades of white pine lumber have held their own during this past year with slight advances, in fact looking back for a number of years, there has hardly ever been a time when the white pine higher grades of lumber have slackened in price, and in most years they have shown an advance which has not weakened but which seemed steadily to increase from year to year.

Conditions this winter seem to show a fair volume of business, comparing favorably with previous years. The weather has been such that business has not been checked until the last two weeks by any cold or bad weather, and we think the sales will average well as compared with 1910, still there is no life, or jump, or snap

in it, and no chance to obtain a good margin. Everyone is held down close to cost in marketing their goods.

Southern pine, of the lower grades, has been in good demand for the past six months, and the price has gradually increased and shippers of roofers and other coarser grades have been filled with orders, and could not make shipment promptly. This has helped also the situation of coarse lumber in Canada. In making inquiries of different lumbermen, we find there is a general feeling of being fairly satisfied with conditions, but a disappointment that margins have not been better.

## The Outlook for 1912 Trade

We think the feeling for the coming year is not probably optimistic, although we do not believe lumbermen in this section expect any drop in prices in any of the staple commodities, unless it might be in some articles of which there was a large supply with small demand.

It would seem the financial community is feeling the same, because money conditions are very easy in this section, and money is freely loaned on six months time, and even a year in some cases at nearly the lowest going rates which are asked for shorter periods, and evidently bankers do not expect great activity for the coming year which would call for large amounts of money, thereby largely increasing its value.

We, however, fail to find anyone who feels that we shall have a particularly bad business year, or that there will be any falling off from the amount of prosperity we have been favored with during the past year, but until Congress has shown that it is going to deal reasonably with the tariff, and so handle trust legislation that the large interests may feel that they can safely expand without danger of further prosecution by the government, which would be brought about by a clearer definition of the anti-trust laws and the laws pertaining to interstate commerce, we hardly think that any expansion in business will take place, and until our next presidential election is over, and the business community in general becomes satisfied with the result of this election, we think we must expect to continue about as we have for the past year or two, without any great change.

After these matters are satisfactorily settled, we can see no reason why the country should not enter upon another era of prosperity, with increased business, and advanced prices, both in commodities, and stocks and bonds, which would tend to make everyone feel more prosperous and contented than they are at the present time.

## Timber Measured at Quebec During 1911

The following comparative statement of timber, measured and culled at Quebec during 1911 is furnished by the Supervisor of Cullers' Office:—

	1909 Cubic Feet	1910 Cubic Feet	1911 Cubic Feet
Waney White Pine . . . . .	738,840	541,440	964,440
White Pine . . . . .	57,520	10,720	10,680
Red Pine . . . . .	8,680	21,920	27,720
Oak . . . . .	568,960	256,680	133,280
Elm . . . . .	108,080	246,920	221,680
Ash . . . . .	520	1,400	120
Birch and Maple . . . . .	60,840	44,400	71,560
Square Hickory . . . . .			120
Total . . . . .	1,543,440	1,123,480	1,429,600

## Remarkable Pulp Development

When it is stated that more money was invested last year alone in Canadian pulp, paper and lumber concerns than in the whole of the previous ten years, one can form some idea as to the marvellous development that is taking place in connection with the resources of our forest, says the Quebec Chronicle. During the year 1911, a sum of no less than \$123,000,000 was invested in these industries, as a result of fifty-nine incorporations. Of these, forty-nine were new companies, with a capitalization of about \$90,000,000. Besides these, ten old companies increased their capitalization or were re-incorporated. These represented a capital of \$33,000,000. We do not believe that so large a sum was invested in any of the other great national resources of the Dominion.

## Canada's Pulp Exports

The United States government returns for the eleven months ending November 30, 1911, state that during that time the States imported from Canada 100,553,642 pounds of paper, valued at \$1,876,843, while the importations from other countries only amounted to 9,000,000 pounds. In wood pulp they imported a total of about 493,000,000 pounds, an increase of nearly 50,000,000 pounds, over the previous year, and over 150,000,000 above the figures for 1909.

## Newfoundland Lumbering in 1911

### Two Large Companies Manufacturing for Export—Pulp and Paper Output being Doubled— Outlook Promising

Two mills only were operating lumber in Newfoundland to any large extent for export in 1911,—The Newfoundland Pine & Pulp Company at Point Leamington, cutting approximately 5,000,000 feet; and The New Lands Lumber Company, at Norris' Arm,—also about 5,000,000 feet. The next largest mills are operated by the Horwood Lumber Company of St. John's, N. F., at Dog Bay and Campbellton,—whose combined output would be around 4,000,000 feet annually, which is consumed in the home trade. There are some hundred of smaller mills all around the coast, but no other large operation.

Some ten years ago Mr. Lewis Miller, a Scotch lumberman, built immense mills at Millertown and Glenwood, but he did not operate long before he sold out to the Newfoundland Timber Estates, Ltd., who remained in business for a few years, when they sold their largest property to the Anglo-Newfoundland Development Company, Ltd., The Harmsworth London Co., for a pulp proposition. This latter company started operations in connection with their pulp and paper mills at Grand Falls in 1909, and have cut annually about 60,000 cords of spruce and fir for consumption in their mills. Last year the cut was doubled, owing to the fact that large extensions, which mean considerably increased output of pulp and paper, were being installed; and from 1912 onwards they will cut 130,000 cords of pulp wood annually. The production of the mills at Grand Falls, so far, has been as follows:

	Pulp	Paper
1910.. . . .	22,000 tons, wet.	20,000 tons
1911.. . . .	26,500 tons, wet.	28,000 tons
1912, Est. . . .	33,000 tons, wet.	36,000 tons
1912, Est. . . .	33,000 tons, wet.	60,000 tons

at which rate of production it will probably settle down as a regular output.

The other pulp proposition at present in Newfoundland is operated by the A. E. Reed Company, Ltd.—also an English company—whose plant is at Bishop's Falls, some twelve miles below Grand Falls on the Exploits' River. They started manufacturing in February, 1911, and their production for 1911 was 20,000 tons wet weight, which will be increased to 60,000 tons, wet weight, in 1912 and the future, annually. They will consume some 30,000 cords of spruce and fir annually.

Rumors of other pulp mills are being talked of—one on the Gander River, and another on the Humber River on the West coast. No doubt in another generation there will be many more such mills constructed, for the country is rich in spruce which has been proved to furnish the best quality of pulp-wood. Though the size of the wood is small, the quality is excellent, the largest diameter averaging twelve inches, and the general run of the wood averaging 6 to 10 inches. The pine of the country runs up to 30 inches diameter, but the average is around 18 inches, and there is a fair proportion of pine in some parts of the Island.

## Newfoundland Enjoying Prosperity

### Local Consumption of Lumber Greater than in Any Previous Year—Fisheries Brought Good Times to Trade

By R. F. Horwood

Newfoundland enjoyed great prosperity in 1911, the revenue being in excess of any former year, and the trade conditions generally, being very satisfactory.

The trade of this Island depends largely upon the ocean harvest, and Neptune was very kind to the oldest colony during the past several years, but particularly in 1911. The cod fishery is the principal source from which the colony derives her revenue. Not only did the sea yield its harvest ungrudgingly, but the colony's competitors were at a disadvantage in 1911, the Norwegian supplies being small and badly cured, and the colony's active French competitors being almost out of the race. These prosperous conditions in Newfoundland are largely due to the strict enforcement of the Bait Act, a weapon which the Government has been using for the past ten years, or more, and which has almost paralyzed their competitors, especially the French and American fishermen. The bank fishery depends almost entirely upon Newfoundland bait, and the Newfoundlanders have come to realize that in this matter they hold the key of the situation, and are using it. There are small stocks of fish now for the Colony to market, the greater part of the catch for 1911 having been sold most favorably.

The conditions detailed, of course, re-act upon the lumber business, and as a consequence the local consumption of lumber for 1911 was probably the largest in the history of the colony. No adequate figures are available, however, to tabulate what is the actual consumption locally. The export of lumber is but small, the largest in any year not exceeding 20,000,000 feet, and this goes mostly to the Argentine Republic. Prices on most grades of lumber advanced locally from \$2 to \$4 per M. during the year 1911. There has been an upward tendency in prices for some years, but only slightly discernible until the past year. The Colony affords no opportunity for largely exploiting the lumber business, as there is no workable group of timber anywhere that will warrant a large outlay for manufacture. Pine grows in scattered conditions among spruce and balsam (known locally as fir), the latter trees not attaining any large size. In an endeavor to make lumber in large quantities at various points during the past ten years a great deal of money has been lost in Newfoundland, and it is not likely that any other attempt will be made to manufacture lumber on a large scale. Newfoundland will never be a lumber exporting country to any extent and in the view of some people, the time is not far distant when she will be an importer, due to the fact that much of the timber land in the country is being used for pulp production. The outlook is that much more will be so utilized in the near future.

The timber of the country lends itself admirably to the manufacture of pulp, and Newfoundland pulp has attained an enviable record for quality in European and United States markets. Two large pulp mills are already in operation, with a combined output of 350 tons per day. Other smaller mills are in course of erection, or in contemplation. In connection with the Anglo-Newfoundland Development Company's plant a paper mill has also been established with a capacity of about 200 tons per day. This latter pulp and paper mill is one of the largest in the world, utilizing about 15,000 h.p. at present.

The winter set in very severe in Newfoundland, and it is not an easy country in which to lumber, as the climatic changes are very abrupt. The lumberman can never depend upon his roads, and frequently large falls of snow cause him expense. It is not unusual for a sudden thaw to take place in the middle of winter with a resulting flood that hangs up everything for a time. Logging is being pushed vigorously, both for pulp and lumber purposes, but the output of lumber will probably not be as large as in former years, as some of the large mills have closed down.

### Prosperous Year for Newfoundland

The past year was the most prosperous in the history of Newfoundland. The total imports and exports for the year amounted to \$25,359,000, as compared with \$22,500,000 last year. The pulp and paper industry proved so satisfactory that the companies now operating in the island have decided to further enlarge their plants. The Harmsworth Company is now building a second paper mill, which will make this establishment the largest in the world, and when this is completed early in 1912 their present output will be doubled. The Albert Reed Company are also enlarging their plant so as to double its capacity. They are also planning to begin the construction of a paper mill during 1912.

Another English concern has acquired large timber limits near Bay of Islands, on the west coast, paying upward of \$500,000 for the property. At the present time they are negotiating with the Government to secure water powers which will enable them to operate pulp and paper mills.

The export of pulp and paper for the fiscal year which ended June 30, was \$1,500,000, or practically the same as the mineral exports of the island for the past year. A feature of the pulp and paper industry is that numbers of the fishermen are given employment in the forests and mills during the winter months when previously they were idle.

Undeveloped as the colony is in comparison with its dormant resources, the prosperity in recent years compares favorably with the progress made in any other part of the empire. In a period of ten years Newfoundland increased its trade by 115 per cent.; its lumber and mineral output nearly trebled; the revenue was doubled; and the population advanced by 10 per cent. A loan of nearly £1,000,000 is in course of expenditure by the government on branch railways, and in every direction—commercial, industrial and administrative—vitality and enterprise are abundantly evident.

### A Linderman "Dovetale"

The Canadian Linderman Company Limited, Woodstock, Ont., have prepared a unique souvenir which has been sent out to their friends. It is in the form of a dainty booklet in brown cover with a colored illustration of the taper wedge dovetail produced by their machine. An attractively printed folder is included in an envelope which is attached inside the book. The whole is neatly put up in a brown mailing folder and is entitled "A Dove Tale." This little remembrance of their friends in the trade will serve forcibly to bring home the fact that everything which the company produces is unique, both for its excellence of material and for the splendid manner in which it performs its work.

### Illustrated Shoepack Catalogue

A. C. Todd, of Meaford, Ont., has just issued an illustrated catalogue showing complete lines of his well-known "Polar Bear" Brand of Oil-tanned Shoepacks. Mr. Todd has earned a reputation in the manufacture of leather during the past thirty years which assures the shoepack trade of the excellence of his goods.

# The Prairie Lumber Trade During 1911

Remarkable Invasion of United States Products Caused Widespread Price Cutting  
—Lateness of Crop Caused Tight Money and Poor Trade—The 1911 Outlook

The year 1911 was a most remarkable year in the lumber trade of the prairies. Viewed from the standpoint of the wholesale dealer in home products and the manufacturer of lumber, the year was not a prosperous one. In retail circles the volume of trade was greater than ever before but in a financial sense the year was far from a favorable one. Prices ruled considerably lower than the average, the manufacturers to the east and west of the prairies finding it necessary to cut prices to a most unprofitable extent owing to the low schedules quoted by the importers of sawed lumber from the United States. The result of these circumstances was a most unsettled condition of the markets, particularly in the larger centres.

Competition in the lumber trade has been quite as keen as ever before, despite the great increase of the scope of the market and the increasing opportunities to sell lumber. In a few cases price wars were carried on for short periods in some of the smaller towns. There has been little real competition from mail-order houses although country dealers have been obliged in many cases to cope with quotations from such sources. The results have been more in the nature of inconvenience and trouble for the yard-man than any material loss of business. Generally speaking, little difficulty has been experienced in selling lumber in the face of the figures submitted by the mail-order houses.

A feature of the year has been the rapid increase of sales territory on the prairies due to the large number of new branches of the railroads which have been opened for traffic. The line-yard companies have shown their ability to keep abreast of the development in this line as the prompt opening of one, two or three yards in even the smallest of the new towns will testify. The number of new yards opened has been very large.

## Crop Situation Affected Trade

The outcome of the crop situation had a most depressing effect upon the lumber trade, which in common with all other lines of business in the west hinges upon this issue. The grain was several weeks late in ripening, the threshing season, late as it was, was very unfavorable and the cold weather of mid-November all tended to make up a most unfavorable situation. The railway facilities proved entirely inadequate to the task of moving the grain with even a reasonable promptness, and the result has been financial stagnation in the lumber trade. At no time for a number of years have country collections been so unfavorable as during the latter three months of 1911. The inability to move the grain and get the returns for it has left the farmers in a position where, as a rule, they are unable to buy more lumber or to pay for what they had bought earlier. Money for this reason was very tight throughout the entire fall season and these arduous conditions are now only commencing to grow easier.

The year 1911 had many favorable elements bearing upon the trade in general and the prairie trade in particular. Immigration was heavy, building in all lines in the cities was very brisk, and railroad expansion was all that could be desired,—these and other conditions all tended to make the year a prosperous one but the unusual combination of circumstances in connection with the crop brought the year to a close in the midst of conditions that could only be called unfavorable.

## Retail Trade Had Active Year

A redeeming feature of the situation throughout the year was the activity of retail trade in the cities. The activity was most noticeable in the larger centres, such as Winnipeg, Regina, Calgary, Saskatoon and other rapidly growing cities and towns. Building at such points has been very active and retail buying of lumber consequently very brisk.

The year 1912 opens with the tide of favorable conditions setting strongly toward it and there are strong probabilities that the setting in of the less rigorous weather will mark the beginning of a season of great activity and better values. The prophecy is being freely made that the spring will develop the heaviest demand that the prairie trade has yet experienced. The probabilities as to better prices are founded chiefly upon the upward tendency of prices in the markets of United States, particularly on the Pacific coast, from which sections most of the shipments into the prairies are made. As there is no doubt that the low values existing in those markets have governed the prairie trade, so it is apparent that any increase in values in that direction will have immediate and similar results upon the prairie business, as there is no doubt that the Canadian

manufacturers are anxious to cease the slaughter methods to which they have been obliged to resort to meet the American competition.

The circumstances upon which is founded the forecast of an exceptional activity in the prairie trade are summed up in the statement that the business of two seasons will be crowded into one. It was confidently expected that the autumn of the year just ended would see a considerable activity, that there would be a brisk demand and that, not only would a great deal of the business be on a cash basis, but that the country buyers would wipe out a great volume of the accounts standing on the books of the retail dealers. No such conditions materialized. The crop was late in ripening by several weeks and the winter setting in very early, there was no time for building. It might then be said that, as far as the country business is concerned, there was no fall trade in lumber. The farmers were so late in receiving returns for their grain that money was more than ordinarily scarce until well into December. In every sense the fall season might be described as a more than ordinarily unfavorable one.

## Good Outlook for Building Trade

It is therefore apparent that the building, which under ordinary circumstances would have been done during the fall, remains yet to be done. It is safe to say that much the greater portion of it will not be started until March, although the yards will no doubt begin to stock up before that time in expectation of the spring business. It is also apparent that in addition to the building which has been left from the fall, there will be the great volume of building which the spring months is bound to develop under ordinary conditions. Adding the two together, it will be seen that the prairie country's needs in the way of lumber will reach the highest mark and will make the most prosperous and most active spring season yet experienced in the retail and wholesale trade.

In a financial sense, the outlook is quite as bright and much the same conditions govern. The crop was a good "money crop"—while the grade was of a low average, good prices reigned and the net result of the crop in dollars and cents has been quite up to the average. The country buyer will spend the money in the spring which he would have exchanged for lumber last fall had conditions been different.

All existing conditions in the prairie trade therefore have a favorable tendency in the direction of a heavy demand and a large volume of collections. Immigration, it is confidently expected, will reach proportions which will surpass the great records established in earlier years. The railway expansion of the past year is a most important factor in figuring the prospects for the trade of 1912. Much new territory with its possibilities for trade has been opened up in 1911 and even greater in extent will be the new country which the new lines and branches will open to the yardman during 1912. There is every indication that building in the cities and other large centres, temporarily quiet because of the cold weather, will be resumed with the breaking of the winter season on a greater scale than ever before. These three elements, added to the conditions outlined in former paragraphs of this article, present an array of facts and circumstances which give every justification for pronounced conditions except under stress of the most unusual events.

## Increasing Output of Prairie Province Spruce

One of the features of the year 1912 will be the more prominent part taken in the prairie trade by the spruce from the woods to the north of the prairies. Two of the largest mills in the west, that of Big River Lumber Company, at Big River, Saskatchewan, and Henry Finger's mill at The Pas will both be sawing for the prairie trade. The spruce from this section is year by year becoming more important in a trade sense.

While the Canadian Northern has opened up a country which is well timbered, the largest and most important timber tracts lie still farther to the north. Much of this territory is still unknown to the timber cruiser and all the lumbering so far done has been the getting of enough logs to supply a few small portable mills. While the total product of the sawmills of the three central provinces is not large when compared with the output of the British Columbia mills, nevertheless the output is considerable. Some idea of the importance of the sawmilling industry in the provinces of Manitoba and Saskatchewan may be gathered from the estimates of the output in 1910 of the sawmills in the northern sections by men

actively engaged in the business, and who are familiar with conditions. The total amount of this output was placed at two hundred millions of superficial feet. It is safe to say that the output in 1911 was twenty-five to thirty per cent. greater and that the output of 1912 will practically double that of 1911.

There are prospects of a greater development in the way of lumbering in the Rainy River Country. The Shevlin-Clarke Company built an up-to-date plant at Fort Frances in 1911 and there are rumors of large projects of a similar nature soon to materialize.

### A Good Outlook for 1912 Trade

One of the largest lumber manufacturers in the province of Saskatchewan reports upon the trade of 1911 as follows:

The volume of trade during the year 1911 was greater than during 1910 and profits were better, as a result largely of the increased output. The better grades sold for higher prices during 1911 than during 1910. Stocks of ordinary spruce on hand were a little heavier at the end of the year than a year previous. The markets for shingles and lath were good. The prospects for 1912 seem promising but no one can foretell them exactly, as unfavorable conditions may develop later on. Stocks at present are low in the retail yards. Farmers are expected to have a fair amount of money for building purposes when the season opens. It is also expected that heavy immigration will cause a good demand for lumber both in the cities and in the country.

Another firm in Saskatchewan, manufacturing some 50,000,000 feet of lumber annually reports that the volume of their trade during 1911 was somewhat less than during 1910, by an average of about \$3 per thousand feet. Stocks at the end of the year were heavier than a year previous. The market for shingles and lath was good. The outlook for the lumber trade during 1912 was considered fair.

An important lumber manufacturing company in the province of Manitoba reports that the volume of trade during 1911 was about the same as in 1910 and the profits also were on the same level. Wholesale prices are reported to have decreased during the fall. This company closed the year with their stocks practically all sold out and report that lumbermen in their province are reducing their outputs of logs, because the Rocky Mountain and Pacific slope manufacturers are still slaughtering their surplus stock into Prairie Provinces. Retailers however, are reported to be still maintaining their prices throughout most of the west.

A well-known Alberta firm of lumber manufacturers state that during 1911 the volume of their trade was greater than during 1910 and that their profits were better. They experienced also a better demand during the year and closed it with a very low stock. They considered the outlook for 1912 to be good, and report that the demand for lumber seems to be on the increase.

### Alberta's Vast Pulpwood Resources

The pulpwood resources of the province of Alberta attracted considerable attention during the year 1911 and the opinion was generally developed that as soon as facilities of transportation are provided the province of Alberta will become one of the important pulpwood producing provinces of Canada. Large areas of the province along the western boundary and scattered sections generally, over the northern two-thirds of the province, are covered with stands of white and black spruce, Englemann spruce and Jack pine, tamarac, aspen poplar and cottonwood, all of which are adapted for the manufacture of woodpulp. The "Pulp and Paper Magazine of Canada," in a special article dealing with this subject states that the whole country is well watered with large and small lakes and rivers and practically all the timber is near enough to some water course to be accessible. Every district moreover, has sufficient water power capable of development for pulp manufacturing purposes. The lack of transportation facilities is the great obstacle in the way of immediate development. Large areas of this pulpwood moreover are outside of the present leases and therefore unalienated from the Crown, which has adopted, during the past four years, a policy of leasing timber only to those who are prepared to carry on actual operations. The whole territory has been remarkably free from fire and there are practically no untimbered burns or prairies on the whole watershed surrounding Lesser Slave Lake.

The Forestry Branch of the Department of the Interior has had two parties out examining this territory, during the past summer and their reports will be published in the near future.

### Increasing Imports of United States Lumber

Some idea of the enormous increase in the imports of lumber from the Pacific Coast of the United States into the Prairie Provinces of Canada may be gathered from the statistics recently issued, by A. W. Cooper, secretary of the Western Pine Manufacturers' Association. A total of 6,586,636 feet of lumber was shipped across

the border into Canada during the month of November, 1911, as compared with 594,237 feet during the month of November, 1910.

### Saskatchewan's Lumber Industry Expanding

Specially Written for the Canada Lumberman

Lumbering and wood-working generally forms one of the leading industrial pursuits of Saskatchewan and probably ranks next to agriculture in the ranking of leading industries. While actual figures of the total cut of lumber for the year 1911 are not yet available, a conservative estimate places the amount at well over 100,000,000 feet board measure. In the year 1910, the mills of the province numbering 22, cut 75,931,000 feet board measure, valued at \$1,092,571. A number of small mills have been both opened and shut down during the year, but all the larger mills have been in operation and report an increased production ranging from 8 to 20 per cent. over the previous year.

The Big River Lumber Co. erected a new mill at Crooked Lake. This mill, it is estimated, has a capacity of half a million feet of lumber and 60,000 lath per day and employs upwards of 350 men.

During the year 1911, three large planing mills or sash and door factories commenced operations in this province. These concerns, namely, The Craftsmen Ltd., Regina; Messrs. Cushing Bros., Saskatoon, and Western Manufacturing Co., Moose Jaw, have a total invested capital of \$210,000, and an estimated annual output valued at over \$425,000. These three mills are all of this year's development, and are in addition to some 15 planing mills in operation during the year 1910. A feature of the work of these mills and one which tends to illustrate the development of the province is the fact that the total annual output of all 18 mills which is valued at about \$1,110,000 is totally consumed within the province. Nor is this supply equal to the demand, for many large orders of the year 1911 are at this date yet unfilled, and one planing mill at least, employing about 85 hands, is at present running a double shift working night and day in an endeavor to keep abreast with its orders. In addition to the output of these mills, there is of course, considerable finished wood work brought into the province from the large mills of the east and west.

Several towns of the province are advertising openings for planing mills and no doubt some of these places offer excellent opportunities for the establishment of paying wood-working industries.

Taken as a whole the year 1911 was one of great development and expansion in the wood-working trade of this province, and the future is decidedly bright for those engaged in any way in the production of any class of building material.

An appropriation of \$355,000, an increase of 100,000, for the protection of timber in Manitoba, Saskatchewan and Alberta, the Territories and the British Columbia Railway belt is included in this year's Dominion Government estimates.

Owing to increased business in the west, The Garlock Packing Company, of Hamilton, Ont., have opened branches in Winnipeg and Vancouver, where a complete stock of Garlock packings and mill supplies will be carried. The Winnipeg branch is located at 117 Market street, with Mr. W. J. Usher as Western Manager, to the Mountains. With Mr. Usher are associated Mr. B. E. Dalzell and Mr. E. C. Medland. The Vancouver branch is under the management of Mr. Arthur R. Bell, who will be assisted by Mr. George Cook.

### Personal News of the Lumber Trade

C. MacRae, of the Alberta Lumber Co., Vancouver, B.C., paid an extensive visit to Toronto and other Ontario points during the last two weeks of January.

At the annual meeting of the Sherbrooke County Liberal Association, Mr. F. N. McCrea, M.P., president of the Sherbrooke Lumber Co., was elected honorary president.

Mr. Carl Riordon, managing director, and Mr. Charles Read, secretary-treasurer of the Riordon Paper Company, Limited, Montreal, left New York on the Olympic on Jan. 24 for England.

Mr. A. G. Rolston, formerly with the Hugh McLean Lumber Co., Buffalo, has been appointed representative in Ontario for the Goodyear Lumber Co., Buffalo. Mr. Rolston will be located for the present at No. 1 Herman avenue, Toronto, and will make frequent calls upon the trade in the interests of the Goodyear Lumber Company's short and long leaf yellow pine. The Goodyear Company are also extensive operators in Mexican sugar and white pine.

Exports of lumber from the United States Consular District of Kingston, Ont., were valued at \$83,018 during 1911, and \$19,131 during 1910.

### British Columbia's Lumber Output

Last year's output of lumber from the mills of the interior or mountain district of British Columbia is estimated by a competent authority at approximately 300,000,000 feet.

About 90 per cent. of this lumber was shipped to the prairie provinces of Alberta, Saskatchewan and Manitoba, the balance being absorbed by local consumption and by a few shipments to Europe.

The industry suffered greatly owing to a lax interpretation of the Canadian tariff on imported lumber. It is generally believed that this condition will be remedied by a recent ruling of the Minister of Customs who has declared that the tariff must in future be enforced strictly.

The enormous grain crop of the prairies last year in conjunction with the ruling of the Minister of Customs which will reduce American "dumping" is expected to result in a notable increase in this year's production from British Columbia mills.

Official statistics of the cut of lumber during 1911 are not yet at hand but the estimate given above would mean a reduction of 125,000,000 from the output of 1910.

### B. C.'s Timber Revenues Well Maintained

The statistics of the timber branch of the Provincial Department of Lands have been completed for the year 1911, and show the revenue of the branch to have been well maintained, approximating a little over two million dollars for the year just closed, as it did also during the years 1910 and 1909. During the past twelve months, a number of licenses lapsed, and the lands which were covered by them have thus become available for settlement and colonization.

Increases are noted in the receipts through the transfer of timber and coal prospecting licenses, and under the head of penalties, transfers of such charter having produced during 1911 no less than \$13,199, and penalties \$18,625. The total timber branch revenue for the province for 1911 amounted to \$2,297,452.25. The reports of the supervisor of log scalers shows 619,372,000 scaled at Vancouver alone in 1911.

### To Reduce Fires Caused by Locomotives

The department of lands of British Columbia has made an application to the Dominion Board of Railway Commissioners for an order "regulating the operation of locomotives with regard to the spreading of forest fires upon adjacent lands in the dry season of the year." The hearing has been set to take place in Ottawa on Feb. 6, at 10 o'clock. It is not a question of obtaining damages so much as of stopping the destruction of forests altogether which will be dealt with. Last year, under the recommendation of the committee on forests of the commission of conservation, a clause was added to the Railway act placing the burden of proof in connection with cases of damage, upon the railway companies, and making them pecuniarily responsible. It is under this act that the railway commissioners will deal with the application. It is understood that the suggestions made by the British Columbia department of lands will be either that in the dry season the railways take greater precautions, or that they be asked to install oil-burning locomotives.

The Dominion Sawmills & Lumber Company, whose head office is at Calgary, Alta., expects to produce during 1912, 125,000,000 feet of lumber. They have already more than 35,000,000 feet and have 1,000 men in the woods. Arrangements are now being completed which will enable them to ship into the three prairie provinces during the coming season, 30,000 cars of lumber aggregating approximately 75,000,000 feet. I. C. Smith, formerly of Vancouver, will be general sales agent for the three prairie provinces with headquarters at Calgary.

### Reports Upon British Columbia Trade Conditions

A good idea of the conditions prevailing during 1911 in the British Columbia lumber trade may be had from the following extracts from reports received by the Canada Lumberman.

Regarding trade conditions during 1912 various reports from British Columbia firms are as follows:

"The volume of trade was less and so were the profits. Prices were lower than in 1910. Stocks are lower now than a year ago."

"The volume of trade was greater and profits were practically the same. Prices showed little change. Stocks are lower than a year ago."

Ross-Saskatoon Lumber Company, Waldo, B.C.: The prospects for 1912 are still an open question, but the outlook seems fair although prices are uncertain.

"The volume of trade was a little greater. Profits were less because the United States mills were cutting. Prices were lower. Stocks are now about the same as a year ago."

An important Mountain manufacturer: I would prefer at this time to refrain from making any statements regarding the lumber business, as in

doing so I would have to say that in Western Canada we have sufficient producing capacity if running continuously, to supply at least 25,000,000 people with lumber and we have approximately 2,000,000 who can be reached with our product.

The Hastings Shingle Manufacturing Company, Victoria, B.C.: We expect a good volume of trade during 1912, but prices will be low owing to conditions in the United States.

"The volume of trade was greater and so were profits. Prices were about the same. Stocks are lighter than a year ago. Lath were in good demand and shingles were weaker."

The Cameron Lumber Company, Victoria, B.C.: The local demand has for some time taken our whole output and the prospects are that the same condition will prevail throughout 1912.

"The volume of trade was about the same, though if anything greater, than in 1910. Profits were 5 per cent. less. Shingles sold at an advance of 10 per cent. and lumber was 10 per cent. lower. Stocks to-day are approximately the same as a year ago."

The Sparwood Lumber Company, Sparwood, B.C.: We are hopeful for better trade in 1912. If the United States mills could be prevented from dumping cheap common boards and dimensions on the prairie markets, the market for Mountain manufacturers would be good. About fifty United States mills in Montana, Idaho and Washington failed last year through dumping at prices less than cost.

The Abbotsford Timber and Trading Company, Abbotsford, B.C.: The outlook is for a little better trade in 1912 we think than was the trade in 1911. The United States mills dumped great quantities of lumber into Canadian markets during 1911 at slaughter prices. We know of instances where No. 1 sized dimension 2 x 4, 2 x 6, 2 x 8, etc., was sold by Puget Sound mills for \$5 per M. f.o.b. cars; V. ceiling, flooring, etc., kiln dried at \$8.50 to \$12 f.o.b. cars. It has been a case of any old price often, to turn stock into money. We cannot do much when competition of this kind is allowed by the Government.

### Timber Branch Statistics

The statistics of the timber branch of the British Columbia Department of Lands for the year 1911 show the revenue of the branch to have been well maintained, approximating a little over two million dollars, as it did so during the years 1910 and 1909. During the past twelve months a number of licenses lapsed, and the lands which were covered by them have thus become available for settlement and colonization. Increases are noted in the receipts through the transfer of timber and coal prospecting licenses, and under the head of penalties, transfers of such character having produced during 1911 \$13,199 and penalties \$18,625. The total timber branch revenue of the province for 1911 amounted to \$2,297,452.25.

The total revenue from the timber lands of the British Columbia Department of Lands for the month of December, 1911, was considerably over \$225,000, there having been issued during the period 595 timber licenses for lands west of the Cascade range, producing receipts of \$92,140; 869 licenses for timber lands on the eastern slope of the divisional range, returning in fees \$104,453.80; timber transfer fees netted \$555; penalties, \$1725; 247 coal prospecting licenses, \$26,400; and coal prospecting license transfer fees, \$315,000; an aggregate total, not inclusive of miscellaneous receipts, not yet estimated, of \$225,588.80.

### British Columbia's New Timber Regulations

A bill to give effect to the recommendations of the forestry commission of British Columbia has been presented to the B. C. Legislature, by the Minister of Lands, Hon. W. R. Ross. The bill follows very closely the recommendations of the commission with the exception that it proposes to continue the issuing of hand loggers' licenses. A forest branch of the Department of Lands is to be created under the direction of a chief forester. Provision is also made for the appointment of a provincial forest board. Sales of licenses to cut timber are to be made by public competition, the tenderer offering the largest bonus to get the license. Existing leases are to be renewable for consecutive and successive periods of 21 years. Leases at present existing are to be subject to a rental of fifty cents an acre and a royalty of \$1.50 per thousand feet. Any holder of a lease may, by its surrender before April 1, 1913, exchange it for a license under the new regulations. All special licenses which were applied for before April 15, 1905, are to be transferable and renewable yearly for a period of sixteen successive years from the original date of issue and all issued between that date and March 10, 1910, yearly for 21 successive years from the date of issue. Every holder of a special license who complies with the amendments made in 1910, before April 1, 1912, may have the license made transferable and renewable from year to year while there is merchantable timber upon the land in sufficient quantity to make it commercially valuable. The fee for this, covering not more than 640 acres, is \$140 for licenses west of the Cascades and \$115 east of the Cascades. Very stringent provisions are made for the prevention of forest fires.

### Lumber Company's Managers Hold Conference

The first annual conference between the management of the Canadian Western Lumber Company, New Westminster, B.C., and its subsidiary companies and the managers of their retail lumber yards in Manitoba, Saskatchewan and Alberta was held at Vancouver recently. Mr. A. D. McRae, vice-president and general manager of the parent company, presided. No less than twenty-three representatives from the prairies were in attendance. They brought in favorable balance sheets and reported the outlook excellent for the coming spring and summer season. Many of the visitors emphasized the fact that the crop loss last year was exaggerated and that the financial returns to the farmers are proving very substantial. Plans of campaign for the year, as well as methods for meeting the competition of American lumbermen were outlined and adopted.

# Progress of Forestry in Canada—1911

## Gradual Adoption of Practical Methods—Governments and Lumbermen Commencing to Realize Importance of Scientific Management of Forest Lands

By H. R. MacMillan

**F**ORESTRY in Canada is passing from the realism of discussion into practice. At present forestry in Canada comprises the protection of forests from fire, the examination of crown lands in advance of settlement to prevent the locating of settlers on non-agricultural forest lands, and the experimental regulation of timber sales so as to leave the land in the best possible shape for the production of a future crop of valuable timber. I say the experimental regulation, because no definite system has been arrived at yet, and not one-thousandth of one per cent. of the logging of Canada is planned with a wise regard for a future crop of timber.

A review of the progress of forestry in 1911 shows that this science, ten years old in Canada, is yearly gathering a greater momentum. The timber lands of Canada are administered by six different governments, Nova Scotia, New Brunswick, Quebec, Ontario, the Dominion Government and British Columbia. The advances made during the last year in each jurisdiction will be briefly noted here.

### Nova Scotia's Critical Condition

Of all the provinces administering timber lands Nova Scotia has the least stake in its forests. The law in Nova Scotia permitted the sale outright of the crown timber lands, and as a result there is but very little of the public timber remaining which has contributed so handsomely to the revenues of the other provinces.

This province, seemingly the least able to afford it, has been the first to undertake an accurate survey of its forest resources. The compilation of this work has just been completed in 1911, and Dr. Fernow, of Toronto University Forest School, under whose direction the work was done, has submitted to the provincial government a very complete report, stating the approximate quantities of timber left in the province, the rate at which this timber is being used, and the general rate at which it is reproducing. The report further points out the proportion of land under forest, the area suitable for agriculture and the area burned over and barren. It is urged that on account of the wealth which forest products bring into the province, an effort should be made immediately to provide for the better forest management of the large proportion of forest land in the province and thus extend the life of the lumber industry, which, at the present rate of cutting, will be short. Undoubtedly a provincial forester, who could act in an educational capacity as the provincial foresters of New Hampshire, Vermont, Massachusetts, Connecticut and other states, would be of great influence in encouraging a wiser method of conducting logging operations than now prevails in Nova Scotia. As it is, it appears that Nova Scotia will be the first of the mainland provinces of Canada to suffer severely from the diminution of the lumber industry, and, as a very large proportion of the province is non-agricultural and non-mineral bearing, no other productive industry can come after lumbering.

### Co-operation In New Brunswick

The New Brunswick government pledged its support to forestry when it appropriated money for the School of Forestry in connection with the Provincial University at Fredericton. The province has not yet undertaken any forestry work of any kind, and has done nothing to provide work for the men it is educating. Students of the provincial forest school in New Brunswick are largely dependent upon the Dominion Government for work. Interest has been shown by the lumbermen and other private land owners. The lumbermen have thrown their camps open for the education of the foresters. An arrangement has been made whereby the Forest School will undertake the management of a forest tract of about 3,300 acres. This tract will be used as a demonstration area.

On October 1st, the Provincial Government put into effect a law which has been passed forbidding the further export of unmanufactured pulpwood from the Crown lands of New Brunswick. This may be termed a forest conservation measure as it will discourage the rapid exploitation of New Brunswick's forests, and will, by establishing mills in New Brunswick near the source of the raw material, encourage a closer utilization of the wood, as it is well known that the mills located at a great distance from the timber only use the cream of the logs.

No changes have been made in the methods of fire protection in New Brunswick, except that arrangements have been made for the patrol of the timber areas tributary to the National Transcon-

tinental and other new railroads. The fire guardians are all temporary employees, and, as such, are not as efficient as if forest reserves were created and a permanent organization developed.

### Quebec's Progressive Policy

The Province of Quebec is ahead of any of the other provinces in planning a scheme by which foresters will be trained by the province, especially for work on provincial lands, and will be employed by the provinces both during their period of training and after.

The school which has been established in connection with the University of Laval, has been increased, scholarships have been established by the government to encourage the attendance of men who will make good chief forest rangers and inspectors of operations in Crown lands.

In connection with the school a nursery is maintained at Berthierville where forest seedlings are raised to be used for replanting denuded areas in the agricultural portion of the province. Examinations have been made of certain tracts of sandy land and arrangements are being made to have the lands reforested with government assistance.

More attention is being paid in Quebec to the examination of public lands before they are opened for settlement than has been customary in the Eastern provinces. The forest engineers and students of the forest school employed by the Department of Lands and Forests, have made careful investigations of land before it was opened for settlement, and whenever in their judgment the land has been non-agricultural in character, and when the intention of the settlers has been to denude the land of timber and abandon it, entry has been refused. Such examinations were conducted in the counties of Montmagny and elsewhere last summer.

Examinations are also being made by the officers of the Forestry Branch of the settlers' locations in timber districts, where the settlers have been accused of stripping timber from timber limits.

The machinery is being slowly provided to administer the vast areas of forest reserves set aside several years ago. It will be remembered that nearly the whole of the Province of Quebec north of the Ottawa and St. Lawrence rivers was created a forest reserve, together with the Gaspé Peninsula. This area is divided into inspection districts under the charge of Provincial Foresters Piche and Bedard. A laudable attempt has been made to inspect regularly the operations on timber licenses within these reserves, to see that no timber is wasted and that the fixed diameter limits are followed for different species. A close and satisfactory inspection is impossible for the staff employed, but the men turned out by the Provincial forest school are doing good work, and the occasional inspection by the forest officers will eventually lead to wiser and less wasteful logging.

The government has adopted the policy of consulting the provincial foresters regarding the terms upon which timber will be put up for sale.

Explorations are also being made of the northern timber country. An examination was made in 1911 of the timber in the Abitibi region and of the forest conditions along the route of National Transcontinental railroad.

There is such a large area of inaccessible timber land in Quebec that it is almost impossible to provide for its fire protection. Although a larger area has been set aside in this province than in any other as permanent forest reserves, no permanent fire protective organization has been developed. The fire protection has depended largely upon new men hired temporarily each summer. In addition to this disadvantage, appropriations for fire protection have been hopelessly inadequate. The government made things easier for Mr. W. C. J. Hall, the Superintendent of Fire Protection in 1911, by voting a larger appropriation for preventing forest fires than heretofore.

The continuance in the face of strong opposition of the embargo on the export of pulpwood from crown lands in Quebec was a move in the interests of forestry.

### Improvident Methods of Ontario

There is not much progress to record in the scientific administration of forests in Ontario in 1911. Although Ontario is the wealthiest and in many ways the most progressive province in

(Continued on page 70)

# WANTED & FOR SALE DEPARTMENT

## PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

## WANTED—LUMBER, ETC.

WANTED—Kindly give best cash price for three or four cars dry cedar posts, 4 to 6 inches top end. Box 195, Jordan, Ont.

WANTED—5 x 5 White Maple, second growth, dry, 5 to 10 years old, for bowling pins. Address, M. J. Bernhard, 712 to 720 Jefferson Street, Buffalo, N. Y. 1-4

Two-inch Soft Elm wanted, immediately, several cars, dry. State quality and prices. Great Lakes Lumber Company, Limited, Owen Sound, Ont. 1-4

## Saw Logs Wanted

Red and White Pine, Hemlock and Spruce. Write in particulars of what you have. Reid Bros., Bothwell, Ont. 2-7

## Basswood Wanted

WANTED—inch No. 2 common and mill culls, winter cut Basswood. Apply Firstbrook Box Company, Limited, King street east, Toronto. 22-25

## Box Factory Lumber

When you have any box lumber to offer write us, giving quantity, description and price, water delivery. Chicago Bill & Lumber Company, Chicago. 3

## White Pine Wanted

3 in. x 6-in-7-in. 18 ft. Tank Stock, also Quarter Cut White Pine Pump Squares. Ontario Wind Engine & Pump Co., Ltd. Toronto, Ont. 22-25

## Lumber Wanted

Large quantities of Soft Elm Lumber, 1-in. and grades No. 1 common and better. Especially attractive prices. J. S. FINDLAY, Owen Sound, Ont. 2-7

## Pulpwood

Wanted—to contract for 15,000 cords, or appreciable parts thereof, yearly for a term of years, of rossed spruce pulpwood for American shipment. Address Box 416, Canada Lumberman, Toronto, Ont. 3-4

## Lumber Wanted

Will contract with saw hardwood mills for their entire cuts, 1912, including culls. Highest prices paid, and quick shipment. Also open for dry stock of all kinds. Also Spruce and Hemlock. Apply to Box 414, Canada Lumberman, Toronto. 2-5

## Spruce Wanted

We can use short Spruce 4 1/4-in. and 5 1/4 in., in 2 1/2-ft. and 6 1/2 ft. Describe what you have to offer, and give lowest price delivered here.

THE RATHBUN COMPANY, Deseronto, Ont. 3-8

Wanted to buy 1-in. and 2-in. Spruce, Jack Pine and Cedar Posts. Apply Box 421 Canada Lumberman, Toronto, Ont. 3

## Hardwood Wanted

3,000,000 feet Hard Maple, Soft Elm, Rock Elm, Beech, Birch, Basswood, Ash, Oak, and Soft Maple, for delivery, shipping dry during 1912. Sawed to our sizes. State what you have to offer and lowest prices for spot cash. Inspection at mill. Apply Manufacturer, Box 401, Canada Lumberman, Toronto, Ont. 1-8

## FOR SALE—LUMBER, ETC.

### For Sale

Two carloads White Oak Timber in round six to ten inches diameter small end. Eighteen to thirty feet long. ROBERT LIGHT, Napanee, Ont. 3-5

### Hardwood For Sale

We are prepared to cut under contract:— 250 M. to 500 M. feet Hard Maple. 100 M. to 200 M. feet Basswood. Also some Black Ash, Birch, Soft Elm. Correspondence invited. The Pearce Company, Limited, Marmora, Ont. 22—tf

### For Sale

The following Special Stock;— 1,000,000 ft. Scant 2-in. Spruce Random. 300,000 ft. 1-in. Spruce Mill Culls. 50,000 ft. 6/4 and 8/4 White Pine Mill Culls. 100,000 ft. 1-in. 6 to 9 ft. White Pine Shorts. 100,000 ft. 1-in. Fourth Quality or Box White Pine. All dry and can be shipped promptly by rail. THE A. SHERMAN LUMBER CO., Potsdam, N. Y. also 50 Church St., New York City. 22—tf

### For Sale at Greatly Reduced Prices

400,000 M ft. 1 x 4 and up by 6/16 ft. No. 2 Hemlock. 75,000 M ft. 1 x 8 and 10 x 6/16 No. 2 Hemlock. 25,000 M ft. 2 x 4 x 6/16 No. 2 Hemlock. 25,000 M ft. 2 x 6 x 6/16 No. 2 Hemlock. 35,000 M ft. 2 x 8 x 6/16 No. 2 Hemlock. 25,000 M ft. 2 x 10 x 6/16 No. 2 Hemlock. Must have room and will sell away below cost.

THE RATHBUN COMPANY, Deseronto, Ont. 2-4

### White Pine Logs For Sale

On Magantawan River, about thirty miles from Georgian Bay, in Township of McKenzie, Parry Sound District, approximately 7 1/2 million feet. Early delivery to mill for sawing.

Will sell in one or two lots. Stock of superior quality. Eighty per cent. sixteen feet length. Ninety-five per cent. White Pine, balance mostly Red Pine. Located for convenient inspection near Deer Lake Station on C. N. O. Railway, 23 miles north of town of Parry Sound. Further particulars upon request.

HOLT TIMBER COMPANY, 926 Manhattan Building, Chicago, Ill. Ontario office, Whitestone, P.O.

### For Sale

1-in., 1 1/4-in., 1 1/2-in. and 2-in. mill cull White Pine in strips and sidings. Fred T. Smith, Board of Trade Building, Montreal. 1-tf.

### For Sale

About 15,000 feet 2-inch beech, 12,000 feet of 1-inch, 1,500 feet of 1 1/4-in., 5,000 feet 1-in. maple; 600 feet 1-in. hickory, 2,000 ft. 1-in. oak, all log run. John Richie, Allan's Mills, Ont. 2-3

### Shingles

500,000 M. pieces Rathbun's XX-18-in. Cedar Shingles. To introduce this shingle to the trade, we are offering them for one-half their value. \$1.00 per M. pieces F.O.B. cars Deseronto. The Rathbun Company, Deseronto, Ont. 1-4

### 12 in. x 12 in. For Sale

300,000 feet B.M. of 12-in. x 12-in. short leaf yellow pine timbers 18 ft. to 40 ft., average 30 feet. Can ship immediately.

JAMES SHEPPARD & SON, Sorel, Que. 24-3

## FOR SALE—MACHINERY, ETC.

### For Sale

Good boiler, 72 inches by 14 feet, 72 4-in. tubes, 75 h.p. engine and 100 light dynamo. All in good condition and ready for immediate delivery. Will accept lumber in exchange. Apply to Box 400, Canada Lumberman, Toronto, Ont. 1-4

### Rails For Sale

Thirteen miles 56 and 60 pounds per yard and fishplates. Ten miles 80 pound per yard and angle bars. Also 16, 20, 30, 40, 50's. New rail, all sections in stock. For particulars apply to J. J. Gartshore. 1-4

### Machinery For Sale

A Waterous No. 4 Band Saw Mill, with Carriage Saws, Live Rolls, and complete Filing Room equipment, also several Good Woodworking Machines, in splendid condition.

J. S. FINDLAY, Owen Sound, Ont. 2-TF

### For Sale

One Gang Circular Sawing Machine (Kendall patent) good as new; run only 18 months. This machine carries nine 32-inch saws, takes from 4 to 10-inch cants, can be set to cut one to three inch stock. Reason for selling, cut out. For price, write Jas R. Gillies, Arnprior, Ont. 24-5 Toronto, Ont. 3-4

### Saw Mill Property For Sale

Saw Mill Property at Ford River, Michigan, consisting of three band saw mill, shingle mill, tie and post mill, lath mill, docks, and trams, blacksmith shop and machine shop, all stocked with tools, large store and office building, large boarding house, large barns, sixty-three houses, lands, etc., all of which will be sold at a bargain. Apply to The I. Stephenson Company, Wells, Delta Company, Mich. 3-6

### Machinery For Sale

Carver, 4 spindle, Rohlman. Cut-off saw, railway, wood frame. Dovetailer, Boults. Engines and boilers, various sizes. Floorer, 9-in. Berlin. Jointer, chair seat, Jenkins. Jointer, 16-in. White. Moulder, 6-in. Houston. Mortiser, Smith. Mortiser, Bit. Planers, 24-in. single belted. Sander, double 24-in. Perry. Sander, three drum 42-in. Boardman. Sander, three drum 42-in. Columbia. Saw Gummer, Rogers. Saw-mill, band, 63-in. wheel. Saw and dado machine, Williamsport. Variety Lathe, Pringle & Brodie. O. L. PACKARD MACHINERY CO., Milwaukee, Wis.

## WANTED—MACHINERY, ETC.

WANTED—By small mill cutting hardwood, power feed edger, iron or wood frame, with 2 or 3 adjustable saws, to cut stock up to 3 inches thick. Must be cheap. Craik Bros., Crampton, Ont. 2-4

### Alligator Wanted

Wanted an alligator boat, in good condition. Reply, giving condition, size, age, equipment, price and situation. Box 405, Canada Lumberman, Toronto, Ont. 2-5

WANTED—Two boilers, not less than 100 pounds steam, 66-in. x 14 ft. Filing room outfit for 12-in. double cutting band saws. One good log jack and chain. Give full particulars in first letter. Box 412, Canada Lumberman, Toronto, Ont.

## WANTED—EMPLOYMENT

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

Wanted a position as gang-filer; eighteen years experience. Address Geo. L. Nichols, c/o Canada Lumberman, Toronto, Ont. 2-4

First-class band and band resaw filer experienced in box factory and saw mills. References. Box 383, Canada Lumberman, Toronto, Ont. 24-3

Band Saw Filer wants position for coming season. Single or double cut. Twenty years experience. Address Box 413 Canada Lumberman, Toronto, Ont. 2-4

Architect and Surveyor, A.R.I., B.A. (25), requires post in spring. Thoroughly efficient. 22 Southborne Grove, Bournemouth, England. 3-4

WANTED—By experienced man, position as manager of Saw Mill or General Store Business. A1 reference. Reply Box 425, Canada Lumberman, Toronto, Ont.

WANTED—Position as double cut Band Saw Filer, 15 years experience. Can give good references. Reply Box , Canada Lumberman, Toronto, Ont. 3-5

As Band Saw Filer, double or single cuts, or in a factory where there are band resaws. First-class references. Reply Box 422, Canada Lumberman, Toronto, Ont. 3-5

Wanted by lumber inspector, position by the year. Fifteen years experience. Ten years with present firm; reference furnished. Car or boat shipping. Box 409 Canada Lumberman, Toronto, Ont. 2-3

Saw Filer wants position in saw mill or woodworking plant. Capable of keeping band and circular saw in perfect condition. Apply Box 403, Canada Lumberman, Toronto, Ont. 2-4

As Woodworking Machine Hand, by a young married man, strictly temperance. Ten years in a planing mill operating Planer, Matcher and Moulder. Open for engagement after March 1st. Moulder work preferred. State wages. Box 429 Canada Lumberman, Toronto, Ont.

WANTED—Position of trust with Lumber Company. Have been in present position 18 years, and own an interest in the business. Have had full charge here, and can get results. Thoroughly understand the business from stump to market, including mill and office; reputation the very best; would consider partnership with man of means to manufacture or take position as Manager or Assistant Manager, or as salesman or buyer on the road. Am well and favorably known by the trade. Owing to disagreement of partners is why I wish a change. Box 424, Canada Lumberman, Toronto, Ont.

**WANTED**—Position as bookkeeper with lumber firm in Ontario. Twelve years' experience, mostly as office manager; age 34 years. Acquainted thoroughly with all departments of lumber office. Best of references furnished on application. Apply Box 399, Canada Lumberman, Toronto, Ont. 1-8

## WANTED—EMPLOYEES

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

**WANTED**—Smart young man as stenographer and office assistant. Experienced preferred. Apply to the C. Beck Mfg. Co., Ltd., Penetanguishene, Ont.

**WANTED**—Hardwood lumber buyer; must be experienced and capable of grading in accordance with National Hardwood Rules. We want a high-class man and will pay accordingly. Box 380, Canada Lumberman, Toronto, Ont. 24-3

**WANTED**—By Ottawa firm, a good salesman, mostly white pine, to hustle for trade west of Ottawa. Commission or salary; former preferred, name terms and references. Box 419, Canada Lumberman, Toronto, Ont. 3

Millmen wanted, millwrights, edgermen, trimmermen, engineer, band saw filer. Lath mill men and lumber pilers. Mill will start as soon as ice clears in spring. Apply giving experience, etc., To Dymont Mickle Lumber Company, Whitney, Ont. 2-3

Wanted, a thoroughly competent Band Saw Mill man, to supervise the installation of new and old machinery in new mill and to continue on as superintendent of plant; permanent position for right man. Write direct. J. & W. Duncan, Limited, 1833 Ontario Street East, Montreal. 3-4

## BUSINESS OPPORTUNITIES

### Timber Limit For Sale

1,200 acres Hardwood, Hemlock and Cedar. Some Pine; 9 million feet for \$5,000 cash. Five miles from railroad; two from river. Box 431, Canada Lumberman. 3-4

### Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

### For Sale

Up-to-date Circular Saw Mill, going concern, 15,000 to 20,000 capacity; In good shape. House and stables, tools and utensils of all kinds, 300 acres of bush land, railroad connection. Much timber can be bought. This is worth looking into. Will be sold cheap. Write Jones Brothers, Katrine Station, Ont. 1-2

### For Sale

Established Lumber Business, with first-class mill, now running full time. Timber limits with 20 to 30 million feet of standing pine timber conveniently located, and all merchandise, etc. Price \$55,000. This is worthy of investigation. Address Box 332, Canada Lumberman, Toronto, Ont. 19-22-t.f.

### Planing Mill and Sash and Door Factory For Sale

Modern in every way, machinery, building, heating, dry-kilns, etc. Would consider proposition to run same from practical man who could take full charge and would invest some money as evidence of good faith and ability. Factory could be converted for use of other industry if wanted.

For complete description of plant apply Box 430, Canada Lumberman, Toronto, Ont. 3-TF

### For Sale

Mill and Plant situated on Bay Lake of Montreal River and within the town limit Town of Latchford on T. & N. O. Ry. Plant consists of one Boiler, 60 in. diam. by 14 ft. long, full flush front and rated at 70 h.p.

Right Hand Engine, 12 in. x 16 in., estimated 64 h.p.

Three Moreau Machine Pulpwood Barkers and Pullup and all saws, shafting, belts, etc., including extras.

Siding of T. & N. O. Railway runs into mill yard; good storing point for logs. With very little extra cost, a circular saw and carriage could be installed as the power is sufficient. This plant has been in use about 10 months only and is in good condition. An excellent bargain for the right parties. Write or communicate with C. & H. D. Gamble, 28 Scott street, Toronto, Solicitors for Owners. 2-7

### Sales Agents Wanted

Large British firm with plants in England, Bohemia and France manufacturing Carborundum and Electrite goods and high class grinding machinery wants to secure either first class salesmen or firms with established trade connections to represent them in Canada. Apply Box 394, Canada Lumberman, Toronto, Ont. 1-2

### For Sale

170 ft. 1 in. good basswood short, 2 to 5 ft. 11 M. ft. 1 1/4 in. good basswood short, 2 to 5 feet.

14 M. ft. 2 in. good basswood short, 2 to 5 feet.

50 M. ft. 1 in. M. C. Ash.

50 M. ft. 2 in. M. C. Ash.

GEO. C. GOODFELLOW.

Montreal, Que.

### For Sale

Sawmill and Shingle Mill in active operation and thoroughly equipped with A1 up-to-date machinery in first class condition. Timber on all sides. Exceptional opportunity; \$1,600 cash, \$1,600 in 6, 12, 15 and 18 months. Can secure eighty acre cut of virgin timber, thirty yards from mill if desired. Write D. McNair & Son, Whitewood Grove P. O., Ont. 23-2

## Canadian Timber Limits

E. STEWART (Forest Engineer)

Dealer in Timber Limits, Ontario and Western farm lands and town property. Excellent investments now open. Correspondence invited. 84 King Street East, Toronto. Phone Main 5609.

### Planing Mill, Saw Mill and Heading Mill For Sale

This is one of the best equipped Planing Mills west of Toronto, doing a prosperous business. Heading and Saw Mill in good condition; considerable timber to be had; will sell all or will sell Planing Mill separate. This is a going concern; no better proposition anywhere; a money maker. Will stand the strictest inspection. Can give satisfactory reason for selling. Reply to Box 417, Canada Lumberman, Toronto, Ont.

### Valuable Timber Property For Sale

The Oromocto Lumber Co., Ltd., ask for tenders for their property. (Tenders to close on or before 3rd day of April, 1912), and to be mailed to Mark Curry, Amherst, N.S., marked "Tenders for Property of the Oromocto Lumber Co., Ltd."

This property consists of about 74 square miles of New Brunswick Government land and about 5,783 acres of granted land, and about 30 acres of leasehold land, situated on the branches of the Oromocto River and estimated to contain sixty to seventy millions of logs, spruce, fir, pine and hardwood, and one hundred millions of pulp wood; property contains mill, five houses, barns, camp outfits, seven horses, rigging, etc.

The lumber cut off this property is available for shipment to either the United States or the English market as mill is on the line of the C. P. Railway, rate of freight to Boston points 14c.; St. John 3c.

This property is well situated to be operated cheap, and logs or sawn lumber produced at a low figure and is without doubt one of the best properties of its size in Eastern Canada.

Full particulars with regard to the property, etc., may be obtained from Mark Curry, Amherst, N.S.; Frank H. Lowe, Brooklyn, Queen's County, N.S.; William E. Golding, St. John, N.B., or the Oromocto Lumber Company, Ltd., Central Blissville, N. B. 3-6

## HUTHER BROS. PATENT GROOVER OR DADO HEAD

For cutting any width groove from one quarter inch to 2 inches or over

Can be used on any Circular Saw Material. Will cut a perfect groove with or across the grain. This is the only Dado Head on the market that gives entire satisfaction on all classes of work. No screw adjustment. For different width grooves, simply remove or add inside cutters. Sold by builders and dealers of wood working machinery in all parts of the United States. Will send on approval, in competition with any other make on the market; if not the best return at our expense. HUTHER BROS. SAW MFG. CO., Inc., 1170 University Ave., ROCHESTER, N.Y., manufacturers of Circular Saws, Morgan Pattern Lock-Corner Box Cutters, Concave Saws, etc.

# Review of Current Trade Conditions

## Ontario

Mill culls and dead culls in white pine have strengthened considerably in Ontario, of late. Some stocks that had been dragging along rather slowly are now practically off the market. Red pine shows a decidedly firmer tone all through, even as compared with the prices of a month ago. White pine in the upper grades is firmly held by manufacturers who are looking for higher prices for the good end. Wholesalers however, report that this portion of the cut is now so high in price that it is difficult for the consumer to use it to advantage and make any profit. Lath are stronger. There is a good demand for hemlock and an advance in price would not be a surprise before the spring trade sets in.

## Eastern Canada

The prevalence of cold weather at Montreal has interfered to some extent with the retail lumber trade, which has been rather slow. Good reports however are received from the wholesale firms who state that inquiries are arriving in good volume and that a moderate trade is being done. Compared with a year ago, trade is appreciably better and there is a noticeable tendency towards better prices. An advance of from 50c. to \$1.00 per thousand feet for mill and box culls is reported for forward trade. Hardwoods continue firm and in active demand. Indications are that the spring business will be favorable. The sash and door manufacturers have a fair quantity of orders. The stock taking season is now past and inquiries from the retail yards indicate that the year's operations as a whole were satisfactory.

There has been a small but steady demand for spruce at Boston recently from retail workmen. The asking price for frames has been \$25 although some sales have been reported at \$24.50. There is only a moderate demand for random. Offerings are light and prices steady. Boards are quiet at steady prices. Eastern spruce at New York is being disposed of rather easily. Buyers are presenting fair sized inquiries and carload shipments are slow in arrival. Prices are firm in all sizes and local stocks are low. Improvement is expected in the building situation during the early spring. It is therefore believed that there is good prospect for a strong demand and higher prices. The demand for hemlock at New York is quiet. Local stocks are only moderate; prices are about steady. At Boston, the offerings of dry eastern clipped boards are small, although orders have been booked at slight concessions. Although held at \$20 in most cases, some have been sold at \$19.75. The shingle market at Boston is very firm and the demand is fair. Cedar shingles are firm at from \$3.60 to \$3.65 for extras and a few choice ones have been sold at \$3.75. There is a good demand for clears at \$3.25 to \$3.35. Lath are slightly easier. The price asked for 1 5/8-inch however, remains at \$4.00 to \$4.15 and for 1 1/2 inch \$3.50.

## Great Britain

There is apparently no inclination on the part of the steamship companies to reduce their freight rates between Great Britain and Canada. Shippers of spruce deals accordingly are not inclined to agree to any reduction in prices for forward delivery, which of course would involve lower f.o.b. prices. Spot values are reported to be in harmony with c.i.f. prices and the stocks at Mersey ports are lower than they were a year ago. Liners are not expected to bring any excessive shipments and it is expected therefore that a large reduction in stocks will occur before the new stocks begin to arrive.

At London, the trade at the beginning of the year was quiet and importers are rather more cheerful about the prospects for the year's trade. They are not however in a mood to make forward contracts at the prices now asked by agents. The impression seems to be that nothing will be lost by waiting until shippers are more disposed to come down to a lower level of prices. Deliveries at London docks have been considerably lighter and the total for last year was much smaller than for the year previous, on account largely of the high freight rates which were in effect during the last half of the year. Present indications are that the coming season will yield more profit to the ship-owner than to others who are concerned in the handling of wood goods. Freights are expected to be quite 5s. per standard higher than they have been of late years.

At Liverpool, the lumber trade in general is disposed to expect an improvement in business as soon as cotton and other labor difficulties have been disposed of. Stocks at Liverpool at the end of the year showed a decline in most cases. Quebec pine, hewn pitch pine, Canadian and United States oak, and spruce were among the stocks of which the supply had decreased. Nearly 30 per cent. less of square waney board pine logs were in stock than a year ago. Taking these together with the stock of Quebec pine deals, boards,

sidings and other pine products, there was a shortage of about 2,000 standards, the decrease being most noticeable in the high class goods of white pine, such as sidings and boards. Arrivals, as is usual at this time of year, have been small.

The timber trade at Manchester was slow in reviving after the holiday season. The cotton trade trouble was largely responsible. With the reported conclusion of this unfortunate disturbance, it is expected that trade will immediately improve. The timber trade of Manchester showed a heavy shrinkage in stocks at the end of 1911, as compared with a year previous. The shrinkage was most noticeable in pitch pine and birch planks, the stock of the former in hewn, sawn and planks being more than 50 per cent. lower than the stock of a year ago. It is naturally to be expected therefore that higher prices will be asked. This, together with the increased freight rates, will probably prevent any extensive additions to stock for some time. There is a good demand for birch planks, stocks of which are about 70 per cent. less than a year ago. Good quality birch planks are very scarce. Spruce deals are unchanged with prices stiff. Any improvement in the demand would probably advance the prices. The movement of floorings is slow. The joiners' and contractors' trades are very quiet.

The Glasgow timber trade was rather slow in picking up after the dullness of the Christmas and New Years holidays. Reports issued by the various Glasgow timber firms show that the available stocks at the end of the year were nearly 1,500,000 cubic feet less than they were a year previous. The indications for the future are that prices will advance. Every year of late there has been an advance in the prices on Canadian pine and elm and there is an apparent effort under way to include birch in the same category. When one takes into consideration the numerous claims made by buyers on shipments of birch plank it must be admitted that they are sold too cheap. Indications also point to an increase in the price of pitch pine. The current retail prices will not permit of importations at a profit.

## United States

The extreme cold weather which occurred during the first few weeks of the new year, limited the production of lumber considerably in the United States, but a warmer period soon arrived and yards commenced to move their stocks rapidly. At present one of the most noticeable features of the trade is an improved inquiry regarding prices. The sales at Chicago for the week ending January 13th amounted to 19,785,000 ft. against 29,566,000 ft. during the corresponding week of 1911. The total receipts from January 1 to 13th amounted to 48,527,000 feet, an increase of 7,561,000 feet over the corresponding period of 1911.

Chicago.—There is a fair demand for this time of the year for northern pine. The wood-working plants are enjoying a steady business and the box situation has improved considerably during the last few months, so that orders are fairly plentiful and prices are better. There is a fair demand for sash and doors and all kinds of building material. In fact there is a firm market for all good grades of pine and a slightly advancing tendency is noticeable. The low grades are also steady. The country trade is quiet. A slight increase is reported in the demand for hardwoods but the trade for the new year has not yet reached its full proportion. The consuming interests show signs of laying in their supplies and the yards and other distributing centres are giving indications of a very active demand. The general tone of the hardwood market is firm with no inclination on the part of holders to make any concession. High grade plain red oak is scarce with the result that the lower grades are more active. There is a very fair demand for birch, maple and basswood. The railroad companies are making numerous inquiries and the outlook for 1912 is quite promising.

Buffalo.—Sales of northern pine have shown a slight decrease during the severe weather. The demand for high grades is about normal and the low grades are very firm. It is expected that these conditions will continue. It is reported by one dealer that 75 per cent. of all the low grades of white pine lumber has been sold for the year and that a stiff advance is looked for. The low grades of eastern Canadian spruce are well cleaned up and higher prices are expected. The hardwood trade is in fair volume for this time of the year. Quartered oak is firmer and other woods are steady. The trade in hemlock is light but the prices are firm with an inclination towards improvement in the near future. North Carolina pine is held firmly, especially in the lower grades. Southern yellow pine is also strong but rather quiet. Shingles are quiet as the market is well supplied. Prices are unchanged without any inclination toward improvement. Stocks are only moderate.

## Progress of Forestry in Canada

(Continued from page 65)

Canada, the government has never adopted any advanced ideas of forest management. This is true in spite of the fact that Ontario is reaping an enormous revenue by following the improvident method of cutting constantly into the forest capital without taking any means of providing for any future reforestation except such as may be accidental, or may be secured by rule of thumb methods.

The Ontario Government has, however, done Canada a service by establishing and maintaining the best forest school in the country. The students of this school are the mainstay of the Forestry Branch of the Dominion Government. The school is constantly being strengthened and is gradually attracting a larger and better class of students.

The Toronto University Forest School is keeping in close touch with forest work throughout the country. This alertness on the part of the staff, together with the added information concerning Canada's forest areas which is being made available by the work of the graduate foresters, cannot fail to make the students more useful to their employers.

It is interesting to note that though the Toronto University Forest School has been maintained by the government for about five years, no students have yet been employed by the Department of Lands and Forests except as fire rangers.

The province is annually spending larger sums on fire protection. The same system has been followed for many years. The only permanent improvements made are ranger cabins, open trails and portages. In fact the territory is so large that it is almost impossible to adopt any of the newer devices for fire protection which have found great favor in the States,—extended trails, lookout towers and telephones. It is probable that for very little extra cost the utilization of the labor of the fire rangers would enable a start to be made at introducing these improvements on the permanent forest reserves where they would be of assistance in a more prompt discovery of fires. Ontario labors under the disadvantage, common to all of Canada, of having such a small population in timber lands that it is hard or impossible to get sufficient fire fighters.

The policy lately announced by the Minister of Crown lands that no students would be employed as fire rangers is probably a good one. A fire ranger should know his district, be an experienced woodsman, be able to handle men, be resourceful and conscientious in his duties. Students are likely to fail in all of these points except the last unless they be the more mature forest school students, who are scarce and can usually secure better positions. The next step to be made in appointing fire rangers in Ontario is to develop a permanent nucleus who will be fire rangers in summer, act as scalers and rangers on lumbering jobs in the winter, and will be constantly improving the means of fire protection and communication in their districts. This plan has been worked to advantage in the 190,000,000 acres of forest reserves in the United States.

A small addition was made to the Algonquin Park Forest Reserve in 1911. The Forest Reserves of Ontario are not forest reserves in the proper sense of the word, that is areas of land set aside to be managed according to the best advice for the greatest possible production of timber. The forest reserves of Ontario are given better fire protection than unreserved Crown lands, but the timber in the forest reserves is not being used to the best advantage.

The production of nursery stock for planting in denuded farm lands is being continued. The areas purchased by the province for reforestation are being covered as quickly as the capacity of the nurseries and the size of the appropriations will permit. Planting is now being taken up by municipalities. The city of Guelph has the first city plantation in Canada.

A law has been passed by the legislature authorizing townships and counties to borrow money to reforest waste lands within their borders. This will be an important advance. It will be of more interest to lumbermen than is usually recognized. The planting of pine and hardwoods in southern Ontario will serve to keep alive the lumber industry where it will otherwise surely disappear. The growing of hardwoods will be of especial importance to the manufacturers of Ontario. Planting by the Government and municipalities should receive their support.

### Dominion Government's Operations

A more advanced forest policy has been developed by the Dominion Government than elsewhere in Canada. The forestry work of the Dominion Government is all handled by the Forestry Branch of the Department of the Interior.

The Forestry Branch has charge of the fire protection of all Dominion timberlands, of the administration of the 16,000,000 acres of Dominion Forest Reserves, of the exploration of unoccupied Dominion lands in order to have the non-agricultural lands withdrawn from settlement and created forest reserves, of the planting of trees in the prairies, of the collection of statistics regarding the

forest industries of Canada and in addition is devoting considerable time to the propaganda work of forestry throughout Canada.

Fire protection on Dominion lands was extended in 1911 to the Athabaska, Peace and Upper Mackenzie Rivers. Unfortunately, the constant necessity of extending the fire ranging force to new territories gives but little opportunity for reducing the area covered by each ranger. Two steam boats were purchased by the Department for fire patrol on the Athabaska River. Rangers were maintained in all the new railroad lines being constructed through timber lands, these being the G. T. P. west of Edmonton and the Canadian Northern in the Railway Belt. Rangers were also stationed in all the districts where homesteaders are entering the forest land, where development is taking place and along all railroad lines operating through timber land. In 1911 for the first time railroads were required by law to carry each fire ranger free on all trains within his district. Another law passed in 1911, to be enforced in 1912, will require that all railways operating through forest lands will maintain a fire patrol along the track, and furnish such patrol with the most rapid means of conveyance. Certain Dominion fire rangers have been given power to inspect locomotives to see if the fire preventive equipment is such as provided by law.

A special inspection was made of the condition of the rights of way of the different railroads running through timbered lands, and where these were not such as is required by law, the companies were notified to undertake the work immediately. In most cases this was done.

### Forest Reserve Administration

The big task before the Forestry Branch is the administration of the Forest Reserves. The Rocky Mountain Reserve was set aside by Act of Parliament in May, 1911, making the total reserve area in Canada over 16,000,000 acres, an increase of 13,000,000 acres over the area in 1910. The first aim in administering the forest reserves has been to perfect the fire protection, the second to make the resources of the forest reserves accessible to the public under wise management.

A permanent staff has been appointed in each forest reserve, consisting of a supervisor, who is a man acquainted with the district, who is competent to handle business affairs and who is in sympathy with the idea of management, and forest rangers who are residents of the district and are active, capable woodsmen. Difficulty has been experienced in getting the proper class of men.

The rangers have acted as patrols in the fire season and have been employed on the improvements so necessary to proper fire protection. Fire lines have been constructed, trails extended and improved, and tool caches located, all with the idea of improving fire protection. This work will be continued until every forest reserve is as well protected as is possible. It is hoped to have this done fairly well in four or five years.

In order that as much might be gained from the United States as possible, leading officials of the Forestry Branch visited United States National Forests in Minnesota, Montana, Idaho and Washington and studied the improvements. The best of these will now be introduced on Dominion Reserves.

Regulations were revised to allow the use of the reserves by farmers, ranchers, lumbermen, miners and others. All the new regulations have not yet been enforced but grazing regulations have been adopted which provide for the issuing of permits for the grazing of stock in the forest reserves where no damage will result. Regulations have been prepared which provide for the sale of timber on easy terms, which will provide for the future of the forest and which will not be inconvenient to the lumbermen. All green trees to be cut on the forest reserves will be marked by experienced foresters. In order that timber sales may be conducted according to the very best information available, one official of the Forestry Branch spent the whole season of 1911 in studying forest and logging conditions on Dominion lands and investigating logging by the Forest Service in the same type of country in Montana. Wherever there is any amount of business on a forest reserve a trained forester is assigned permanently to the reserve as assistant to the supervisor to see that all operations are carried on according to the best possible methods.

The forest reserves do not interfere with mining operations. Provision was made in 1911 to lease to mining operators, on easy terms, sufficient surface rights for the operation of the mines.

The idea being followed in all forest reserve administration is that every user of the forest shall be met fairly and that the resources of the forest shall be wisely used.

Explorations were conducted in 1911 in Keewatin, Northern Manitoba, near Fort A la Corne, Prince Albert, Lesser Slave Lake, on the McLeod and Athabaska rivers, on the Porcupine Hills, Alberta, and in the Railway Belt, for the purpose of selecting lands for new forest reserves. Good timber was located in the vicinity of Lesser Slave Lake. It is expected that as a result of the season's

work several million acres of non-agricultural land will be placed under the administration of the Forestry Branch.

The work of planting trees in the prairie is developing with the increased settlement in the country. Nearly 20,000,000 trees have now been planted, and although these trees will compete little with the wares of the prairie lumber retailer, they will add much to the value of the country and will produce fuel.

The Forestry Branch collects each year complete statistics of the lumber and other forest industries, the results of which have been regularly published in the Canada Lumberman. A large mass of information has now been collected, and if any one desires any information concerning the forest industries or possibilities of any locality in Canada, it will be furnished by the Forestry Branch.

An investigation is now being conducted of the wood using industries of Ontario, with the object of learning what wood they require, what they pay for it, and where they get it. This, when published, will be very valuable to anyone with lumber to sell. It will contain some surprises.

The Forestry Branch is now undertaking to encourage the production of hardwoods in Canada by giving free expert advice as to the management of hardwood lands. A review of the situation has shown that an increasingly large amount of hardwoods is being imported each year and that there are large areas of waste land and wood lots in Eastern Canada which at little added expenditure would produce a good revenue from the growth of hardwoods.

The comprehensive report of the Commission on Forestry prepared in 1910 paved the way for action in 1911, but that action was not taken. It is understood that some policy has been under consideration for presentation in the coming session of the legislature, which will prove worthy of the greatest timber province in Canada. The present Minister of Lands and Forests has shown that he is alive to the situation, and has given considerable time during the past year to an investigation of various plans of progressive forest administration.

#### Private Companies Employing Foresters

A discussion of the progress of forestry in Canada would not

be complete without a reference to the work done by private companies and individuals. The work of specially trained foresters is slowly coming to be recognized as valuable to owners of timber land.

The Canadian Pacific Railway is the largest private employer of trained foresters in Canada. This railroad uses foresters to estimate the quantity of timber destroyed and damage due to fire on burned over land, to estimate and value timber limits offered to the company for purchase, to investigate the possibilities for future supplies of the timber, and to make inspection of and reports on the company's timber holdings in British Columbia and Ontario. More work of this kind was done by the C. P. R. in 1911 than in any previous year.

Another large and successful company which maintains a regular staff of foresters is the Laurentide Paper Company. This company has been for several years making estimates and surveys of its timber limits, and has been planning the best methods of logging. During this last year this work has been carried on to a greater extent than before,—exploration work has been carried on, a close estimate has been made of the pulpwood on a large area of timber land, studies have been made of the growth rates and habits of the most valuable pulp trees in the St. Maurice Valley, the logging operations of the company have been closely inspected to see that all timber is utilized and that reproduction of the most valuable species is encouraged. The result of this inspection has been that the forestry staff of the company are confident that they can improve on the logging methods so as to provide better for the future productivity of the forest,—an important point with a paper company,—and arrangements have been made to have a tract of some three square miles logged under the supervision of the forestry branch.

The year 1911 saw a development in the work of Canadian consulting foresters. Three or four firms are now doing work in Canada, and are being kept busy. The value of estimates and maps by reputable firms of forest engineers is rapidly coming to be recognized by lumber companies and timber brokers in Canada. The time is not far distant when no large timber property will change hands until it has been mapped and estimated by forest engineers.

berman by Hapsburg Liebe.

## Brazing

When everything has been done properly, with all things well prepared, the work of causing steel to stick to silver solder is a comparatively simple operation. There are, however, a number of factors that will prevent the laps adhering in the desired manner, and, with this in mind, one should be careful to have everything right before the hot irons are applied to the saw.

It has always been a practice of mine to take out one tooth in the making of a joint. One may save a little of the length by taking out less; but the change in the spacing sometimes causes the automatic grinder to do its work unsatisfactorily at the braze, or even to give much trouble because of the feed finger catching either two teeth or none. Most of the mills of modern make are so constructed as to furnish an abundance of room for taking out a tooth at each time of brazing, and the saw looks much better with this method of cutting.

First, I mark off, with the use of a true square and a scratchawl, the places at which I am to cut the blade—and I always allow a little over, say, for instance 1/16 inch, for dressing the 'cut' ends square and to a line. Then I cut the saw, with a well tempered chisel if I have no crosscut shear, on the lines. Next, I square and straighten the ends. Most lap grinders will do this; but, one not being at hand, it may be done quite satisfactorily with a file and square. Then I level the ends, being very particular to know that I am not leaving the smallest lump or ridge where the laps will come. This done, I measure back the width I want my laps, make a line with the scratchawl, and grind almost to it—right to it, if the machine is one that does good work, and almost to a feather edge on the end. To complete the work of making a lap, I take the saw from the machine and finish it by drawfiling, having been careful that the emery wheel has not been down hard enough to caseharden the surface and thereby causing the file to fail to take hold. Drawfiling, with care and judgment, makes a perfect surface. If one has no lap grinder, and must make his laps with a file, the saw should be clamped to a board, which may be fastened to the bench, or some other place where the filing may be done conveniently. And in this it is not a bad idea to leave half the lap off

the end of the board, so that the downward pressure of the file, bearing against the centre of the lap and the corner of the board, will have a tendency to prevent one filing the middle rounding.

Having finished the laps, if any time is to elapse before the actual work of brazing, the freshly dressed ends should be wrapped in clean paper, which is to guard them against rust or grease, or injury to the thin ends. Short blocks with slots saws in them are good to place over these ends to protect them.

## Testing the Irons

One of the most important features in brazing successfully is to have irons that are true. I cannot sufficiently emphasize this point. If they have been used before, they should be faced, testing with a straightedge, to make sure they are in good condition. Before trying them in the actual making of the braze, put the lower one in the clamp to see if its surface comes a little above the bed of the clamp, as it should, to prevent making a very noticeable ridge in the saw. Also be certain that the upper pad is in its proper place, not too low to hinder the placing of the hot irons, and not too high, which will cause a loss of time in running down the screws.

Care should be taken in placing the laps in the clamp, that they come together rightly. To clean the laps, I use emery cloth of a fine grade, rubbing the filed surface until there is no doubt that it is perfectly free from rust or grease. After this, however, the laps should be wiped off with a clean white cloth, as the friction of the emery and the steel will leave a little of black. White paper is good, also, after the emery cloth; wipe until no black is visible on the paper. The solder should be wider than the width of the lap, which allow for its slipping slightly out of place when the irons go on.

A great many filers use a brazing flux, or paste, or compound; some with success, others not so fortunately. A goodly difference of opinion prevails here: many use muriatic acid for cleaning the parts; many use lime; however, if one is getting good results from any method it would be unwise to throw it aside for any other untried way. If acid is used, it should be chemically pure. A little zinc

is good for purifying acid; also it is said to have a good effect on the laps, rendering them more willing to meet the solder. My method is to roast pulverized borax, thus freeing it from gases, which I pulverize again and dust sparingly over the solder and laps. Most coal contains a large percentage of a certain gaseous element, and as this element is not favorable in the operation of jointing band saws, the brazing fire should be well burned to a dry, smokeless coke before placing the irons to heat. Charcoal makes the best fire for braxing, although it may take longer to heat the irons to the desired degree.

Watch the irons continually during the process of heating, as they may become sufficiently hot in one place to melt, while at another point they may be barely red—unless you have a special forge for the purpose. Have the heat extend two inches farther than the width of saw, either way. As to color, for my part I prefer a heat a little above a bright red; this will allow the scale to be removed readily with a scraper made for the purpose, or even an old file, and allows a little of cooling during the time between the drawing of the irons and their being placed on the saw. Put them in the clamp squarely with each other, and be careful that the first, or bottom, iron is not in place so long before the other that the solder has time to curl to one side from the heat without pressure, thus spoiling the joint. Many a braze has been spoiled in this manner.

#### Applying the Pressure

Put the pressure down hard and quick—hard and quick, remember, then stop. Don't follow the old rule and tighten down from time to time as the irons cool to take up the shrinkage; it can do no good, because the crucial moment is past when the shrinkage begins, and if the braze hasn't caught tightening of the irons cannot help at that stage. There is, of course, a bare possibility that it might do harm.

Watch the irons closely, and when the red is all gone from them take them off. Concerning the different processes used at this point in the game for purposes of stiffening, I have nothing to say—except that if one applies anything to the warm joint it should be either air from a fan, warm oil, or cold iron, and not water. I think the finest braze I have ever made was cooled with water after removing the irons; but I made several others, which were cooled with water in apparently the same manner, that broke very soon. My present method of stiffening brazes is brought to bear after I have done my dressing, leveling and tensioning.

On taking the saw from the clamp, I move it directly to the bench, with the joint on the leveling block, where I leave it until it is cool enough to handle with bare hands. Then I bend the saw both ways, trying with a knife blade to see if there is any portion of it that has failed to stick. If I find a very little flaw, I file it out, going down to where the solder and the steel are united solidly, and I remember to dress none at all on the opposite side at this place, which helps even matters in regard to having made the blade slightly thin at this point. If I find a flaw of any serious nature, I put a fresh piece of solder between the laps, together with a little borax, and put the irons on again. This will usually serve; but one should not put hot irons on the saw too many times at one place, as it softens and rots the steel.

In dressing the new joint, I throw off the roll belt, and use the roll as a clamp at one end of the bench. Then I put a small pulley on the levelling block, directly under the braze, and clamp the saw firmly at the end of the bench opposite the end having the roll. With my hands I turn the roll until the saw is drawn tightly over the pulley. This will test the soundness of the joint, as well as

put it in a fair position for dressing with a file: If the braze is not good now is the time for it to show up—and not on the wheels. Care should be observed in dressing the braze that one does not file into the sound part of the saw; this will weaken the blade, concentrate the bend, and cause fracture at an early period if it is of much depth. After dressing the joint smooth on both sides, I scour it with a coarse grade of emery cloth, level, tension, and look to the back. After leveling and tensioning, I scour again with the emery cloth, making a perfectly smooth surface; it is a well known fact that a polished surface does not break so readily as one that is rough. And then, it looks better.

To stiffen, I heat a brazing iron red hot, and hold it near to the freshly made joint, under the saw, until I see the saw turn to a dark straw. I keep a bit of oily waste ready, and if the color runs over to a pigeon blue on one edge before the other is drawn to a straw, I rub the color back. After drawing in this manner, I allow the braze to cool, then level and tension again, the latter being necessary because the heat will in a measure distort the condition of the blade. That there are some who will not agree that there is virtue in this method of stiffening, I do not doubt. I use it because I know it cannot hurt, because it is of some benefit; I do not claim that it will restore the original stiffness. Nothing could do that but tempering.

A word in regard to the proper width of laps. On log bands, I use  $\frac{5}{8}$ -inch laps on all saws up to 12 inches; on the latter I increase the width to  $\frac{3}{4}$  inch; on blades 14 inches wide I use a lap of  $\frac{7}{8}$  inch.

#### The Teeth

The spacing of band saw teeth was, but a very few years ago, a subject of much controversy among mill men and filers; but, from my observation, it seems that the  $1\frac{3}{4}$ -inch spacing is the favorite for log sawing. However, a number of successful filers are using spacings a little longer or a little shorter, and appear to be pleased at the results. The idea, as it comes to me, is to have a spacing of teeth that will permit the point to take just so much of a cut. If the teeth are too closely spaced for the timber sawn, there will not be enough for each tooth to cut to prevent scraping; if the spacing is too long for the work in hand, each point will have so much to do that it will wedge its sides and choke with dust.

The shape of tooth should depend on the width and thickness of saw, and the kind of wood to be sawn—the latter might be said, with the same meaning, the amount of feed on an average. Hardwood takes a slower feed, and, therefore, requires a tooth with a little higher back than that used in softwood. The softer woods are usually sawn very fast, and the back of the tooth should not be so high that it rubs the timber behind the point. Enough pitch of tooth should be carried to prevent the saw going back on the wheels when in the cut, but not enough to cause it to run forward very far. However, if the blade comes forward slightly when it is fresh and sharp, it is more apt to stay in its place when the keen edge is gone. The throats should be kept well rounded to prevent a concentration of the bend, an invitation to fracture. When iron is struck, if no more than four teeth are stripped out, and if there is enough left of the teeth to permit the grinder finger to catch them, the teeth behind the crippled place may be slanted downward gradually and made to cut the kerf of those that are absent.

The estimates of the Canadian Government for the coming year include an appropriation of \$335,000—an increase of \$100,000—for the protection of timber in Manitoba, Saskatchewan, and Alberta, the Territories and the British Columbia Railway belt.

## EDGINGS

## Ontario

The R. Laidlaw Lumber Co., Toronto, have increased their capital stock from \$300,000 to \$1,000,000, fully paid up.

Extensions are being planned for the planing mill at Milverton, Ont., and the intention is to undertake the work immediately.

The wood-working factory of the St. Mary's Wood Specialty Company, St. Mary's, Ont., was badly damaged by fire on January 20th. The loss is estimated at about \$20,000.

The Graves Bigwood Co. started hauling logs January 2 at Byng Inlet, Ont., in spite of a temperature of 28° below zero. The box factory renewed operation the same day, after a week's shut down for repairs.

It is reported that J. Coleman, of the Gaste Cigar Company, London, Ont., and B. V. Hole, London, are having plans prepared for the erection of a cigar box factory, and that a quantity of machinery will be required.

Leaman & Company's sawmill at Lakefield, Ont., was recently destroyed by fire. The mill, which was formerly owned by Tait & Lillicrap, had not been operating for several months. It is believed that the fire was of incendiary origin.

C. F. McArthur Limited, Kenmore, Ont., have been incorporated with a capital of \$50,000 to deal in lumber and all building materials. The provisional directors are A. McArthur, M. Warner and D. J. Carkner, all of Kenmore, Ont.

John Harrison & Sons Co. Ltd., Owen Sound, Ont., will shortly install two boilers, not less than 100 lbs. steam, 66 in. x 14 ft. They also intend to install a filing room outfit for 12-in. double cutting band saws and one log jack and chain.

The ratepayers of Listowell, Ont., have voted in favor of granting various privileges to Andrew Malcolm Furniture Company, of Kincardine, on the condition that the Listowell Furniture Company's plant be taken over and operated to its limit.

The Eyer Lumber Company Limited, Toronto, Ont., have been incorporated with a capital of \$200,000 to carry on business as lumber and timber merchants, saw mill owners, &c. The provisional directors are J. H. Eyer, G. S. Lay and H. Wright, all of Toronto.

It has been widely reported in the daily press that the Edward Hines Lumber Company of Chicago have purchased the large new sawmill erected by the Shevlin-Clarke Company at Fort Frances, Ont. The Canada Lumberman is informed by the Edward Hines Company that the report is untrue.

There will be offered for sale by Public Auction at the Russell House, Ottawa, on May 8th, at 2.30 p.m. two timber berths, Nos. 196, 197 and 198, River Coulonge, Province of Quebec, containing 138½ square miles "more or less." The sale subject to a reserve bid. Information may be secured from J. C. Browne, 25 Sparks street, Ottawa, Ont.

At a largely-attended joint meeting of the City Council and the council of the Board of Trade of Sault Ste. Marie, Ont., it has been unanimously decided to grant concessions to the Lake Superior Paper Company to the extent of exemption from taxation for twenty years, in return for the doubling of the plant now under construction and the employment of 500 more hands. The doubling of the capacity of the 200-ton mill means the early construction of several subsidiary companies which can use by-products successfully.

The Holt Lumber and Timber Company, Chicago, Ill., who have owned timber limits in the township of MacKenzie, Parry Sound District, Ontario, for several years past, commenced operating upon them this winter. Their limits are estimated to contain about 150,000,000 feet of timber much of which is a good quality of white pine. They have put in six camps this winter and are taking out about 8,000,000 feet, which they will drive down the Magnetewan River. The western boundary of their limit is about thirty miles up the Magnetewan. They have not yet decided how they will dispose of the logs. If they have them sawn they will probably be taken down to the south shore of Georgian Bay. They may however, sell them in the log. The company intend to go in more extensively for lumbering in Ontario in future and will probably soon be cutting many million feet.

## Eastern Canada

The Bic Pulp and Lumber Company of Ste. Cecile du Bic, P. Q., have obtained a charter.

Hubert Couture and D. Gustave Rheault, D'Israeli, P.Q., have registered as the Eastern Townships Lumber Company.

A \$5,000,000 company, to be known as the Consolidated Pulp & Paper Co., is applying for incorporation at Fredericton, N.B.

Chas. Gingras and Leo David are reported to have registered to carry on a sash and door factory as Gingras & David, at St. Rose, P. Q.

Among those who suffered loss by the recent fire in the Halifax Herald Building were the St. Croix Paper Company who had offices in the building.

The sash and door factory of Mr. Joseph St. Louis, Simard avenue, Montreal, has been destroyed by fire. It was a two-storey structure and the loss is estimated at \$4000.

Atkins Brothers, Limited, Fairville, N.B., have been incorporated for the purpose of carrying on a business of manufacturing lumber into building materials. The capital stock is \$24,000.

A. Barre, Granby, Quebec, is reported to have bought the factory and buildings of the Michel Bruneau estate with the intention of using them for a sash and door and general wood-working business.

The E. B. Eddy Co. Ltd., Hull, Que., are preparing plans for new reinforced steel concrete bulkheads and side walls to surround their present forebay, a power house of reinforced concrete, new water wheels and new hydro-electric plant having 3 units of turbines and generators to develop 4,500 to 6,500 h.p. Their present pulp mill will be removed to make room

for a large central hydro-electric power house, and equipment. A new fire-proof reinforced pulp mill will be built on the Aylmer Road. All buildings are to be absolutely fire-proof and to contain the latest equipment and machinery.

The Meyer-Thomas Co., box manufacturers, Granby, Que., have purchased a building adjoining their present premises and intend to extend their business. They will be in the market for new wood-working machinery.

J. L. Black & Sons, Sackville, N. B., have purchased the lumber property of Arthur A. Hicks, at Cookville, N. B. The transfer covers 1,000 acres of log land, together with steam mill and mill property and standing timber on several small lots.

Leveille & Marion, wholesale lumber dealers, Montreal, have dissolved their partnership and the business will be carried on by J. P. Marion. Mr. Marion contemplates making considerable enlargements in the company's business. The company recently had an unpleasant experience, when thieves broke into the office at night and stole a typewriter and a few other supplies amounting in value to about \$150.

A large British Syndicate who own their hardwood limits on the west coast of Africa are erecting a veneer factory at or near Montreal. The Watrous Company of Brantford, Ont., have the contract for the equipment. Detailed information may be secured from Mr. Fuchs, Engineer of the Watrous company. The Capital Machine Company of Indianapolis, U.S.A., are also supplying some of the machinery.

The Consolidated Pulp and Paper Company, Fredericton, N.B., are applying for incorporation. Those interested include, A. H. Hannington, Thomas McAvity and H. W. Schofield, secretary-treasurer of the Partington Pulp and Paper Company, all of St. John, N. B. The capital of the proposed company is to be \$5,000,000. The company, it is understood, are considering the purchase of the Gibson lands on the Nashwaak River, where robbing and paper mills will be established.

Percy Block, of Amherst, N.S., and associates have formed the Maple Leaf Lumber Co. with headquarters at Amherst. The company is capitalized at \$200,000, Mr. Block being the president. The company owns about 30,000 acres of timber land on Folley, Berberth and North Rivers in Nova Scotia. It is estimated that there is 140,000,000 feet of lumber on this property, mostly spruce, with a small percentage of hardwood. The company already has made arrangements for cutting 6,000,000 feet this season.

#### Western Canada

Calbraith & Sons of New Westminster, have purchased and will operate the Lincoln sawmills at Langsley Prairie.

The B. C. Lumber Co., New Westminster, B. C., have secured a permit for the erection of their main building on Lulu Island, at a cost of \$36,588.

Aurbuthnot & Helmer, 644 6th Avenue, West Vancouver, intend to erect a sash and door factory at 995 6th Avenue West. The building is to cost \$3,000.

The Brandon Construction Co., Brandon, Man., are converting one of their shops into a woodworking factory, for which new machinery is being secured.

The O. K. Lumber Company Limited, Kelowna, B.C., has been incorporated with a capital of \$100,000 to carry on business as timber and lumber merchants, saw and shingle mill proprietors, &c.

The Electric Lumber Company Limited has been incorporated with a capital of \$100,000 to carry on business as saw mill owners, lumbermen, timber dealers, &c., with head office at Vancouver, B.C.

C. B. Weatherway has purchased the mill and machinery of the Stout Shingle Mill, Blaine, B.C., having a capacity of 225,000 shingles per day, for about \$45,000, and will commence operations in a short time.

The Brooks-McKenzie Lumber Company Limited, Penticton, B.C., have been incorporated with a capital of \$25,000 to carry on business as saw mill owners, timber merchants and to deal in lumber of all kinds.

The owners of the Terminal Construction and Manufacturing Co. Ltd., Vancouver, B.C., are preparing plans for a plant to replace the one which was destroyed by fire on December 29th. The building will be commenced shortly.

The Western Box & Shingle Mills Limited, Nelson, B.C., have been incorporated with a capital of \$25,000 to carry on business as saw mill, shingle mill and pulp mill proprietors, dealers in timber, logs, ties, crates, boxes, &c.

Pacific Properties, Limited, have been incorporated with capital stock of \$250,000 and headquarters at 615 Hastings street west, Vancouver, to deal in properties of various kinds, including timber licenses, timber leases, timber berths, etc.

The Pacific Door Manufacturing Company, 402-6 Pacific Building, 744 Hastings street west, Vancouver, have been incorporated with a capital of \$18,000 to carry on business as saw millers, lumbermen, &c. J. S. MacKay is Attorney for the company.

The A. R. Robers Lumber Company, Limited, Enderby, B.C., will be known hereafter as the Okanagan Saw Mills, Limited. There will be no change in the management, Mr. F. S. Stevens continuing as general manager, assisted by the same office force.

The Timber Realization Company, Metropolitan Building, Vancouver, B.C., have been incorporated with a capital of \$100,000 to carry on a lumber and timber business in Michigan, British Columbia or elsewhere. Robert S. Babcock is Attorney for the company.

The Port Hammond Lumber Company Limited has been incorporated with a capital of \$50,000 to deal in timber and lumber of all kinds and to construct tramways, roadways, bridges, reservoirs, &c., the head office of the company to be at New Westminster, B.C.

Details of the assuming of the management of the Swanson Bay Forests Wood Pulp & Lumber Co. Ltd., by Evans, Coleman & Evans, of Vancouver, have been published stating that the company is capitalized for one and a half millions, and was organized in 1909. Pulp wood leases of 84,000 acres are in the possession of the company, as are some timber lands, the townsite of Swanson Bay, a 20-ton sulphite plant, a 60,000 ft. capacity saw-mill, etc. Pulp has been shipped from the plant for some time.

## The Barnhart Log Loader

has been in successful operation in all parts of the country for twenty years and never caused a complaint. We are now manufacturing a new Barnhart Loader known as Model "12," which is specially designed for use in very heavy timber. This loader is built on the same lines as the old Barnhart Loader now known as Model "10" and which we still continue to manufacture. We are operating lumbermen, producing 200,000,000 feet of lumber per annum and we use the Barnhart Loader exclusively. Could we afford to do so if it were not the best? Write us for prices.

### Signs of Improvement at Montreal

Montreal, Jan. 27.—Although business in the retail lumber trade has been slow, owing to winter conditions, wholesale houses report a satisfactory volume of inquiries and a moderate trade. There has been a slight improvement as compared with this time last year, and what is more satisfactory, a decided tendency towards a higher range of values, one firm reporting an advance of 50c. to a dollar per 1000 ft. for mill and box culls, for forward delivery. In hardwoods there has been quite a brisk demand, with prices firm. All circumstances point to a favorable spring business, and arrangements are being made on that basis. Door and sash manufacturers continue busy. Stock-taking is now over, and inquiries show that generally the results of the year's operations have proved very satisfactory.

The news paper mills are all very busy, and well pleased with last year's business; they are also looking forward to an excellent twelve months' trade.

The United States Treasury Board has ruled that European sulphite pulp when manufactured in Canada into news paper for shipment into the United States cannot be admitted under section 2 of the United States tariff, it having been decided that the paper must consist entirely of, or be the product of, Canadian pulp wood. This is interesting to Canadians, as it indicates that the agitation to abolish the U. S. duty on paper and sulphite in favor of Europe will not be permitted by the U. S., where the question is now before the customs board. Canadians will no doubt consider this decision satisfactory as far as it goes, as it leaves the present tariff arrangements undisturbed. There has been, in the opinion of many, too much disturbance in tariff matters during the last two or three years to suit manufacturers, as a fixed policy in tariffs always tends towards better business conditions.

The latest reports from Europe indicate that water conditions have not improved sufficiently to create any higher production of ground wood pulp, nor has the output of sulphite pulp increased, so that both these commodities are selling at very high figures, and a shortage in both is feared during the remainder of the winter.

Messrs. S. P. Musson, Son & Co., Barbados, West Indies, report as follows under date of January 5th:—Lumberstuffs—white pine—The only arrival during the fortnight is the Trn. Schr. "Success" from Sheet Harbor, N.S., with 201 m. ft. which had been sold to arrive some time ago at \$32 for merchantable, and \$24 for second

quality. There is another cargo on the way also sold to arrive, and as dealers are already fully supplied, prices are likely to decline for any further arrivals. Spruce—No arrivals during the fortnight, but market is fully supplied. Pitch pine—No receipts, but the small lots which have come to hand regularly during the last few months have kept the dealers supplied. Shingles—No receipts of either Gaspé or Cedar laying, both of which are in good demand, especially the former. Shooks—Receipts consist of 200 bdls. ex "Guiana" and 488 bdls. ex "Coppene" both from New York and 3,055 bdls. ex "Cromarty" from Halifax. All of these lots have been imported on dealers' account. Wood hoops—No arrivals.

Kenneth M. Clark, one of the woods superintendents for Appleton & Sewall, foresters of Bangor and New York, has just completed making a set of topographical timber maps for 250,000 acres of timber land in Nova Scotia owned by the Davison Lumber Company. The undertaking was one of the largest of this kind ever handled in Canada and occupied the services of five men since early last fall.

The value of United States exports of domestic forest products for 1911, \$103,000,000, is the highest yet reached. The exported lumber was valued at \$60,000,000; timber and logs, \$17,000,000; the naval stores, \$25,000,000.

The imports of forest products in 1911 were valued at \$164,000,000, and came within \$15,000,000 of equalling the total of 1910, which holds the highest place. India rubber was imported to the value of \$76,000,000; other gums, \$26,000,000; lumber, \$21,000,000; wood pulp, \$14,000,000, an import that has doubled in value in four years.

Receipts of lumber by vessel at Saginaw River points during 1911 amounted to 88,056,928 feet of lumber, 6,309,800 lath, 150,000 shingles, and 1,128,467 pickets. About 70,000,000 feet of the lumber came from Ontario and paid tariff dues of \$1.25 a thousand feet. The remainder came from the Lake Superior district mostly. Only one cargo of lumber was shipped out. Receipts at Bay City were 58,298,624 feet of lumber, 2,555,500 lath, 150,000 shingles, 10,869,600 feet of unmanufactured sawlogs and 1,128,467 pickets.

### Prices Advancing at Montreal

A prominent Montreal wholesaler sums up the lumber situation as follows:

Editor Canada Lumberman:

The lumber business in Montreal for the year 1911 was a little better than 1910, but not any too good for lumber merchants like myself. Manufacturers were the ones that were the most prosperous, realizing good prices for their lumber. At present there is a strong indication of 1912 being a very good year, as prices are advancing every day. I know in my own case lumber that I could not sell three months ago at \$14.00 per thousand, I am getting an advance of from \$2.50 to \$3.00 per thousand.

# Jenckes Boilers

## Mr. Lumber Dealer

We wish to call your attention to the selling proposition of our new famous MULE-HIDE ROOFING, unequalled by any Canadian manufacturer.

We are devoting our efforts during 1912 to placing our products through the Retail Lumber Dealer, as we believe it to be a line specially suited to be handled by a Lumber Dealer in connection with other building supplies.

MULE-HIDE ROOFING is being sold all over the country from coast to coast, and is giving universal satisfaction. All the goodness that has been possible to incorporate into a high grade roofing has been put into MULE-HIDE. You get genuine quality that have lasting and resisting power over any other. It is the toughest and most durable Roofing on the market.

## Mule-Hide Roofing is sold with a Ten-Year Ironclad Guarantee

of money back if goods are not as represented.

### Here is Our Proposition :

We have planned a local advertising campaign for every dealer who handles our line. It is the most effective aid ever given to dealers and is entirely new and in advance of anything ever done in this line. It is all planned at our office and done at our expense. We not only advertise our Roofing for you, but we put on an advertising campaign in your locality that will make your name and your goods a household word—and mind, not a cent of expense to you. Are you alive? Are you up-to-date? Will you spend a two-cent stamp to investigate? If so, fill in the coupon below and mail to us. Delays don't pay—our proposition does.

# Elmira Pulleys

The installation of Elmira Pulleys is in itself a guarantee of the efficiency and satisfactory working of the power transmission in any plant.

In the end they are also the most economical. They last longer and cause the minimum trouble and cost for maintenance.

The waste of power due to wear is infinitesimal and the transmission of power is accomplished steadily and noiselessly in any direction.

Elmira Pulleys are recognized as the strongest on the market—guaranteed to be made of the best material, they will run true, hold the shaft and stand the wear and tear of years without causing any troublesome and costly repairs.

Elmira Pulleys are strongly connected, the wood segments are firmly glued and then nailed together. Such care is taken over this process that the surface of the pulley has never been known to cause any trouble whatever.

When the pulley is installed with the "Elmira" Hanger the combination forms a most reliable and effective system of power transmission.

In the "Elmira Hanger" a union system of oiling is employed, a combination of centrifugal and capillary attraction effected by tempered steel rings and woven cotton wick. This method guarantees a thorough distribution lubricant and precludes all possibility of dry bearings.

The "Elmira" line of Hangers is without doubt the heaviest and strongest on the Canadian market, and while in no sense can they be considered competitive their prices cannot do other than appeal to those desiring a strictly first-class article.

Catalog giving prices and full particulars of our appliances sent on application.

# DISSTON SAWS

ARE THE **STANDARD** BY WHICH

THE MERITS OF ALL OTHERS ARE

# JUDGED

A SAW TO BE SUPERIOR IN EVERY RESPECT must be made of a steel of such peculiar quality and texture that will "take" the hardening and tempering to the greatest degree, giving the highest temper, retaining the necessary toughness and elasticity which admits of the springing of the points of the teeth in the setting and at the same time being so hard that it will maintain the set and cutting edge the longest time. The blade must be ground an even thickness on the entire tooth edge, properly tapered to a thin back for clearance and the teeth of such shape as to enter into and cut—not tear—the wood.

**These are the Principles on which Disston Saws are Built**

Having over Fifty-six years' experience making steel in our own works, producing a material especially adapted for saws; employing the most skilled Workmen; using exclusively Disston processes of hardening, tempering and grinding; and with Seventy-one years' experience in the manufacturing of saws, during which time no efforts or expense were spared to achieve and maintain THE HIGHEST STANDARD OF QUALITY AND DESIGN, we are warranted in claiming.

**Disston Saws are Unequalled for Material, Workmanship and Efficiency**

**Disston Saws Run Easiest,  
Cut Fastest and Last Longest.**

## In Trimmers We Lead Them All

**A CLARK PACIFIC COAST TRIMMER**

Saw frames perfectly balanced.

Saws locked down and cannot lift.

Excepting at will of the operator.

Saw frames telescope for tightening belt.

Saws are 30" to 34" diameter.

Trims stock 8" to 10" thick.

Counter shaft Bearings adjustable in both directions.

Built with any desired width or length table.

Any number of saws.

Variable feed furnished when desired.

We furnish iron work only, but supply plans for all woodwork.

A heavy rigid durable and accurate machine.

We equip the above machine with pneumatic single acting cylinders and operator's keyboard when desired.

Our special trimmer catalogue is worth having. In addition to eight different styles of trimmers we build every machine required in an up-to-date Band or Circular Saw Mill.

**Clark Bros. Co., Belmont, N.Y.**

Coast Office: White Bldg., Seattle, Wash.

# Automatic Box-Board Squeezer

## BUILT IN FOUR SIZES

Will assemble all kinds of matched stock used for packing boxes. Can be changed to handle entirely different sized stock in less than two minutes.

Saves labor and by making the tongues and grooves fit tight the finished product handles practically as one piece.

We also manufacture :  
Horizontal Slab Resaws, Horizontal Hopper Feed Box Resaws and many other Special Box Factory Machines.

**Mereen-Johnson Machine Company,** MINNEAPOLIS, MINN.  
U. S. A.

## Everything for the Saw Mill

Our Lath Mill

Our Two Saw Edger

We can equip your saw mill with everything from the motive power to the trimmer. Our complete line of saw mill machinery cannot be surpassed. Every machine is complete, simple and a model of good workmanship.

Write for our literature and prices, they will interest you.

**MOWRY & SONS,** - **Gravenhurst, Ontario**

## Go and see the new BERLIN fast-feed matcher in operation

The mill is the laboratory in which the durability of a matcher is shown. A year's run will disclose more weaknesses and show the need of mechanical efficiency more clearly than any testing out the manufacturer could give.

And the great improvements made in the wood-working field today are due to our initiative in the direction of fast-feed machines.

### Pioneering

When we brought out the first fast-feed matcher ever built, a howl of skepticism rose up.

Competitors scoffed, and most lumbermen didn't believe a word of our advertising.

We told then as we tell today, the absolute truth in our announcements.

The first fast-feed matcher was the "94." It produced a better quality of work than other machines and at double the rates of feed.

Yet the "94" as compared with the latest Berlins is like the automobile of today and that of several years ago.

It paid its way. The hundreds and hundreds installed were gilt-edged investments. Yet we have been blamed because the "94" wasn't developed twice as fast as anything else in the machinery world.

### Further developments

After we had proven that a hundred foot feed was practical, the other makers of wood-working machinery clambered into the race.

Patents don't always protect and it didn't protect us then or now. If you notice mech-

anical construction you will find our improvements being adapted regularly.

Take the Berlin round cylinder head for example. In the first one we built, the screw which held the gib in place against the knife, passed through a portion of the head itself.

The principle was wrong. We replaced every head we had out. Yet that same style of head is being sold you today on other machines.

The Berlin cylinder head of today is the only durable head offered the buyer. It can't wear out. It's almost one solid piece. Ask any user.

Go and see one of the latest Berlin matchers in operation. And look carefully at the head construction. Compare it with others.

### Testing side heads

We soon found out that fine cylinder work must also be followed by equal side-head production.

A new head department was organized. Our pin type twelve bitted matcher heads were developed. The expansion feature was invented.

Today we have the only complete line of fast-feed side-heads in the world. There's the special ship-lap heads, matching heads, double tongue and groove heads—a complete line.

If you are unfamiliar with the completeness of our side-head line, let us send you a copy of a new booklet, 48-page, "Berlin Heads and Specialties."

Let us mail it to you. It tells the reason for the quality of our side-head work.

### The feed drive

From thirty gears, we have descended to almost none. On the latest Berlin fast-feed matcher there is but five.

Our frictionless chain drive is by far the most successful matcher feed works drive today. Its life is as yet unknown.

The Diamond chain runs smoothly and without perceptible wear. We used the chain drive on our No. 108 Moulders for the last eight years. We have never replaced a chain.

Competitors say "it will wear out." We leave it to your judgment. Certainly, it will stand ten times the strain we put it to.

Fire engines, motor trucks, of 60 H. P. and better, racing cars of 200 H.P. use the Diamond Drive and it is used for heavy duty.

The chain drive does away with all complications. Shavings don't stick. And we'll guarantee the wear. That's the last thing we think of.

### The result

The result of our years of experience in the fast-feed field is shown by the volume of our business.

We have created and put out more improvements than all other makers combined. Our line is high-grade and medium priced.

The results show in our latest machines. Go and see them in operation. Notice the profiling attachments and its simplicity.

Be sure and notice our line of heads. Go and see a machine. Ask us where you can see one running.

# THE ELIMINATION *of* EXPANSION GEARING

## *Plain Facts, No. 3*

Speaking of a system of feed on a Planer and Matcher, our attention was recently called to a statement of a contemporary concerning his machine as follows, "In no case does a gear on our machine receive and transmit the power through the teeth *except in the case of expansion gears.*"

Please note the *exception* in the above quotation.

If you are familiar with the No. 77 Planer and Matcher, you know that there are *no* expansion gears in *its* construction.

Do you know the purpose of expansion gears? Of course you do. They are an *excuse* for not being able to drive the rolls direct; and, like all excuses, they are weak. True, they have to be used on some classes of tools, as for instance, a timber sizer; but they are out of place on a 200-ft.-per-minute-Planer and Matcher.

There is a very good reason why our system of feed on the No. 77 is not copied just now,—it's patented.

We have photographs of the feed on the No. 77 with the covers left off, exposing all the gearing. We will send you a set of these pictures if you are interested in this important fact concerning the feed of a High Speed Planer and Matcher.

*Write us direct or our sales-office nearest you.*

## Band Saws, Jointers, Saw Tables, and Swing Saws

Silver's New Wood-working Machines are Newest, most improved tools on the market. The cuts give a slight suggestion of their neatness of design and construction. In rigidity, in ease and convenience of operation, in moderate price, they beat all others to a frazzle.

Silver's Machines are high-pressure machines  
They will do your work to the limit and do it well

JOINTERS—8, 12, 16, 20 and 24-inch  
BAND SAWS—20, 26, 32, and 36-inch  
SWING SAWS—6½, 7, 7½ and 8-foot  
SAW TABLES—Two Styles

Send for 1911 Machinery Catalogue  
and Special Prices at once.

## Makes It's Mark Vivid and Lasting

Marks that remain vivid and wear like Iron are a real satisfaction to the man who handles lumber. The metallic pigments, like graphite, of DIXON'S LUMBER CRAYONS offer marvellous resistance to all kinds of weather conditions. Their mark are often visible after six months of severe exposure to sun and storms.

## DIXON'S LUMBER CRAYONS

have always remained the recognized standard because of their one, uniform and dependable quality; their convenient and uniform shape and size and because of the careful selection of materials used in their manufacture. DIXON'S LUMBER CRAYONS are made in nineteen grades and colors, including black (six grades), red, (two grades), blue (two grades), green, white, yellow, brown, terra cotta, violet, pink and orange. Some are made to fill particular needs—let us tell you more about them. Get acquainted.

Write for lithographed booklet No. 239, illustrated in colors.

Jersey City, U. S. A.

## CONSERVATION

NOT FOR SENTIMENT BUT FOR PROFIT

With the increased value of timber lands to-day, owners are beginning to realize the need and importance of systematically handling their lands. Forest holdings can be made to bring a financial return in a remarkably short length of time and for an indefinite period thereafter, by using our methods of mapping, estimating and surveying.

A Large Land Company's Opinion of Our Work

"Just the Information Wanted"

Samuel F. Hersey Land Company,  
Bangor, Maine.  
Branch Office, St. Paul, Minn.  
St. Paul, Dec. 22, 1909.

Gentlemen,—

In reply to your inquiry of the 15th inst., we desire to say that the forestry work you did for us this year is entirely satisfactory to us. Your report and map were comprehensive and gave us just the information we wanted.

We shall undoubtedly call upon you again for further services of this character.

Very truly yours,

Samuel F. Hersey Land Co.,  
D. A. Mudge, President.

Messrs. Appleton & Sewall,  
Bangor, Maine.

We are PRACTICAL FORESTERS, make forest surveys, timber estimates, and abstracts showing character, and quantity of available timber, including the most approved methods of cutting each year so that there shall be no unprofitable depletion, and appraise for present and future worth. Our Booklet F, "Applied Forestry," will be of interest to you. Mailed upon request.

We are pleased to refer you to H. S. Ferguson, Engineer, 200 Fifth Avenue, New York City; Kathdin Pulp and Paper Company, Boston, Mass.; Bonne Terre Farming and Cattle Company, Bonne Terre, Mo.; Chicoutimi Pulp and Paper Company, Chicoutimi, P.Q., Canada.

## The Filing Room

### Something New

For nearly 20 years the Hanchett Band Saw Swage has been on the market. There are today nearly three times as many Hanchett swages on the market as any other swage. There are over 14,000 of them in use up to this date. They are long lived too, for many of the very first ones made are still in daily use. We have now made an attachment or die lever stop whereby the eccentric die may be adjusted to not turn past the anvil or to turn past the anvil as desired. This attachment will fit on any of the older Hanchett Swages. It is neat, solid and compact. Send for Catalog No. 2.

## INDUSTRIAL LOCOMOTIVES

Persistent specialization, careful testing of all materials and painstaking care in manufacturing have produced our standard locomotives for logging operations and switching around industrial plants.

These locomotives are the product of engineers and manufacturers who thoroughly understand conditions surrounding their use. These conditions require powerful and sturdy locomotives which will give maximum work for minimum attention. It is important that the boilers should be ample in capacity

and that they should be tight and remain so. Also that the machinery should be rugged for service with ample surfaces for wear. Parts that will wear should be accessible for easy renewal.

Our standard locomotives embody these features, combined with wide experience. To do yourself justice you should investigate them before purchasing.

Spare parts that are sure to fit are always on hand for prompt shipment.

## MONTREAL LOCOMOTIVE WORKS, LIMITED

BANK OF OTTAWA BUILDING, MONTREAL, CANADA

# HEISLER LOCOMOTIVES

## ARE USED IN CANADA

From Anticosti, P. Q. to Vancouver, B. C.  
for reasons given below

**HEISLER** truck frames are made from a minimum number of heavy steel parts independent of the gears, and are very strong, but flexible, and readily accommodate themselves to an uneven track. At the same time they are so constructed that they can never be thrown out of the square.

**E**very engine has but two pairs of heavy steel bevel gears.

**I**n all cases the gears are rigidly mounted, enclosed, oil-submerged and noiseless.

**S**pecial tools are not required on the road as the Heisler master gears are clamped to the driving cones of the enlarged axles and can be quickly removed.

**L**arge cylinders, marine type connecting rods, solid forged crossheads and pistons, adjustable case hardened links and single throw crank shaft, are some of the special features of the motor engines.

**E**very gear is mounted in rigid self contained, enclosing steel frames entirely independent of the truck frames; therefore no abnormal strains whatever can be transmitted thereto from the gears.

**R**igid universal central-shaft connections are made at the truck centre which eliminates telescopic slip, and with it the resulting destructive wheel-flange wear, track wear, and racking of the truck frame. In the Heisler Locomotive the truck swing is perfectly free on the sharpest curves and most uneven tracks.

**LOCOMOTIVES** have all bearings fitted with removable phosphorbronze bushing adjustable for wear.

**O**ver four fifths of the entire weight is of cast steel.

**C**ylinders and frame cast separate in order to facilitate possible repairs.

**O**nly one pair of eccentrics is used with a view to the simplest possible construction combined with the best possible working.

**M**otor engines are located to transmit the power through a center-shaft directly below the center of gravity.

**O**n the main frame the load is equally distributed.

**T**he Heisler is fitted with a large roomy enclosed cab made of steel and lined with non-conducting material.

**I**n case of derailment the side-rods of the Heisler Locomotive prove to be a special advantage, since, if a wheel drops between the ties, it is only necessary to block up under the side-rod crank-pins and slowly start the locomotive until it leaves the derailed driver; then apply the brakes to hold fast, and block the driver in the higher position.

**V**ery large fire boxes, liberal heating surfaces and exceptionally large steam spaces are features of the boiler which is throughout of the simplest and strongest possible construction.

**E**very detail of the entire locomotive is symmetrically designed and is up to the standard in workmanship and best locomotive practice. Spare parts always in stock.

**S**hafts, axles, connecting rods, piston-rods, etc. are made from hammered forged steel.

## Galt, Ontario

---

**No. 300 Heavy Duty Inside Moulder**

The advantages of a Moulder and a Planer and Matcher are combined in the machine illustrated above. Ease and speed in adjustment are insured through special unique features, not contained in any other type of machine. The method of lubrication is perfect. The general construction is after the plan of the planer and matcher, having heavy sides connected by heavy girths which in combination with a series of platen plates form the bed.

**No. 300 Heavy Duty Inside Moulder**

The special features of this model machine include truing devices for top, bottom and side heads, which insure all knives doing an equal amount of work. Six speeds are furnished through friction feeds. Top rolls are made with pull-out shafts, and extra rolls are supplied, all interchangeable. Matcher frames swivel, ample expansion for all bars and chipbreakers. Made in two sizes 15 x 6 and 12 x 6.

TORONTO MONTREAL HALIFAX WINNIPEG CALGARY VANCOUVER

# "Penny Wise and Pound Foolish"

is most surely the case when you try to economize by buying cheap belting. The longer you make a cheap belt last, the more it costs on account of stretch and consequent slippage, resulting in shut down to shorten and repair, wasting the time you are paying for in good dollars and cents. You lose power and money with every revolution of a cheap belt.

BEARDMORE LEATHER BELTS are acknowledged to be the best and everyday is proving this fact.

Let your next belting order be "BEARDMORE."

# Rapid and Easy Production Means Increased Profits For You

THE MADISON WILLIAMS NO. 4 SAW CARRIAGE

If you are having trouble in your mill you cannot be doing satisfactory business.

The first essential to good business is progress, and the first step in progress is up-to-date equipment. The Madison Williams No. 4 Saw Carriage contains all latest improvements and is recognized as the most efficient on the market.

In construction it is strong and rigid and each different movement when in operation is dead accurate and perfectly smooth.

These carriages are built in one or more sections to suit the length of logs to be cut. When more than one section is required we supply our automatic carriage coupling.

The Timber frame is of Long Leaf Southern Pine, well seasoned, securely braced and bolted together. The Knees and Log Seats are made of cast iron or steel and are mounted on the carriage in any desired position.

Racks and Pinions are steel and machine cut.

Set works are our Improved Double Acting Ratchet Type and with this set works is supplied a brass index wheel and pointer.

*Write us for Quotations on Saw and Lath Mill Machinery and Turbine Water Wheels*

**The Madison Williams Manufacturing Co., Limited**  
Lindsay, Ontario

# MAPLE LEAF SAWS

The Improved Racer Cross Cut Saw, by Actual Test, is the Fastest and Easiest Cutting Saw Made

The Maple Leaf saw is higher priced than the ordinary saw because it costs more to make it. It is made of the very highest quality of steel and tempered by a secret process which toughens and refines the steel. The Maple Leaf trade mark on the saw means that it is the equal, if not superior to any saw made. It also means that you are privileged to test it against any other make and if not found equal or superior in quality you can return it and have your money refunded.

The ambition of the manufacturers of the Maple Leaf Saws has always been to produce the best tempered saw in the world and they are constantly investigating and experimenting with this end in view. They have recently made some valuable discoveries in evenness of temper. It has always been difficult to get a perfectly even temper on long and thin sheets of steel, such as saws are made of. Our recent discoveries make this an absolute certainty. Every user of saws should bear in mind that the temper of the saw is its most valuable quality. High finish and attractive appearance amount to nothing if the temper is not right.

All Maple Leaf Saws are Guaranteed to be Perfect in Temper

**Shurly-Dietrich Co., Limited** Galt, Ontario

*Why not make 1912 the most profitable saw year in your history?*

## ATKINS STERLING BAND SAWS

Made in Canada

**T**HESE Saws are celebrated on account of their exceedingly tough temper and generally scientific construction. They will stand up to their work longer under the most trying conditions. You will find fewer cracks in ATKINS BAND SAWS than any other and they will hold their teeth and points remarkably. Why not place a trial order and make us prove these statements.

*Write to-day*

**E. C. ATKINS & CO.,** Makers of **STERLING SAWS** **HAMILTON, ONT.**

Vancouver Branch, No. 109 Powell Street,

U. S. Factory, Indianapolis, Ind.

**B**Y doing perfect work of this kind, (No. 117 Siding) at 200 feet per minute, the "Three-Double-Three" with profiler, is proving itself to be "The New Speed King." Heretofore the best record on No. 117 Siding was 150 feet. The efficiency of the high speed planers is now beyond doubt. The question now is—"Which is the *most* efficient?"

We can demonstrate to you both theoretically and practically, that the "Three-Double-Three" is at least 25 per cent more efficient than any other planer and matcher now made. Give us a chance. Special pamphlet and sample of this siding worked at 200 feet per minute, **FREE** upon request.

# THE SHIMER CUTTER HEADS

The "Shimer Limited" Cutter Heads with Expansion, Fig. 627 and 628  
Price, for Flooring, \$72.46 per set complete.

## QUALITY CUTTER HEADS

There's no luck connected with the making of a good Cutter Head. It's all hard, clear and concise knowledge and years of experience—it's the employment of the best materials used in the best way that enables us to make Shimer Cutter Heads as good as they are. When you buy them you eliminate luck and in its place get certainty—the certainty of getting thoroughly reliable, dependable and efficient tools.

The planing mill man who buys the Shimer Cutter Heads buys with the guarantee that he is going to be satisfied with his purchase. He has the privilege of trying them on his own mill and is both judge and jury in deciding on their merits. He's going to have a life-time of accurate service; they are made so strong, so safe and accurate that there is practically no wear out to them.

Shimer Cutter Heads are sold on a square deal basis. We want every customer to have the tools best suited to his work—to be satisfied before paying for them that he is buying something that will be a lasting benefit to him.

As most of the large lumber companies use Shimer Cutter Heads exclusively in their mills, it should take no long argument to show you that you can also use them with profit.

Remember, the excellence of our Cutter Heads made our reputation—the same preserves and enhances it.

Let us know what your requirements are in the way of Cutter Heads or Cutters. We guarantee satisfaction for every order you place with us.

### BIT GRINDING MACHINES

For sharpening Bits tempered too hard to file, and to lighten and hasten the work in the filing room, we make two styles of Grinding Machines.

No. 1 is a strong and complete machine with every needed adjustment. Price net, with countershaft, f. o. b. Galt, \$104.00.

No. 2 machine is lighter, yet sufficiently strong to meet the average need.

Price, complete, \$45.50 net, f.o.b. Galt.

### PANEL RAISER HEADS

We are putting out an excellent tool that will work nicely on any panel raising machine with vertical spindles. It is made in two sections, the one having a central hub, upon which the other section is slidingly mounted and fastened with a set screw. The knives for Jointing extend from the flange on one section to the other, held by means of special dovetail shoulders which encircle each knife near its ends. It carries a heavy shearing cut, and works smoothly across end of panel as well as with the grain.

Price, each Head with Bits complete, \$18.20

### Our Popular Cutter Heads

Figs. 202 and 203 are the leading tools, having Conical Duplex Bit Seats and The Shimer Cutter Head Expansion. Flooring Bits will work from 13/16 to 1 1/2-in. in thickness with tongue and groove proportions expanded to suit.

Price, net, complete with one set of flooring Bits, the gauges for setting the Bits and wrench... \$40.95  
Extra Bits for Flooring... 11.44  
Extra Bits for Ceiling... 10.40

With 4 Bits to Each Head

### Jointer Heads

Figs. 54 and 55, with four Bits in line of work, shear the cut downwardly to insure a sharp and clean upper edge. They cut clean and free and are shipped out under our guarantee to give satisfaction.

Price, Heads, complete with Bits for 15/16 to 1 1/4-in., net only... \$31.20  
Extra Bits 1 1/4 face, the set... 10.40  
Extra Bits, 2-in. face, the set... 12.48

### O. G. Batten Heads

Figs. 48 and 49, represent our best tools for this work, having 3 Bits in line of cut so arranged upon their seat inclines as to protect all but cutting edge against friction and wear.

Price, two Heads, complete with Bits, net only... \$31.08  
Extra Bits, each, net... 2.08

### Double Ceiling Heads

Figs. 45 and 46, are made in solid section, steel forged, with Bits of special design to cut two tongues on one edge of board, and two grooves on opposite edge, to be re-sawed for two thin boards tongued and grooved. Very complete.

Price, with one set of Bits, net... \$40.94  
Extra Bits, per set of (8)... 16.64

### Ship Lap Heads

Figs. 38 and 39, are made of steel forgings, in solid section, designed especially for heavy duty. The bit seats have the latest improved slants to provide free cutting edges, and we sell them at the following low and net prices.

Heads with one set of Bits to work 15/16 to 1 1/4-in. thick, net... \$34.84  
Extra set of Bits... 11.96

### Door, Sash and Coving Tools

That save all the hand fitting. No changing of patterns, therefore, no trouble in framing door and sash parts when matched with the Shimer Cutter Heads.

#### DOOR AND SASH HEADS

Fig. 82, solid flange, Door Head... \$10.75  
Fig. 84, Expansion Door Head... 13.35  
Fig. 86, solid flange, Sash Head... 9.75  
Fig. 206, Expansion Sash Head... 12.35  
Bits to work 1-in. to 1 1/4-in. Doors, 4... 7.28  
Bits extra to work 1 to 1 1/4-in. Sash (2 Moulded Bits, \$4.30; 2 Rabbeting Bits, \$2.86)... 7.16

#### COPE HEADS

Fig. 83, Cope Heads (2)... \$12.90  
Coping Bits, each... 1.43

### The Shimer Box Board Matching Heads

make a uniform cut and close fit, as well after years of use as when new, with no friction upon the Bits. For thicker material the Bits can be expanded.

Price for two Cutter Heads to match 3/4 to 1 1/2 inch, \$23.60.

We also furnish when desired a Yoke Mandrel with self-oiling boxes, boxed f.o.b. Galt, \$11.05.

Branch of  
Milton, Pa.

## Purchasers — And How To Locate Them

John Apsley Jenkins sells Hardwood trim. I met him yesterday, plodding along as though headed for the undertaker's. "Deucedly hard work digging up business—made nine calls to-day and not a dollar in sight" he confided.

Now, Jenkins is like nine out of every ten salesmen—spending their time making unproductive calls. They waste much time and good energy canvassing prospects that may want something, somewhere, sometime.

How can this waste effort be eliminated? How can knowledge of present and prospective markets be acquired quickly, efficiently, economically? How can this information be obtained, daily, from every town in Canada?

If you really want to know—drop us a line. Let us send you specimen reports relating to your business and explain our facilities for supplying you, daily, with information that will enable you to make sales.

**MacLean Daily Reports Limited**  
220 King Street West, TORONTO

## Favorite Shanty Range

is specially constructed for use in  
Lumber, Railroad and Mining Camps

This Range is substantially built of 14 and 16 gauge, specially prepared British Steel.

Note the malleable lift rings to accommodate poles for the portaging of the Range. This is a handy feature only found on the Favorite Shanty Range.

The top is large, the oven roomy and has the capacity to cook for fifty men.

The Fire Box is 31 inches long, being two inches longer than any other Shanty Range on the market. The Fire Door is unusually large to admit rough, coarse wood.

Size of oven, 25 x 27 x 16.

Capacity of Reservoir, 15 Gallons, Coal Linings, Water Front or Coil Water Back can be furnished with this Range when desired.

## Camp Favorite

This Stove is a powerful Heater. The body is made of extra heavy rolled steel in one sheet, rivetted and put together like a steam boiler. It is an absolutely safe Stove as there are no joints to get loose and leak ashes.

The adjustable shelves may be placed to give a level cooking top, or can be set down on the sides of the Stove to form foot rests.

Made in three sizes, 36, 42, 48 inches long.

Dimensions of Fire Door 13 x 15 inches.

Our prices are right and can make prompt shipment.

## 36" — 3 Saw Edger

We build edgers in the following sizes between frames : 32", 36", 42", 48", 54", 60", 66", 72", 84", 96".

A few points regarding our 36" edger worthy of consideration :

**FRAME** consists of one solid base, which supports three upright frames. Each frame is fitted with a mandrel bearing 7" long, lined with best babbitt.

**ARBOR** is 2½" in diameter and made from best machine steel.

**SAWS** Standard machine is fitted for three saws, one stationary and two moveable.

**SAW SHIFTER** We use a combination steel collar shifter and saw guide.

**END BEARING** can easily be removed by loosening two cap screws which allows saw to slip off end of mandrel.

# For Service and Results

**One Customer Writes—**

*"I have cut over 20,000,000 feet this last season and with your 'New Model' Bandmill have not broken or cracked a saw."*

It is not a question of what a Bandmill is worth per pound but what kind of mill will give the greatest service and the best results per dollar of cost.

## **WATEROUS 'New Model' BAND MILLS**

are built and sold on a basis of quality—exceptional cutting capacity, extreme accuracy and permanent satisfaction to the user.

Placed on the market in the fall of 1909 these mills represent the last word in modern Bandmill design.

Built strong enough to stand the heaviest work without vibration, so simple in design and with operating parts so well protected that they require practically no attention. Waterous 'New Model' Bandmills are fitted with a self-cushioning straining device and with improved and simplified saw guides that permit a speed and accuracy of cut unsurpassed by any mill on the market.

We build these mills as single or double cutters, in 8 ft., 9 ft. and 10 ft. sizes.

Over 30 have been sold in the last two years.

Numerous re-orders after one season's use and enthusiastic recommendations from those installations testify to their superiority.

# Edgers for Medium Size Mills

Our "Star" Edger has been designed and built specially for mills of medium capacity where a first class edger is wanted, but where it would not be economical to put in one of our larger and heavier "Garland" Edgers.

The frame is all cast iron of heavy section, the mandrel is large and stiff. The Edger has a heavy press roll behind saws and the fingers in front prevent the lumber coming back. The feed rolls are corrugated and made of steel and are driven. In fact this edger is as well constructed throughout as the edgers of larger capacity. It is in no sense a portable edger, but is built for the most exacting requirements.

**Made in all sizes up to 40 inches**

*Send for Our Edger Catalogue*

# 440 Square Miles Timber Limits

on Georgian Bay

to be Sold by Private Sale in Large or Small Blocks.

On account of their President and Principal shareholders being engaged in other large enterprises, and not having the time to give to them all, THE PARRY SOUND LUMBER COMPANY, Limited, offer for Sale all of the timber lands, mills and town property situated in the Town of Parry Sound; also Tug Scow and full Camp Equipment for five camps, including boom chains, snow plows, sleighs, etc.

## THE LIMITS TO BE SOLD

comprise some 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, \$1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

 down the street is moving  
 his stock out quickly.

Handle a line of lumber that  
 sells well, prevents com-  
 plaints, is up to grade and  
 always satisfies your custo-  
 mers.

We aim to produce the high-  
 est quality of lumber at the  
 lowest possible cost. Our  
 workmen are skilled, are  
 under our personal super-  
 vision, and as a result, every  
 stick of lumber turned out is  
 strictly up to grade and pro-  
 duced at a minimum cost.

Dealers who handle our lumber  
 always come back for more.  
 Have you tried a car yet?  
 If not, get busy. Quick  
 shipments our specialty.

**DEFIANCE****Wood-Working Machines**

are worth their weight in gold

Price should not enter into the purchase of good tools. The prime factor is to secure the best that money will buy and that will give the best possible results at the least possible cost.

We have been making high grade wood-working machines for the leading manufacturers all over the world for over 60 years and they have always given the greatest satisfaction.

Our guarantee is "perfect machines and results that count."

Address Dept. M for full particulars and prices.

THE DEFIANCE MACHINE WORKS

- Defiance, Ohio, U.S.A.

28" Band Saw

**BETTER LUMBER**

When all has been said that can be said, every experienced lumberman will admit not only that the Wickes Gang makes the most perfectly manufactured lumber that comes from any kind of saws, but that it will saw lumber more cheaply than can be done by any other known means.

Foreign buyers always prefer gang-sawed lumber.

A Canadian customer is installing a gang because he can get 75 cts. per thousand more for gang-sawed deals. And he will not only win the 75 cts., but further profits because of cheaper sawing and by getting more lumber from the logs.

**Cheaper Sawing****WICKES BROS., Saginaw, Mich.**

Seattle Office, 410 White Bldg.

**YANKEE PATENT REMOVABLE SPLIT - RIM SPROCKET****SOMETHING NEW IN SPROCKETS**

The removable rim does away with removing Sprocket from Shaft. To renew, unbolt two halves of old rim, and replace with two new halves. You only buy the Rim, at one-third cost of new Wheel. Done in one-fifth the time compared with Standard Sprocket.

The **A. M. ELLICOTT CO., Montreal****Look Here****Mr. Millman**

You can get better results out of this little mill than any other on the market.

It can be made portable or stationary.

It reduces the Cost of Manufacturing.

It Increases your mill Output.

It Produces boards of Uniform Thickness.

It is Indestructible, Light and never in the Repair Shop.

## Power-Saving Rubber Belting

Goodyear Rubber Belting stands for power saved and money saved. It is built up of plies of rubberized fabric cured and vulcanized into one solid piece. It neither slips nor stretches. It has the cohesiveness of rubber with the enormous tensile strength of close woven, long fibre cotton fabric from which *all stretch has been taken out.*

Goodyear Rubber Belting is manufactured by a process that makes it proof against steam, water, weather and rot. Made in all three grades and all sizes. For Pulp, Paper, Saw Mills—all mills

where horse power transmitted is large and demand for tensile strength great. Used by biggest lumber mills and manufacturing plants in the Dominion. *Outlives, outlasts* all other belts.

## Rot-Proof Mill Fire Hose

*Goodyear Underwriters* is a hose built to meet the specifications of the Associated Factory Mutual Fire Insurance Companies. Tube used of highest grade NEW rubber. *Won't* harden or crack with age. Special circular woven fabric with least ex-

pansion or elongation under pressure. Antiseptically treated to make it rot and mildew proof.

The strongest most reliable hose for all mills and factories. Insist on *Goodyear Underwriters, the hose with the black and yellow stripes.*

## Non-Chipping Conveyor Belts

Built for all purposes. For conveying crushed stone, grain, coal, ore, etc.

Made in all thicknesses of face to suit requirements of buyer. Rubber face made of toughest stock possible, to prevent cutting and

chipping. Gives longest, most enduring service.

We also manufacture other rubber goods, such as tires, all kinds of hose and belting, rubber packing, etc.

Write us tonight for catalog and prices.

**In all of our business in Canada last year, we had to replace because of slight defects, only \$155.22 worth of goods.**

There is this, that you can count on, in all Simonds Canada Saw Company's Circular Saws, solid or inserted tooth, whatever the gauge, whatever the tooth, whatever the use—Uniformity.

Buy a Simonds Saw to-day and duplicate your order any time afterward, and you get the same temper, the same material, the same trueness, the same adjustment, the same finish, the same strength, the same cutting qualities, the same all around satisfaction, that you got in your first purchase, and that led you to call again for a Simonds Saw.

No time was too long, no effort too vast, no pains too great, for us to take in securing the Simonds Standard of Quality of Saw, and there is nothing on this globe that can hold us back from maintaining the uniformity of that standard.

We make every kind of Saw used in lumbering and mill work, and on woodworking machinery, Cross Cut, Band, Gang, and Solid and inserted Tooth Circulars.

*(To buy right—let your order read Simonds)*

## TERMS OF SUBSCRIPTION:

Canada, United States and Great Britain, \$2.00 per year in advance; other foreign countries embraced in the General Postal Union, \$3.00.  
Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

## Duty on Jointed Lumber Upheld

It is a long time since there has been so much discussion about lumber in the House of Commons at Ottawa as took place during the last month or two. With a return of a protectionist Government to power and the prospect of important alterations in the tariff, lumbermen naturally hoped for better treatment than they have received in the past. Some of them profess to believe that the present Government will place a duty on rough lumber entering Canada, equal to the duty which Canadian lumber pays when entering the United States. This may come to pass some day, but in the meantime it was reasonable that the lumberman of Canada should expect the existing tariff to be interpreted and enforced strictly according to the letter of the act. The tariff act permits rough lumber, dressed on one side only to enter free of duty. Lumber which is dressed on one side or one edge or, as the act says, "dressed on one or both sides, when the edges are jointed or tongued and grooved," comes under item 505 of the tariff, which makes it subject to a duty of 25 per cent., when imported from the United States. One would imagine that this was perfectly clear and simple and that the duty would be collected and paid without any question. Nevertheless on this very point, there developed recently one of the fiercest debates that the Parliament of Canada has ever witnessed on a plain matter of business.

Of late years the Government has allowed lumber to enter Canada free of duty, which is dressed on one side and of which the edge has been planed and then roughed over with the side of a saw, so as to take off the marks of the planer. To all appearances this is rough lumber, dressed on one side only, but it is lumber which can be used for building purposes without further manufacture in any way. The planing of the edge reduces the lumber to uniform thickness. It is lumber which has been "further manufactured than dressed on one side and it requires no further manufacturing in

Canada before being used in the construction of a building. Canadian woodworking or lumber manufacturing industries lose their protection, when this lumber is admitted free of duty and are deprived of the business which would result from completing the manufacture of this lumber, or producing other lumber to take its place. The tariff act very clearly was drawn up with the express intention of preventing such lumber from entering the country duty free. Yet in the face of this unmistakable intention of the framers of the act, it required debates extending over two whole days in the House of Commons at Ottawa to dispose of the subject sufficiently to allow the defeat of a vote of censure upon the present Government for deciding no longer to allow lumber to enter Canada free of duty, on which there is evidence of planing on the edge, as well as one fully dressed side. The proposition is a simple one to a lumberman's mind, but when politics enter a simple matter of this kind there is no foretelling how complicated the issue may be made to appear, before it has been completely threshed out. The political end of the present affair has to do with the alleged interests of the western farmer, that great factor in the upbuilding of Canada who has produced so much to its wealth and has secured such excellent treatment from the Canadian Government, ever since he has become an important element at election times. Fortunately in the debate which preceded the taking of a vote upon the second occasion on which the subject was debated in the House of Commons recently, the political aspect of the situation was made amply clear and its bona fides were demonstrated to a nicety.

Many side issues were brought up to cloud the main point and there was much eloquence released upon the alleged iniquities of the lumber trust, which was represented as squeezing the last penny from the needy settler and forcing him to live in a house through which the wind blew and the chilly blasts of winter entered to make his life miserable. He was even represented as living in a shack composed of the side of a hill with a roof and 3 walls built beside it. These word pictures of the poverty of the western farmer do not mate well with the glowing tales of prosperity which are told abroad by agents of the Government seeking to encourage immigration to Canada. The truth no doubt lies midway between. The farmer of the prairies, or the immigrant who is making a home for himself wants his lumber as cheap as he can get it. That is the key to the situation. Whether the lumber comes from the United States or from Canada is of no concern to him. He gets it as cheap from the one source as from the other. The difference in price, which allows the United States lumber to undersell the Canadian product, is taken up by the middleman before the lumber reaches the consumer. The actual purchaser of lumber on the prairies has little or no interest in the matter. He would probably be better off if the competition between the two sources of supply were on a more equal footing. He would then have a wider range of selection and would also secure the benefit caused by the desire of active competitors to furnish the best possible service in the way of quick delivery.

In the House of Commons, after the question had been shorn of its confusing side issues, the discussion settled down to a consideration of what constituted "jointing," as applied to the edges of a piece of lumber. The claim was made by those who were opposed to the collection of the duty, that lumber which had been planed and then roughed on the edge was not "jointed;" that if it had to be used for the finer purposes of cabinet making, etc., the edge had to be "further manufactured," before a perfect joint had been secured and that therefore there was no "joint." The Government established the fact however, that this lumber, with the edge planed and subsequently roughed, was used extensively in building operations, without further manufacture and that they were therefore entitled to collect the duty so long as there was any sign upon the edge of the lumber indicating that it had passed through a planer.

The whole situation was summed up, by the Minister of Customs at the conclusion of the debate, in words which to anyone familiar with the lumber industry are convincing. The Minister of Customs spoke as follows:—"The Board of Customs acted on their own judgment. Lumber that is planed on one side only certainly

comes in free. United States citizens without a doubt have used a small saw for the purpose of trying to defraud the customs revenue. If they succeed in obliterating the planing, and we cannot detect it, we have to allow it in as sawn lumber; but if it shows part of the original planing, it is evident to the customs officers that it was planed, and the Board of Customs claim that it should be

dutiable. So far as I am concerned I am only administering the law as passed by this parliament. I have no desire to impose a duty on the people of this country more than the law calls for. At the same time, I claim that in this case I have carried out what has been the custom of every government in this country for many past years."

## British Columbia Forestry Bill

The Honorable W. R. Ross, Minister of Lands for British Columbia, in presenting the second reading of the new bill for the creation of a Bureau of Forests and for the reorganization of the fire prevention, forest conservation and timber system of British Columbia spoke at considerable length upon the subject. Outside of the propositions of the bill, the most interesting announcement made by the minister was the fact that the government had engaged as consulting forester for British Columbia, Mr. Overton W. Price, who was in large measure responsible for the organization of the United States Forestry service, while Mr. Gifford Pinchot, the former chief of the United States Forestry service, will lend his friendly supervision and co-operation and will visit the province of British Columbia in this connection some time during the coming summer.

Honorable Mr. Ross referred at some length to the legislative history of forestry administration in British Columbia and claimed that the province had nothing to fear from comparisons of its forestry policy with those of other countries. In its main features, he claimed that the British Columbia forestry policy stood by itself as the soundest, most effective, most profitable and the most convenient method of obtaining a steady flow of revenue from the forest that had as yet been devolved by any country.

Referring more particularly to the forestry policy of the Government, the Honorable Mr. Ross asked what must be done to conserve the forests of British Columbia. They must in this new province face the same problems which had been faced by the United States a few years ago. The first essential was the creation of a thoroughly efficient forestry service.

The duty of the experts who would form the forestry service would be to ascertain exactly what timber existed within the province. There was reason to believe that the reserved timber was much greater than most people imagined. To facilitate this work licenses must all be surveyed as soon as possible and in any event before 1918.

According to requirements sales of crown stumpage on the existing reserve would be made. Every effort had been made, in the preparation of the forest bill, to put all holdings upon an equality. For this reason all future sales would be of licenses, conditions of each sale being regulated by the individual circumstances. There would be sales for immediate logging as in the case of burnt timber liable to spoil. There would also be sales on the basis of bonus per thousand feet in addition to royalty payable when the timber was cut, according to the method adopted in Ontario, which insured that the Government should be paid for everything standing upon the land, while at the same time benefitting the purchaser because the Government, to that extent assumed the fire risk. Pulpwood timber would be sold under license. A cruise and thorough examination of pulp concessions granted by previous governments would be undertaken. No change was to be made in the present rate of royalty. Reafforestation was to be provided for by the creation of forestry reserves, the essential preliminary to reafforestation being fire protection. A forest protection fund was to be collected, to which all holders of timber would be required to contribute on the basis of 1 cent per acre, the Government on its side providing an equal amount.

## Taxation on Timber Lands in B. C.

The B. C. Royal Commission on Taxation have just presented their report to the provincial legislature. In regard to timber land taxation they recommend a two per cent. tax upon assessed value.

Regarding timber land they say: "Timber land is defined in the 'Assessment Act' as 'all land owned, leased, held under licence, claimed, or occupied by any person for the special purpose of cutting or removing timber therefrom, or which is held as an investment for the accruing value of the timber growing thereon, and which is not held for any other purpose, and which averages at least 5,000 feet of merchantable timber to the acre.'

The evidence with regard to the timber-land tax was voluminous, but its range was chiefly concentrated on the question of values. The 2 per cent. on assessed value was generally supported, though those advocating the 'single tax' expressed a desire to tax timber land, as well as all other natural resources, more heavily than at present, so that they should bear the whole expense of the government of the province. No very definite complaint was adduced on the question of the royalty paid for timber (board measure).

"Lumber representatives were generally of opinion that all holders of timber leases and timber licenses ought to contribute towards the expenses of fire protection in proportion to the area of stumpage, and that there had not been much disposition shown by some owners of such lands hitherto to safeguard their timber limits against fires.

"Others advocated the appointment of a Fire Commission, as in Idaho, where large proprietors form part of the Commission, and establish patrols.

"Some witnesses commented strongly on the depletion of tim-

ber in the province through extravagant or careless felling and destruction by fire combined. It was pointed out in connection with this matter that, if the tax on timber land were lower, there would be less temptation to cut down timber so fast as is being done, the general practice being at present (according to these witnesses), on account of the higher rate, to fell the best timber, and then to give up the licence or lease.

"Others were in favor of a lower rate of licence and increased royalties, for the reason above given—viz., that the present rate tempts the logger to cut the best part of the timber and then surrender the lease or licence. Others held that the land should be taxed on stumpage basis and not on royalties. There were also statements to the effect that the \$140 licence fee on timber acreage in the coast districts and the \$115 fee in the interior districts were respectively too low and too high compared with the relative value of the timber in the two regions. Witnesses, however, were not altogether in accord on this point.

"Suggestions were also made that, for the prevention of waste of a valuable natural resource, permission ought to be granted to the owners of timber limits to export logs suitable for piles, poles, and posts, and railway ties. It was explained that in the process of cutting saw-logs much smaller timber, for which a market could be found abroad, was necessarily thrown down, and that, if operators were permitted to export these, the danger of destruction of forests by fire would be greatly diminished, employment would be given to more labor, and a substantial addition would be made to the revenue. The last-mentioned aspect of the case is the reason why the

Commissioners bring the subject under the attention of the government, but without making any recommendation, since the question of policy involved does not appear to lie within instructions.

"On the whole, the Commissioners are not prepared, after re-

viewing the evidence at their disposal, to suggest any modification in the existing legislation regarding timber lands and timber holdings, and refer the question of fire protection to the consideration of the government."

## Railway Commission Considering Forest Fire Prevention

As a result of the application of the province of British Columbia and recommendations of the Dominion Conservation Commission the railway commission will draft regulations to prevent further loss to Canada's forest wealth due to fires started by railways. This was announced by Judge Mabey at the conclusion of an important hearing of the whole matter recently. In giving it the chairman stated that, "these regulations will be drafted and submitted to the railway companies and others interested. If they are regarded as unfair, as too drastic or too weak or otherwise objectionable, we will hold another conference. It is not our desire that these regulations should be unreasonable. The loss to the country, however, from the burning of timber directly due to the operation of railways has been something awful and the question should have been taken up 25 years ago. We hope to be able to get some regulations which will prevent in future the devastation that has occurred in the past."

Mr. Clive Pringle, who appeared for the British Columbia government before the commission, stated that they wanted a general order covering the danger zones excluding, if it were thought wise, regions where oil burning locomotives were used. The regulations since the matter was first taken up, had been to a large part fulfilled by the railways which had co-operated in preventing fire. He instanced the great loss of life which occurred as the result of these forest fires as emphasizing the necessity for a general regulation.

Mr. Flinthoff, counsel for the C. P. R., told what his company did in the way of protection in its different sections through the forest belt. Men on "speeders" patrolled the line for fire but gasoline cars were not used.

"Have you any instructions in regard to the burning of oil in C. P. R. locomotives?" he was asked by the chairman. The reply was that on some parts of the line oil was being used, but the cost of

transportation inland from the coast was prohibitive.

The Great Northern Railway, however, it was brought out, employed oil on all trains from Seattle to Vancouver and never had any fires. In this connection Dr. B. E. Fernow, Dean of the Faculty of Forestry in the University of Toronto, stated that oil burners, if properly operated, were practically an absolute preventative against fire while spark resisters in locomotive flues were never absolutely reliable. He read a draft of the regulations which he has submitted to the railway commission for fire protection along railway lines. They provided that where oil burning locomotives were not used there should be patrols along the right-of-way, that locomotives should be fitted with ashpan screens and spark arresters and that all firefighting equipment should be inspected by the railway commission. A new and very important provision was that in cases where owners of adjacent wood lands allowed slash within 100 feet of railway tracks or otherwise encouraged fire, railway companies which gave them due notice of this condition would not be responsible for fire loss caused by them.

In connection with further evidence by the C. P. R., Judge Maybee stated that there was not a ranger along the whole north shore of Lake Superior. "Why not protect the young growth as well as the old?" said the chairman. "My experience has been that railway companies pay no attention whatever to the infants."

Secretary James White of the Conservation Commission read a letter from that body stating that Dr. Fernow had been asked to draw up, in co-operation with Judge Mabey, draft regulations for preventing fires caused by railroads and that he, with Hon. Clifford Sifton and Senator Edwards were also to co-operate generally in the attainment of this end. Judge Mabey then stated that regulations would be drawn up and submitted.

## Editorial Short Lengths for Busy Readers

Following on the recommendations of the conservation commission, the government has approved and will shortly carry into effect the setting aside of an appropriation of \$110,000 to be expended this year on the new Rocky Mountain forest reserve. The minister of the interior has also decided to appoint a forestry expert, a trained man, with a scientific and practical knowledge of the work, to take charge of the reserve. As the latter is a tract 600 miles long and anywhere from thirty to sixty miles wide, or about 30,000 square miles in all, a staff of some proportions will be needed, particularly for the preliminary work. The \$110,000 appropriation will be used in making trails, establishing stations, installing a telephone system, and endeavoring to prevent the possibility of fires in the huge reserve. The question as to whether the reserve should be made a game preserve as well has come up. It is likely that a part, but not the whole of the segregated section, will be set apart for the preservation of Canadian animal life.

The first report of the British Columbia Sanitary Inspector which has just been published refers to sanitation in the camps as follows:

"Judging from my limited experience during the past few months, it appears that the sanitary conditions in railroad, logging, mining, and other camps throughout the Province are not, upon the whole, satisfactory. I have found a number of cases where proper attention has not been paid to ventilation, disposal of garbage, etc., although in every case the person responsible for the camp has at once rectified the matter on my suggestion. In this connection, I

should like to state that in every instance I have met with nothing but kindness and courtesy from those responsible for the operation of the various camps.

"From the reports received from the outside camps, as well as my personal experience, I find that, with very few exceptions, the water-supply is first-rate, the water being plentiful and good. In a number of what may be called permanent camps there have usually been erected a number of cottages which have been built and occupied by the men themselves. These buildings are usually well built, complete, and fairly sanitary.

"The question of the ventilation of bunk-houses is a somewhat difficult one. The usual method is by leaving a space in the roof or gables, but during wet and stormy weather the ventilation of the smaller bunk-houses presents a serious problem. Clothes are frequently dried in the same room as that in which the men sleep, and unless the windows and doors are kept open, which is impossible in bad weather, the atmosphere becomes very close.

"The department proposes to enforce the rules and regulations in every respect. While it is not intended to bring about any necessary changes in such a manner that hardships will be entailed, yet the department believes that the health of the men is the first consideration. I propose to make it clearly understood that no wanton breach of the department rules and regulations will be permitted.

"I have now under consideration the question of formulating a regulation which will make it compulsory for all camps to keep on hand a complete first-aid equipment, with simple directions for its use."

# Fourth Annual Gathering of the C.L.A.

Enthusiastic Meeting of Representatives From Many Parts of Canada—Annual Fee Reduced One-half—Uniform Grading and Lumber Tariff Keenly Discussed

The fourth annual meeting of the Canadian Lumbermen's Association was held in the Board of Trade Building, Ottawa, on February 6th and was the most successful and interesting that the Association has ever held. There were about forty members in attendance representing Ontario, Quebec, Manitoba, Saskatchewan and British Columbia. In the absence of the president, Mr. J. B. Miller of Toronto, the chair was occupied by Mr. Alexander MacLaurin of the Charlemagne and Lac Oureau Lumber Company, Montreal. The attendance included the following: W. M. Ross, of J. R. Booth, Ottawa; R. G. Cameron, Cameron & Co., Ottawa; J. G. Cane, Toronto; W. B. MacLean, Conger Lumber Co., Toronto; J. C. Allan, Robert Cox & Co., Ottawa; J. C. Browne, Fraser & Co., Ottawa; Geo. Gordon, Cache Bay, Ont.; H. K. Egan, Hawkesbury Lumber Co., Ottawa; Walter C. Laidlaw, Laidlaw Lumber Co., Toronto; W. A. Firstbrook, Northern Timber Co., Toronto; W. J. MacBeth, Parry Sound Lumber Co., Toronto; W. Scott, Pigeon River Lumber Co., Port Arthur; P. C. Walker, Shepard & Morse, Ottawa; P. O'Leary, Strong Lumber Co., Orillia; A. E. Clarke, Edward Clarke & Sons, Toronto; J. G. Paynes, Campbell & Johnson, Toronto; Norman Wilson, W. C. Edwards & Co., Rockland, Ont.; Alex. MacLaurin, Montreal; T. J. Stevenson, and J. B. White, Riordon Paper Co., Montreal; Wm. Power, M.P., W. & J. Sharples, Que.; Arthur Campbell, Campbell & MacLaurin, Montreal; Maurice Welsh, Campbell & MacLaurin, Toronto; D. Murphy, Ottawa, representing Brunette Sawmill Co., Sapperton, B.C.; Otis Staples, Wycliffe, B.C.; H. Davidson, Hastings Shingle & Lumber Co., Vancouver, B.C.; A. Cotton, Vancouver, B.C., and W. A. Anstie, Secretary of the Mountain Lumber Manufacturers' Association, Calgary, Alta.

The address of the president which was read by the secretary was as follows:

## The President's Address

"In regard to the question of insurance we have received no complaints from our members and assume that there is now no difficulty in connection with placing any insurance with the mutual companies, reciprocals, or underwriters. Your particular attention is drawn to the necessity of making returns to the Government, on a form which is supplied by the Department of Insurance, not later than March 1st, for all insurance placed with outside companies, during the year ending December 31st.

"With regard to our freight rate case, the report, already referred to, to be handed in by the transportation committee, will give all information in this connection. I may merely say that export rates, which had been increased, into Montreal from certain territory, had, by order of the board, to be restored to the old rate.

"Perhaps the most important matter we have to lay before you at this meeting is the question of proposed changes in the customs tariff, on lumber imported into Canada. The tremendous increase noticeable in the imports of planks, boards, deals, joists and scantling, from the United States, is a matter which calls for the most serious consideration of our members."

The address then quoted at length, the remarks of Sir Edmund Walker at the annual meeting of the shareholders of the Canadian Bank of Commerce, upon the injury to the Canadian lumber industry resulting from the rapidly increasing imports of United States lumber into Canada. These remarks were published in full in the Canada Lumberman of February first.

Continuing, the President's address was as follows: "Since the publication of these figures, we have later returns, that is, for the eleven months ending November 30, 1911, and with each succeeding month, conditions seem to be getting more serious. For instance, for the period just mentioned, figures corresponding with the above, are as follows:

Year	Ft. B.M.	Value	Average Price per M. ft.
1909	127,104,000	\$ 3,512,158	\$27.63
1911	476,943,000	10,034,815	21.04

"It will be seen, therefore, that for every thousand feet imported in 1909, there was 3750 feet imported in 1911 and the average price dropped \$6.59 per thousand feet board measure.

"In connection with this matter, it has been stated in the public press, that the Government may possibly cancel what is known as the "Dumping Clause," at present on the Canadian Statutes, and it needs hardly to be pointed out that this would work to the further disadvantage of the lumber trade. In view of the above, a peculiar position of things exists. For the year ending March 31, 1911 (the latest returns available) the average

price on dutiable imports of lumber from United States, is only \$13.81, whereas during the same period, the average price on free imports of lumber from United States is \$18.10. Admitting that the quantity of expensive hardwoods imported may swell the average value of free imports to \$18.10, it must, I think, be conceded that \$13.81, f.o.b. at the mill, per thousand feet, as representing the value of finished lumber, that is planed or finished on more than one side, is ridiculously low, and this being the average value, it follows that there must have been a lot of lumber imported at less than this figure, and some, of course, at higher figures, but a difference of \$4.29 per thousand feet, between the average value of free imports and the average value of dutiable imports, is something which calls for further explanation.

"You will find in the report by the Executive Committee, a comparative statement of exports of lumber from the United States, as compared with those from Canada, to the various countries of the world, and in conjunction with that statement there is a suggestion that this Association should engage an expert lumberman and send him to the Central American States, the West Indies, and South America, for the purpose of making a full report thereon. In view of the near approach of the opening of the Panama Canal, this would seem to be a wise thing to do. Your attention is called to the fact that a representative of the Royal Mail Steam Packet Co., controlling 324 vessels, has very recently been investigating trade and harbor facilities of the North Pacific, with the view of entering into that trade.

The present annual foreign commerce of South American countries on the Pacific Ocean aggregates \$3,000,000,000. The Pacific coast Latin countries amounts to \$400,000,000 annually. New York, Philadelphia, Baltimore, New Orleans and other United States ports are all getting in line to be ready for the opening of this canal and undoubtedly there will be a serious dislocation of business. If large interchange in the lumber business takes place from the east to the west, the reverse condition of things will exist, and in the east we shall meet with western lumber at a less figure, owing to the water haul. When it is considered that the suggestion has been made that ships would use the Panama Canala free of cost, while foreign ships would pay a charge not exceeding \$1.25 a ton, it will be seen that our friends to the south intend to monopolize the benefits which this canal will bestow. The proposal to charge all United States vessels owned by a railway company, however, double the foreign rate, would be of no effect as this would participate of the nature of class legislation and would undoubtedly be fought to a finish in the United States courts.

"With reference to the annual shortage of cars, it is hoped that the orders recently placed for additional equipment by Canadian roads, will have the effect of doing away, to a certain extent, with this disability. The railways undoubtedly have done the best they could under the circumstances and we must all work together, that is shippers and carriers, for the general good.

"A proposition will be laid before you at this meeting, looking towards the reduction of the annual fee from \$50 to \$25. Your executive thought this was a wise thing to do at the present time. We have passed the experimental stage and I think it will be admitted that the existence of an association, such as this, can be of tremendous value to the trade, but without the hearty co-operation and assistance of every member of this association, in the strongest way possible, to take a live interest in its affairs and to communicate with the head office whenever any question comes up requiring expert advice and attention. The reduction of our fee to \$25 would mean that we must more than double our membership. We ought at least to have 250 members, but are now aiming to get 200. Let every member secure one additional application, and we shall accomplish our purpose. The Association is yours, and with your hearty and enthusiastic support, together with the increased numbers, which we expect, will accomplish still further for you in the future.

"It is with extreme regret that I refer at this time to the death of Mr. Peter Whelen. Those who had the pleasure of knowing Mr. Whelen, valued him highly as a friend and for his qualities of heart and mind."

## Report of the Secretary

The report of the Secretary was then read as follows:

"The agenda in your hands, shows the changes in membership which have taken place during the year, and in connection with this matter, your Secretary would urge upon each member of the Association to pledge himself to secure at least one new member. On previous occasions your Secretary has asked that a small committee on membership be appointed and he would again urge this upon your consideration. With a committee, of say three to handle this matter, there is no doubt in his mind that it would result to the great advantage of the Association. Particularly in view of the resolution which is to be submitted to you at this meeting, providing for the reduction of the annual fee from \$50 to \$25. We have seventeen new applications for membership in this Association, on the basis of the reduced fee to \$25.

"In connection with the proposed amendment of the customs tariff, since the President's address and the report of the executive committee were pre-

Alex. MacLaurin, Montreal,  
New President of C. L. A.

pared, it is reported in the press that the yardmaster of the Canadian Pacific Railway Company, at Regina, has been prosecuted, charged with allowing a car of lumber in bond, to pass through without payment of duties. Undoubtedly this is only one case of hundreds, and perhaps thousands, which have not been detected, or which have been allowed to go through. Closely allied with this question is the serious one as to the best means of meeting the "dumping" of lumber into Canada by United States manufacturers. This is an important proposition and one which calls for your most earnest thought, deliberation and action.

"With regard to the extension of the trade report branch of your Association, it would facilitate matters considerably if fuller information could be given your secretary, regarding the various parties under investigation. It is difficult to estimate justly what the standing of certain individuals is, from the meagre reports received in a number of cases, besides being unfair to the person or firm enquired about. The hope and effort on the part of your secretary is to give such information as will protect the seller and at the same time be fair to the buyer. The benefit must be mutual and your secretary suggests that it would be a good idea, when you return to your offices, for each member to report, voluntarily, to the office of the Association, any persons or firms who have been delinquent during the year just closed, or whose account has not been in satisfactory shape.

"All our members have been advised by circular, that they are entitled to an allowance of 500 pounds for variation in tare of cars and track scale allowance when shipped in box cars, all the year round, and 500 pounds in summer and 1,000 pounds in winter, when lumber is shipped on flat or gondola cars. In addition to this, on all lumber loaded on flat cars, shippers are entitled to an allowance of 500 pounds for the weight of stakes and fastenings, all the year round. These deductions should be clearly shown on the shipping documents and you are particularly urged to see that these allowances are made. If any member has difficulty in this regard, and will report to the secretary, the matter will be attended to promptly.

"We would also like full details from each member regarding the question of car shortage. Without specific instances, it is impossible for your Association to make effective protest. Individual effort in these matters is less effective than the concerted action of your Association."

The report of the treasurer showed a balance in the bank of \$534.

#### Executive Committee's Report

The report of the executive committee was as follows:

"This question has received the most careful consideration at the hands of your executive committee, and we wish to lay before you, in as concise form as possible, the exact position.

"According to the Canadian tariff, sawn lumber and lumber planed on one side comes into Canada free of duty; lumber further manufactured is subject to a duty of 25 per cent. ad valorem. On November 21st, 1911, a circular was sent to 354 sawmill proprietors and wholesale lumber dealers, asking the question, whether duties equivalent to those imposed by the United States on Canadian lumber should be included in the Canadian tariff. The reply requested was, "Yes" or "No," to the question, "Should such duties be imposed on softwoods?" and the reply "Yes" or "No" to the question, "Should such duties be imposed on hardwoods?" 144 firms replied "Yes" to both questions, 25 replied "Yes" to softwoods, and "No" to hardwoods, 2 replied "Yes" to softwoods and nothing to hardwoods, 16 replied "No" to both questions, and one replied "No" to softwoods and "Yes" to hardwoods. This makes a total of 188, out of which it will be seen 171 advocate an imposition of a duty of \$1.25 per 1,000 ft. B.M. on softwoods, 17 say "No" to this question, and 41 replies indicate that the writers do not wish such duties placed on hardwoods.

"There is no doubt whatever, that the privilege of bringing lumber into Canada planed on one side, free of duty, has led to very serious abuses on the part of some United States shippers, that is to say, that millions of feet of lumber further manufactured than planed on one side, have been brought into Canada in the past, free of duty. In support of this contention, particular attention is called to the annual report of the Department of Trade and Commerce, for the fiscal year ending March 31, 1911, as follows:

	M. Ft. B.M.	Value	Average price per M. Ft.
Dutiable Imports ...	22,848,000	\$ 315,756	\$13.81
Free Imports ...	193,177,000	3,496,496	\$18.10

This shows the average price per thousand feet on free imports was \$18.10, whereas the average price per thousand feet on dutiable imports, that is, lumber further manufactured, was only \$13.80, a difference of \$4.29 per thousand feet. These figures are for sawn boards, planks, deals, and other lumber. The above figures taken in conjunction with the tremendous increase in the quantity of lumber exported from the United States into Canada, comparing the period of eleven months, ending November 30th, 1911, with the same period in the year 1909, the quantity increased 349,839,000 feet B.M., whereas the average price decreased \$6.59 per thousand feet B.M., or over 23 per cent., shows the disabilities Canadian manufacturers are working under.

#### The Case for a Duty on Lumber

"In view of the reported intention of the government to withdraw the Dumping Act, it would seem as though the lumber trade must receive some sort of protection from the government, or the operations of the lumbermen will be very seriously curtailed, if not suspended altogether. The imposition of duties by Canada to correspond with the United States tariff, could not, of course, be construed as being an unfriendly act towards that nation. It has been the aim of your executive, to avoid even the appearance of irritation or annoyance, to our friends to the south, but we realize that the lumber industry of Canada has now reached that point, when some course must be adopted which will have a tendency to preserve the Canadian market for Canadian industries. It is an assured fact that the keen competition existing among Canadian lumbermen, with the utter absence of anything that can be construed in the nature of a trust or combine in the lumber business, having for its objects the fixing of prices or controlling the output in any way, guarantee that prices to the consumer would not increase. Particular attention is called to the fact that, notwithstanding the enormous increase

in imports from the United States, coupled with the tremendous decrease in price, as indicated above, the Canadian consumer has been paying for his lumber on the basis of the prices which Canadian manufacturers could afford to sell at,—the profits have gone to the middlemen, who, without any stake in the country, have been able to, thanks to the lax administration of the Canadian law, profit tremendously thereby.

"On the other hand, there have been indications that the United States Government would abolish their duty of \$1.25 per thousand feet B.M. on rough sawn lumber, and in this event, it would, of course, do away, to a large extent, with any argument for Canada putting a tariff on lumber.

"What effect the proposed formation of a tariff commission for Canada may have upon the lumber situation is another feature which must be taken into consideration. No doubt lumber interests will be given an opportunity of appearing before that commission, and it may be a wise thing not to agitate, at this time, for a change in the tariff, pending the appointment of that commission.

#### Interpretation of Tariff on Lumber

"Early in November, a deputation from British Columbia waited upon the Board of Customs in Ottawa, protesting against abuses by United States shippers, under the clause admitting lumber planed on one side, into Canada free. Your association was represented at that meeting and the result was the issuing of orders requiring strict observance of the Canadian law. The effect has been, that to a considerable extent, these abuses have ceased. If the importation of lumber planed or finished on one side were made dutiable, it would eliminate the danger of the continuance of these abuses, and the suggestion is made that probably at this time the best interests of the trade may be served by simply requesting that the words contained in item 504, of Schedule A, of the Customs Tariff of 1907, be amended by striking out the words, "dressed on one side only." This would interfere very slightly with the tariff and at the same time would give substantial relief to Canadian producers.

"Figures have been prepared by our secretary, on the basis of duties to correspond exactly with the United States tariff, excepting that sawn hardwoods should come in free in all tariffs. There is, also, an alternative proposition, putting on a duty of \$1.25 per thousand feet B.M., on sawn softwoods, sawn hardwoods to be free, with all lumber or timber, either hard or soft, when further manufactured, to be subject to a duty of 25 per cent., as at the present time. Provision has also been made for the imposition of duties on lath of 20 per cent. per thousand pieces, and on shingles of 50c. per thousand pieces.

#### Proposed Hemlock Association

"In October, your secretary was sent to Toronto to attend a meeting of the hemlock manufacturers and wholesalers. At that time the proposition was to form a Hemlock Association, having for its objects the uniform grading and inspection of hemlock. It was pointed out, that unless such rules were adopted and authorized by a substantial element of the trade, the objects sought would not materialize. It was suggested that the hemlock men, who were not members of this association, should join, lay their views before that body, and see if some remedy could not be found. A serious obstacle to a number of those present at that meeting was the fact that the annual fee for membership in the Canadian Lumbermen's Association was more than they felt justified in subscribing. Your executive then took up the question as to the advisability of reducing the annual fee, provided that a sufficient increase in membership would result, as would enable the necessary expenses to be defrayed.

"In the meantime the hemlock manufacturers have gone ahead with their uniform grading and inspection rules, and a copy of these rules has been forwarded to this association.

"We would suggest that a committee be formed to deal with this whole question of uniform grading and inspection. It should be stated at the outset that there is no intention on the part of this association to say to any manufacturer that he must grade his lumber in accordance with any set of adopted rules. Every manufacturer or dealer will continue to sell in the way that suits him, but in event of his selling to a new customer, or should there be the necessity to ship under uniform rules, such rules authorized by the Canadian Lumbermen's Association should be in existence.

#### Trade Report Branch

"On the 10th of August last, forms were sent out to all members, originating this branch of our work, and we feel that the experiment has demonstrated the useful service which this association can render to the trade.

#### Amendment to the Criminal Code

"As you are aware, at the last annual meeting, it was reported that representations had been made by this association, coupled with correspondence from the coast association, looking towards the amendment of the Criminal Code, which would protect lumbermen from log pirates in coastal waters.

"The adjournment of Parliament for Coronation proceedings, together with the subsequent elections and defeat of the Laurier Government, left the matter, September 21st, exactly where we were before negotiations had commenced. The secretary communicated with the secretary of the Coast Association, and when Parliament reopened, Mr. H. H. Stevens, Member of Parliament for Vancouver, was interviewed, and the final result is, that he has introduced a bill into the House of Commons, which it is expected will pass this session. Should this be the case, it will give a very substantial measure of relief to our Western members operating on the coast.

#### International Trade

"In the address of Sir Edmund Walker, President of the Canadian Bank of Commerce, at the annual meeting of that institution, January 9th, he drew attention to the tremendous difference which exists in Canadian imports and exports, and said, 'but the fact remains that we must enlarge the volume of products we have to export and either lessen our imports by curtailment of expenditure or by manufacturing at home many of the articles we buy abroad.'

#### Canada's Foreign Trade

"For a period of six months, ending September, 1911, the balance against Canada amounted to \$124,322,000.

"With a view of showing the countries to which the United States export lumber, your attention is called to the following statement:

	Exports from United States 10 mths. ended Oct. 31, 1911	Exports from Canada year ended Mch. 31, 1911
Boards, Planks, Deals, Joists and Scantling Exported to:—		
United Kingdom . . . . .	\$5,865,688	\$10,282,127
Belgium . . . . .	2,172,404	11,041
France . . . . .	604,343	30,677
Germany . . . . .	1,833,516	6,260
Italy . . . . .	863,898	.....
Netherlands . . . . .	2,054,022	3,400
Other Europe . . . . .	753,934	14,569
Cent. American States and Br. Honduras..	605,432	20,523
Mexico . . . . .	1,428,109	12,943
Cuba . . . . .	1,972,305	324,543
Other West Indies and Bermuda . . . . .	827,951	253,437
Argentina . . . . .	4,763,895	2,530,078
Brazil . . . . .	777,771	74,436
Other South America . . . . .	1,786,532	187,393
Chinese Empire . . . . .	494,261	27,807
British Oceania . . . . .	2,896,984	510,816
Philippine Islands . . . . .	172,695	.....
Africa . . . . .	544,774	290,439
Other Countries . . . . .	356,033	44,083
Newfoundland, Miquelon and St. Pierre..	.....	20,785
Alaska . . . . .	.....	665
Japan . . . . .	.....	30,477
	<hr/>	<hr/>
	\$30,774,547	\$14,676,499
Canada . . . . .	9,028,741	
United States . . . . .	.....	16,890,638
	<hr/>	<hr/>
	\$39,803,288	\$31,567,137

"For the ten months ending October 31st, 1911, not including Canada, the United States shipments of boards, planks, deals, joists and scantling, amounts to \$30,774,000, whereas Canada only exported to the same countries during the whole year, ending March 31st, 1911, excluding the United States, \$14,676,000."

#### Transportation Committee's Report

The report of the Transportation Committee was as follows:

"In our report of a year ago we stated that this matter had been disposed of in so far as rates on domestic shipments were concerned, and it was moved and seconded, a year ago, 'that this association respectfully ask the Board of Railway Commissioners to review orders No. 10528 and No. 12301, with judgment and memo attached to same, respectively, as far as the export rates are concerned.'

"On the 18th day of April, 1911, the Board issued order No. 13436, in which the railway companies were required to 'publish and file tariffs, to be made effective not later than May 1st, 1911, reducing the export rates on lumber, in carloads, to Montreal, for export, from points in the Province of Quebec east of the city of Montreal, and east of and including the line of the Canadian Pacific Railway Company's Laurentian Subdivision, between and including St. Lin Junction and Nominig, and east of and including the line of the Canadian Northern Quebec Railway Company's Montfort branch, between and including St. Jerome Junction and Huberdeau, so that the same differences shall exist between the present domestic rates on lumber to Montreal and the said rates on lumber to Montreal for export as existed between the old domestic rates and the old rates for export.

"And that the said order No. 12301, dated September 20th, 1910, be, and is hereby, rescinded."

"Inasmuch as there have been no complaints from any of our members shipping in that territory, we assume that the tariff is now satisfactory.

"This, therefore, disposes finally of the question. There is no doubt that the revenues of the railways have been tremendously increased as a result of the tariff complained of, being allowed to stand.

"In this connection, your attention is called to the fact that it was stated by the Rt. Hon. Mr. Borden, in the House of Commons on January 10th, 1912, that, owing to the fact that since the passage of the Railway Act in 1903, so many amendments had been made, the government had under consideration a revision and consolidation of the Act to embody all amendments. Your Committee urge, therefore, that this association join with the Canadian Manufacturers' Association, in formulating revised clauses, which, in our opinion, should be incorporated in the new Act. One recommendation we would strongly urge is, that freight operating expenses should be shown separately from other operating expenses. The earnings of each class are shown separately in the railway accounts, and it should be easily possible to apportion the operating expenses in like manner. Further amendments we would suggest were submitted at the annual meeting last year, and are here repeated:—

"Any special freight tariff of any transportation company, subject to its jurisdiction, which may hereafter be filed with the Board of Railway Commissioners, to which exception is taken by any person, company or other party interested, making formal protest, either before or after the effective date mentioned therein, against the adoption of said tariff, shall at the discretion of the Board be disallowed, until after such time as the Board shall determine, after hearing evidence produced for or against the adoption of such tariff. The Board may of its own volition without protest or complaint on the part of others, disallow any such tariff, or any portion thereof, with or without hearing evidence in support of, or against same.

"In any special tariff the rates contained in which are increased, the burden of the proof,

"(a) that old rates are inadequate, unsatisfactory, or unworkable,

"(b) that a larger freight revenue is requisite and necessary, and the reasons therefor, shall be on the transportation company or companies, or its or their representative or representatives, filing such tariff."

"For your information, we also append hereto the following resolution which had been passed by the executive committee of the Canadian Manufacturers' Association, and submitted to the Minister of Railways and Canals:

"Whereas, The Railway Act gives the Board of Railway Commissioners power to disallow any tariff or any portion thereof which it considers unjust or unreasonable or contrary to any provisions of the Act, and to prescribe in lieu thereof other tolls in lieu of the tolls disallowed only after the tariff complained of has actually come into effect;

"And whereas, The Act provides no satisfactory method of avoiding the burden of an increased tariff until proved by actual experience that it is unreasonable, the burden of such proof being with the public;

"And whereas, as no carrier is compelled to lower a tariff without a hearing, the public should not be compelled to suffer an increased burden without the same opportunity of being heard;

"Be it resolved, That the Minister of Railways and Canals be asked to amend the Railway Act so as to give authority to the Board of Railway Commissioners either upon complaint or upon its own motion to suspend the operation of any tariff or regulation for a sufficient time to permit of a full hearing, and afterwards to make such order as would be proper in a proceeding initiated after the tariff became effective; the burden of the proof to be on the carrier to show that the increased tariff or regulation is just or reasonable."

#### Car Stakes

"The Board of Railway Commissioners in their order No. 13326, March 27th, 1911, ordered that the weight allowance of 500 pounds per car be made on all flat or gondola cars, for weight of stakes and fastenings. All our members were circularized, advising this weight allowance, and your Committee hopes that every member is insisting on receiving these allowances from the railways. It should in all cases be deducted and shown on the face of the shipping receipt. Your committee recommend that their successors be authorized to ask for a further order from the Board, specifying how these stakes and fastenings are to be provided and at whose expense. This allowance for car stakes should result in saving many thousands of dollars a year for the shippers.

#### Track Scale Allowances

"This question was urged before the Board of Railway Commissioners, June 20th and 21st, 1911. On the 25th day of July, the Board of Railway Commissioners issued order No. 14389, wherein 'it is ordered that the special tariffs of the railway companies operating west of and including Port Arthur, Ontario, showing the allowances from track scale weights of carload traffic, as in effect immediately prior to the first day of May, 1911, be restored until the applicants and shippers shall have an opportunity of presenting their views to the Board, or until the matters in dispute shall have been adjusted between the parties at a conference which shall be had between the railway companies and shippers, or their representatives."

"On January 4th, 1912, a conference took place between the representatives of the railways and Messrs. Walsh, Tilston, and the secretary of this association, representing the shippers, in an endeavor to arrive at a solution of the difficulty. Mr. Kirkpatrick, Assistant Freight Traffic Manager of the Canadian Pacific Railway Company, advised that some of the western representatives intended to be here about the time of this meeting, and as a number of our western members are also here, your secretary suggested that February 7th, in Ottawa, would be a suitable and convenient occasion to meet and settle the question. We are strongly of the opinion that the track scale allowance should continue and if this can be made an order of the Board instead of a regulation of the railways, it will mean increased security for the shippers.

(This meeting will probably be held about February 15th).

#### Water Carriage of Goods Act

"On April 7th, 1911, a deputation from St. John, N.B., came to Ottawa, seeking amendments to the Water Carriage of Goods Act, claiming that the then existing conditions imposed serious burdens upon them. While shippers in this part of the country were not inconvenienced in any way, and notwithstanding the fact that lumbermen in the Maritime Provinces have persistently declined to join this association, it was deemed advisable not to oppose the New Brunswick and Nova Scotia shippers, as the proposed amendments did not interfere with shippers from the St. Lawrence or impose disabilities on members of this association. Our secretary attended all meetings of the House of Commons Committee, until section 10 of the Act was repealed and section 2, amended in accordance with the wishes of the eastern

#### Carload Minimums

"This matter has apparently been allowed by the railways to remain in abeyance, but it may come up at any time and your committee should have abundant evidence in connection therewith. Although this question was included in our original freight rate case, this feature of the matter was not dealt with by the Board of Railway Commissioners.

"Closely allied to this question is the one of average weights of lumber of various kinds, in various conditions, viz., green, partly seasoned, and seasoned. Considerable information has been tabulated by the secretary, but it would be exceedingly valuable to have full and authentic records from actual shipments made by Canadian millmen."

Added to the above report, is a special reference by your committee, reading as follows:—

"Your committee as a whole have had more or less evidence to show that the railway interests feel that the Canadian Lumbermen's Association is more or less of a dead issue, apparently due to the association not acting on our recommendation at last year's annual meeting, to the effect that a review of the orders issued should be asked by the Governor-General-in-Council.

"Under these circumstances we strongly recommend that more assistance and activity be adopted by the members as a whole, in assisting the transportation committee in handling these matters and that stronger support be given them than apparently has been given heretofore."

In connection with this report a discussion arose as to the necessity for inducing the railway companies to adhere to their schedules of estimated weights of cars in cases in which they cannot

show that they have weighed the cars. The matter was left to the executive committee.

#### Annual Fee Reduced to \$25

A motion was then presented by Mr. Walter C. Laidlaw, Toronto, that the annual fee of the association should be reduced from \$50 to \$25. The matter was discussed thoroughly and finally the motion was seconded by J. G. Cane, Toronto, and carried. The general consensus of opinion was that the association would be able to secure a much larger membership with the lower fee and that it would be able to render far more valuable assistance to the trade.

#### Uniform Grading Rules Proposed

Mr. W. J. MacBeth then presented a set of grading rules for white pine, red pine, spruce and lath which had been drawn up by several members of the trade and which he laid before the association with a view to having them discuss the matter and if thought desirable take some definite steps in the direction of adopting uniform grading rules. The matter was discussed at some length by the association and opinions were strongly expressed both in favor of such a step and in opposition to it. Finally a committee was appointed to consider the matter and report. The committee consists of the following: J. S. Gillies, Braeside, Ont.; F. N. Waldie, Toronto; W. C. Laidlaw, Toronto; P. C. Walker, Ottawa; A. H. Campbell, Montreal; and R. Kenny, Buckingham, P.Q.

#### Discussion Upon Proposed Grading Rules

An interesting discussion took place upon the subject of grading rules, introduced by Mr. MacBeth. The secretary explained that the matter had first been brought up in the executive committee, at a meeting which was held about three weeks previous, when the President, Mr. J. B. Miller, suggested that it should be discussed at the annual meeting.

W. A. Firstbrook, Toronto, remarked that grading systems were so different in the various parts of the country that in his opinion the matter of grading rules was one entirely of a local nature and it was therefore scarcely advisable that the Canada Lumber Association should handle it at all.

Mr. MacBeth replied that in such a state of affairs that there would be no central body which could lend its influence for the carrying out of the rules of any local institution. One man's opinion would then be as good as another's.

George Gordon, Cache Bay, Ont., said that if uniform grading rules were to be adopted and if the Canadian Lumbermen's Association was to continue as a national institution, they would be obliged to have an executive for each province, who would be charged with the handling of the local grading rules.

Gordon C. Edwards, Ottawa, did not think that there was any disposition to change their grading system, on the part of the Ottawa Valley manufacturers. It was a well known fact that they all made different grades in the Ottawa Valley, he supposed that what Mr. MacBeth was aiming at was the same system as was in force in Tonawanda; yet the Tonawanda grades varied even in the different yards. He was certainly strongly opposed to making any change in the grading.

Mr. MacBeth remarked that he was not in any sense the father of this idea. He had been asked by several lumbermen to block out certain grading rules and had done so. He had secured the opinion of several lumbermen who had gone through the rules with him in order to amend them. These rules were not drawn up with the intention of making any man sell his lumber strictly in accordance with them. He felt, however, that in order to conduct their business in an intelligent way, they must have some definite rules to use in the nature of a standard. Then whenever a dispute arose the Canadian Lumbermen's Association could have inspectors at different points who would be called in to adjust claims. The question would be taken out of the sellers' and buyers' hands, and whoever was in the wrong would have to pay the expense of the inspection.

Mr. Firstbrook remarked that he thought that it all came back to a local issue. It had been found impossible to make any grading in the Georgian Bay district that would apply to the Ottawa Valley district and the same would be found in regard to other districts. It would be necessary to have an organization for each district if different grading rules were to be adopted. For thirty years the Tonawanda trade had endeavored to do this same thing and yet they were not making uniform grades to-day.

Mr. A. E. Clarke, Toronto, remarked that as he understood it, Mr. MacBeth's proposal was not to set down any definite rules for selling, but to furnish an experienced inspector with a definite standard of grades, who would come between the parties in case of dispute.

Mr. J. G. Cane, Toronto, thought the rules of inspection would not be applicable to the Canadian Lumbermen's Association at all. The trouble arising was more between the wholesaler and the consumer than between the sawmillman and the wholesaler or consumer. The fact of the matter was that the consumer was supreme to-day and was telling the wholesaler just what he must do. If the consumer complained about a shipment, saying that it was of a certain grade, his word had to go. He thought that grading rules such as those proposed by Mr. MacBeth should be confined to Ontario. Some kind of arbitration of this nature ought to be adopted for settling disputes, but he did not think it would be possible at all for the Canadian Lumbermen's Association to take hold of the matter. The grading rules would not apply to the west nor would it apply to Quebec. Nevertheless, they wanted it badly in Ontario.

Mr. MacBeth said it might be well to have the grading rules localized, but at the same time they had no local association which could take up the work. If the Canadian Lumbermen's Association would not father the movement and give them some standard to go by, he could not see how it could be taken up at all. He believed that the Canadian Lumbermen's Association could fix it so that they would do away with all the trouble which they were now having in the carload trade.

This concluded the discussion during the morning and after lunch the matter was again taken up, when Mr. MacBeth read the proposed grading rules.

Mr. Gordon C. Edwards then proposed that the matter should be left

with the executive, to appoint a committee who would go into the matter and ascertain whether there was sufficient demand for a set of grading rules to warrant him in going into the question more fully.

Mr. MacBeth believed that this would be a good method to adopt.

The Secretary explained the course which had been followed by the hemlock manufacturers and wholesalers in Ontario, relating that he had been asked to visit them and had been requested to lay before the Canadian Lumbermen's Association the situation in which the hemlock men found themselves. The hemlock men found that they might make rules, but, having no organization, they could not enforce them. The question arose whether they could form an association at all which would be large enough and influential enough to enforce a set of grading rules. They had finally passed a resolution to refer the matter to the Canadian Lumbermen's Association, and subsequently they had gone ahead and drawn up a proposed set of rules, hoping that the Canada Lumbermen's Association would be able to act as a central body, so as to provide the necessary authority for the adoption of the rules.

Gordon C. Edwards suggested that a committee composed of three wholesalers and three manufacturers; two from the West, two from Ontario and two from Quebec, should be appointed to look into the matter. Mr. Arthur H. Campbell, Montreal, seconded this motion.

Mr. Walter C. Laidlaw, moved in amendment that the matter be laid on the table. Mr. W. B. MacLean, Toronto, seconded this motion. Mr. MacLean remarked that he and the Wm. Peter Estate, of Parry Sound, probably manufactured more hemlock lumber than any others on the Georgian Bay and they were both opposed to the movement.

Mr. Otis Staples, Wycliffe, B.C., spoke vigorously on the subject, saying that he did not think there was a single man in the room who, if he had once obtained uniform grading rules would not be strongly in favor of them afterwards and would wonder how he ever got along without them. The vote was taken on the question. The amendment to lay it on the table was defeated and the original motion was carried, the committee being appointed

The grading rules referred to were as follows.—

#### General Instructions

The aim of the uniform grading inspection is to harmonize the natural differences which exist in the characteristics of the different stocks, making lumber of the same grades at the different manufacturing points of practically equal value, whether the logs from which the lumber is cut are large or small, fine-knotted, black-knotted, red-knotted, sound or shaky.

1. No arbitrary rules for inspection of lumber can be maintained with satisfaction. The variations from any given rules are numerous, and suggested by practical common sense, so nothing more definite than the general features of different grades should be attempted by rules of inspection. The following, therefore, are submitted as the general characteristics of the different grades.

2. In the grading of finishing lumber in common practice, there is a recognized difference in classifying inch lumber and lumber thicker than inch.

3. A very large percentage of the 1¼-inch and thicker lumber used for finishing purposes goes into work requiring each face to be shown, as in doors, sash, etc. With inch lumber, except in shop, the uses are quite different, the almost invariable practice being that one face of the board is shown, and that face the better one.

4. The face of the lumber is the side showing the best quality or appearance.

5. Wane in lumber is a defect which cannot be described by rule with satisfaction, and, therefore, must be left to the judgment of the grader, but due consideration in rough stock should be given for the amount of wane that would be dressed off in milling.

6. Lumber must be accepted on grade in which it is shipped. Any subsequent changes in manufacture or mill-work will prohibit an inspection for the adjustment of claims, except with the consent of all parties interested.

7. All lumber must be well manufactured, and the length in Mill Run shall be 10 ft. and up (10 ft. lengths must not exceed 15 per cent.) including the odd feet unless otherwise specified.

8. What is known as Shorts shall be 6-9 ft. long, and will come under the same general rules in grading as 10 ft. and up. Owing to inspectors' differences of opinion it will be necessary to have an allowance of 7 per cent. to care for pieces called liners.

#### Standard Grades

The manufacturer is usually so situated that he is forced to put his lumber up in a general grade which is called Mill Run, which includes everything the log produces between a Mill Cull and a No. 3 Shop and Better. Mill Run and No. 3 Shop and Better are further subdivided as follows:

Uppers shall be 10 in. and over wide and free from all defects, and stand a little bright sap-wood, in the absence of bright sap a small pencil knot is permissible.

Selects shall be 8 in. and up wide. When 8-in. wide it may carry the same defects as a 10-in. Upper, and these defects increase according to width of piece.

Fine common shall be 8-in. and up wide. A piece 8 in. may have bright sap across back or slight sap stain, may also carry a few pin knots providing they do not go through the piece.

No. 1 shop shall be 6 in. and up wide, and 10-16 ft. long, and shall not cut less than 66-2/3 per cent. into No. 1 door stock, giving sufficient stiles to care for the rails and muntins in a standard 4-panel door. 50 per cent. of the remainder shall produce No. 1 sash cuttings.

No. 2 shop shall be 6 in. and up wide and 10-16 ft. long, and shall not cut less than 50 per cent. in No. 1 and 2 door stock, with enough stiles, No. 1 and 2 in quality to care for the rails and muntins, and must not produce less than 25 per cent. No. 1 door cuttings. At least 50 per cent. of the remainder shall make No. 1 and 2 sash cuttings.

No. 3 shop shall be 4 in. and up wide and 10-16 ft. long, and shall cut not less than 40 per cent. No. 2 and 3 door cuttings, with enough 2 and 3 stiles to care for the rails and muntins, and 50 per cent. of the balance to make No. 1 and 2 sash cuttings.

Good strips or No. 1 moulding shall be 4-7 in. wide and 10-16 ft. long, and shall be No. 1 shop and better in grade. Inspection from best face.

Good shorts shall be 4 in. and up wide and 6-9 ft. long, and shall be No. 1 shop and better in grade. Inspection from best face.

No. 2 moulding shall be 4 in. and up wide, 10-16 ft. long, and shall be No. 1 shop and better so far as knot defects are concerned, but may carry stain on both sides, and fine shake on one side. If stain is absent may have fine shake both sides. Inspection from best face.

No. 1 dressing shall be 4 in. wide, 10-16 ft. long, and may carry any number of knots providing they are sound and none are larger than 1 in. in diameter in 8 in. and wider and smaller in the narrow widths and square edged, will admit of small amount of bright sap. Inspection from best face.

No. 2 dressing shall be of the same general character as No. 1, except that it shall admit of fine tight shake on one side, bright sap no defect, may have some stain on back. Inspection from best face.

Common shall be sound and sound-knotted—will admit of black knots that are firmly set. Black knots shall not exceed  $1\frac{3}{4}$  in. diameter, and branch knots are also admissible if they are firmly set and not more than  $1\frac{3}{4}$  in. wide at widest point, and must not show on both faces. Stain is a defect in this grade, but will be admitted to the extent of not more than 10 per cent. of the pieces and the stain on the worst face. Some tight shake admitted.

Box shall be sound, admit of all knots that are too large for the grade of common, providing they are sound and firmly set. May admit of fine shake. Broom or loose shake not admitted in this grade.

No. 1 mill cull shall not contain more than 25 per cent. of hard red rot or more than 10 per cent. soft rot. Will carry an occasional worm hole, wane to the extent of half the thickness of the piece and not more than  $1\frac{1}{2}$  in. if on one face only, the other edge must be square. Shall be 6-16 ft. long and 4 in. and up wide. Inspection from worst face.

No. 2 cull shall contain all lumber below the grade of No. 1, excluding all lumber carrying 50 per cent. or over of soft rot, which shall be called Scoot. Inspection from worst face.

Dead cull is the lowest recognized grade, and admits of all defects known in lumber, providing the piece is strong enough to hold together when being handled in the usual way of handling lumber.

No. 1 barn shall be 4 in. and up wide, will admit of sound red knots  $1\frac{1}{4}$  in. in diameter, an occasional tight branch knot, must have one good edge, will admit of some shake and stain.

No. 3 barn shall be 4 in. and up wide, will admit of sound red knots  $1\frac{3}{4}$  in. in diameter, and smaller black knots, also branch knots, either red or black, if they are tight, considerable fine shake. 10 per cent. of the pieces may show stain on worst face.

#### Red or Norway Pine Grades

This stock is usually put up log run, which means the full product of the log with mill and dead culls out, although some mills put it up mill run. When this is the case, the clear and clear face is taken out of the log run, also the mill and dead culls.

Clear and clear face shall show one perfect face, bright sap. 10 ft. and up long.

Mill run shall contain all between clear and clear face and mill culls and shall be sound and free from all large black knots, also all heart checks that impair the strength of the piece. 25 per cent. of the pieces may show slight stain.

The grade of mill and dead culls in this will be the same as in white pine.

#### Spruce Grades

No. 1 shall be 4 in. and up wide, 10 ft. and up long, and carry the full product of the log, with No. 2 and dead culls out. The knots must be hard and firmly set in the timber, and shall not exceed 1 in. in diameter in 4, 5, and 6-in. stock. The maximum knot admitted in widths 8 in. and up shall not exceed  $1\frac{3}{4}$  in. in diameter. In the case of a branch knot it shall not be more than  $1\frac{3}{4}$  in. wide nor longer than  $\frac{1}{3}$  the width of the piece, and shall not show through the piece at any one point.

No. 2 will admit of large black knots, knots not sound in character, knot holes, heart checks and shakes that run parallel with the edge of the piece, black sap, firm red wood, wane or bark equal to half the thickness, but not more than 25 per cent. of the length or in more than 25 per cent. of the pieces. Pin holes are admissible, and grub holes if not too numerous.

Dead cull will carry red rot, dote, heart checks and all other defects common to spruce. Soft rot and other defects which render the piece worthless in character are not admitted.

#### Lath Grades

No. 1 white or red pine, hemlock and spruce lath shall be clear and of a uniform width and thickness generally. They must be butted to a uniform length of either 32 or 48 in.; may carry a small percentage of pieces that are stained.

No. 2 white or red pine, hemlock and spruce lath shall be of a uniform width and thickness generally. They shall be sound and may carry any number of knots that do not affect its use for plastering only. Shall be full length of either 32 or 48 in. exactly. Stains not a defect in this grade, unless very pronounced.

No. 3 white or red pine, hemlock and spruce lath shall be of such a character that it may be used for plastering on, may carry some rot, knots or knot holes, worm holes and wane, but must be of a uniform length of 32 or 48 in. exactly.

Mill run shall contain the run of the cut, with worthless stock out.

#### Election of Officers

The election of officers resulted in Mr. Alex. MacLaurin, Montreal, being chosen for president and the former secretary and treasurer, Messrs. Frank Hawkins and R. G. Cameron, Ottawa, being re-appointed.

The board of directors was elected unanimously as follows:—Quebec—A. MacLaurin, A. H. Campbell, Wm. Power, M.P., E. H. Lemay, Manitoba—D. C. Cameron, Saskatchewan—Wm. Cowan, Ontario—J. B. Miller, Gordon C. Edwards, D. L. White, Walter C. Laidlaw, J. J. McFadden, J. S. Gillies, J. G. Cane, J. L. Campbell, J. C. Browne, and W. A. Firstbrook. British Columbia—Otis Staples, W. McNeil, A. D. McRae, and John Hendry. Vice Presidents—J. S. Gillies, J. C. Browne, John Hendry and D. C. Cameron.

Executive committee:—A. MacLaurin, J. C. Browne, J. S. Gillies, Walter C. Laidlaw, Gordon C. Edwards, Wm. Ross, R. G. Cameron (Treasurer), and Frank Hawkins (Secretary).

# Thirteenth Annual Forestry Meeting

Important Progress Reported in Protection and Care of Timber Resources of the Country—Government Co-operation Increasing—John Hendry Elected President

John Hendry, Vancouver,  
New President C. F. A.

The Canadian Forestry Association opened its thirteenth annual convention at Ottawa on February 7th. The meetings were held in the Railway Committee room of the House of Commons and there were about three hundred in attendance. The chair was occupied by the President, Mr. George Y. Chown, Kingston, Ont. There was also upon the platform Right Honorable R. L. Borden, Premier of Canada, and Right Honorable Sir Wilfrid Laurier, both of whom made interesting addresses of welcome.

Rt. Hon. R. L. Borden called attention particularly to the partnership of the nation, not only the people of to-day but those of the future, in the possession of the natural resources of the country, and their duty

to ensure that the resources were developed and conserved in the most effective manner possible. In some countries which had reached a greater stage of development than Canada, the whole area of the country had been surveyed, and it was known precisely what each portion of the country was specially suited for. In Canada everyone knew that lands had often been used for settlement which would have been infinitely more valuable if the forests upon them had been preserved. It had been stated that more

of Canada's timber had been destroyed by fire than had been cut for lumber. Such a state of affairs called gravely into question the efficiency of our national methods. The wasteful methods of the lumbermen however, should also be kept in mind with a view to developing a more economic manner of operation.

Sir Wilfrid Laurier also welcomed and expressed his pleasure in being able to assure them of his hearty co-operation in the work which they were doing.

#### Address of the Chairman

The Chairman in his address reviewed the work of the year 1911. The work so far had fallen into three lines, conventions, lectures and literature, and these lines had been all followed in the year. The convention at Quebec January 18-20, 1911, which was convoked by Sir Wilfrid Laurier, and presided over by Senator Edwards, was one of the largest ever held in Canada. It followed immediately after the annual meeting of the Commission of Conservation and the members of that body assisted in the work. The lecture work and issuing of literature had been carried on vigorously.

During 1911 the Association lost by death a valued director and past president, Mr. E. G. Joly de Lotbiniere, of Quebec. Other leading members who died during the year were Messrs. Robert Meighen, of Montreal; David S. Cowles, of New York; R. E. Young, Dominion Geographer, and James E. Leamy, of New Westminster.

Considerable advances had been made in forest conservation in Canada in the year. The work of setting aside the forest reserve on the eastern slope of the Rocky Mountains had been completed, and the survey begun of the country through which the Hudson Bay Railway will run. Progress was noted in the various provinces. The work of the Canadian forestry schools grows in importance each year and a body of trained men was being built up.

Looking abroad satisfaction was expressed that the Weeks Bill passed the United States Congress, thus concluding a campaign of a quarter of a century to preserve the forests on the Appalachian Mountains.

The President made a vigorous plea for an aggressive policy. He held that the Association had aroused public opinion and must now bring that opinion to bear in securing a forward movement. The things for which the Association should work were (1) the taking of the forestry services, both

Dominion and Provincial, out of politics, making way for technically trained men; (2) a permanent forest policy, and especially a progressive policy with regard to the treatment of forest reserves; (3) some efficient manner of dealing with slash in order to guard against forest fires; (4) the employment of a trained forester by the Association.

#### Capital Necessary for Progressive Forestry

A paper entitled "A Progressive Forestry Policy Requires an Investment of Capital," which had been prepared by Mr. H. R. MacMillan, M.F., of the Forestry Branch of the Department of the Interior, was read by Mr. R. H. Campbell, in the absence of the writer.

The object of the paper was to show that forestry had really only begun when non-agricultural lands were set aside as forest reserves. After this beginning, in order to secure results, it is necessary to appropriate money and engage trained men to administer these reserves. That Canada has not done this already can only be explained by a lack of knowledge of the possibilities of timber production. For example, the Riding Mountain Forest Reserve in Manitoba contains 982,000 acres. If this were managed as are the average state forests of Germany (producing 58½ cubic feet of timber per acre per year) it would produce 57,000,000 cubic feet or 250,000,000 board feet of timber each year. This would mean that this one reserve would produce sufficient timber to supply in perpetuity the sawmills of Ottawa and Hull, and yet leave wood for thousands of settlers. Similarly, if properly handled, the forest reserve set apart last year on the eastern slope of the Rocky Mountains would produce yearly more timber than is manufactured in the two great timber provinces of British Columbia and Ontario. This reserve would supply one-half of Canada's timber trade, and be none the worse. It has been proven through centuries of forest management that the financial return per acre is in direct ratio to the amount spent in protection and management of the crop. This is exemplified by Prussia, which, in 1880, spent \$1.09 per acre in forest management and derived a net revenue of 92 cents; and which spent \$1.54 per acre in 1902 and reaped a net return of \$1.66 per acre. Canada should be encouraged in her investments in this field by the history of similar investments in Germany, France and British India. The expenditure per year per acre is: Prussia, \$1.90; France, 9 cents; British India, 6 cents. Canada does not yet spend one cent per acre on her forest reserves. When increased appropriations are asked there will naturally be a demand to know what they are for. The first need for expenditure is to make forests fireproof. The best way to fight fire is to prevent its getting started. Fires on reserves fall into three classes: 1, those started near railroads; 2, those started in clearing land, development work, logging operations, etc.; and 3, those started in the interior of the reserve by lightning, prospectors and sportsmen. Fires along railways will be prevented by patrol and good locomotive equipment, fires in settlement and development districts by requiring rangers to live in those districts. To secure efficiency, however, the reserves must be made accessible by trails, and rangers must be able to summon assistance in case of large fires by the use of the telephone. This means the cutting and making of trails and the erecting of telephone lines. These will aid in stopping fires in the interior of the reserves, and this equipment must be supplemented by lookout towers at suitable places, connected with the outside by the telephone system. The cutting regulations when the timber is sold must be such that the forest will not be left a fire trap, but in a condition that will provide for the natural seeding of valuable trees in the cut over land. Slash must be disposed of so as to remove fire hazard and favor the young growth. In order to pursue this successfully the governments must make a scientific study of the forests so as to say what methods should be followed in logging in each district. They must make experiments in the utilization of sawmill waste and other waste, in the possible extension of the pulp industry, and in fact do everything to make the forests more productive and forest products more valuable. Throughout it all this fact must not be overlooked, that money intelligently put into forestry is not spent but is invested for future revenue.

An interesting discussion followed the paper, in which the following took part: Rev. Dr. Geo. Bryce, Winnipeg; Venerable Archdeacon R. J. Renison, Moose Factory; E. Stewart, former Superintendent of Forestry for Canada; Wm. Ogilvie, D.L.S.; Aubrey White, Deputy Minister of Lands, Forests and Mines for Ontario; Lieut.-Col. J. W. Harkom, Melbourne, Que.; A. Knechtel, Inspector of Dominion Forest Reserves; and W. H. Berry, Superintendent of Government Scalers, St. Stephen, N.B.

#### Forest Fire Legislation

At the afternoon session Dr. B. E. Fernow read the report of the Committee on Forest Fire Legislation. The report stated that the committee had collected all the existing forest fire legislation in Canada and most of the United States. They had also received expressions of opinion from competent persons and upon these they based their report. They find that while the Dominion and all the Provincial Governments had passed legislation to protect forests from fire, these laws varied greatly in detail and in efficiency. They reviewed the laws of all the provinces, and taking all things into consideration stated that the law of Nova Scotia is probably the most efficient for the conditions there. New Brunswick, Quebec and Ontario have laws which are good in many respects, but they were all primarily designed to protect unorganized territory and they need to be supplemented by provisions looking to the co-operation of county and township authorities in the organized districts with the officers of the province and the rangers of the lumbermen in the unorganized districts. The laws of the prairie provinces were designed in the first place to stop prairie fires and need to be very considerably supplemented. In British Columbia and the Dominion fire protection is largely a matter of executive administration.

The committee reports that legislation to be effective must be carried out by a thorough organization backed up by public opinion. Different sections require different laws and the reason the Nova Scotia system is efficient is because all parts of the province are organized territory. Preventive measures are needful, and public opinion must be so aroused that persons guilty of causing fires may be properly punished.

The three main causes of forest fires are railroads, settlers and persons, like sportsmen and prospectors, passing through the forest. Regarding railroads, safety there should be sought in improved equipment of locomotives, clearing of the right of way and patrol. In regard to settlers the first suggestion is an educative campaign. Quebec is congratulated in that the clergy under the direction of the bishops read letters of caution from their pulpits. Times should be fixed in which settlers must burn the slash from their clearing operations and in each case a permit to burn the same should be secured

from the fire warden of the district. Regarding those whose business takes them into the woods, it is suggested that persons like tourists and prospectors passing through the woods should not be allowed to start fires for any purpose without having a permit from the proper officer. Such permits should be for a short time only and renewable upon good conduct. To reduce the danger from lumbering operations the report recommends the burning of the slash, while the logging operations are going on, or the "downing" of tops and branches so that they may lie close to the ground and rapidly decay. Upon the important question of organization the committee report that it should be central and permanent, and should at the same time co-operate with municipalities and timber limit holders. The organization should have an experienced head with large discretionary powers, and a body of permanent paid rangers. During the danger season this body should be assisted by additional patrol men. The country should be divided into inspectorial districts and each officer and patrol man must be held responsible for his unit. The equipment of districts at proper points with lookout stations, trails and telephone lines is recommended.

After the reading of the paper, it was made the subject of an interesting discussion in which the following took part:—E. H. Hall, secretary of the Association for the Protection of the Adirondacks; E. B. Rochester, Hull, Que.; Ellwood Wilson, Forest Engineer of the Laurentide Paper Company, Shawinigan Falls, Que.; N. S. Dunlop, claims agent for the Canadian Pacific Railway, Montreal; Prof. J. M. Macoun, of the Geological Survey, Ottawa; Hon. Sydney Fisher; Hon. W. A. Charlton, Toronto; Dr. B. E. Fernow; C. R. Pettis, State Forester of the State of New York; Gifford Pinchot, President of the American Conservation Association; W. M. Power, M.P., and Dr. J. T. Rothrock, Secretary of the Pennsylvania Forestry Commission.

#### Address by Gifford Pinchot

The most important event of the Thursday morning session was an address by Mr. Gifford Pinchot, president of the United States Conservation Commission, whose subject was "The Groundwork of a Forest Service." The first principles upon which any forest service must be based was absolute freedom from political control of the men. The Canadian service was to be congratulated upon the announcement made by Rt. Hon. R. L. Borden that this was to be one of its features. The second essential of the forest service was that the men must all be trained men. The third essential was that the service must have sufficient money for its work. Another important feature of the situation was the fact that the control of natural resources ought to be entirely in the hands of the federal government.

Mr. Pinchot then dwelt at some length upon the necessity for fixing definitely the line of responsibility for every man in the service and for placing upon every man a load of responsibility which would make him feel the importance of his work. He emphasized also the necessity for having the office staff back up the men in the field. This, above all other things, was of paramount importance and by developing the service along these lines the United States service had been able to build up a staff which was noted for its efficiency and which consisted to a remarkable extent of men who felt that the success of the service depended greatly upon their own fidelity to the principles upon which it had been developed.

Mr. Gifford Pinchot congratulated the Association on the results which it had achieved. The centre of the fire question, he stated, was getting men to the scene of a fire as soon as possible after it had been discovered. Another thing, upon which he felt as strongly as upon anything else in connection with forestry, was the fact that it was wholly impossible to have an efficient service so long as men were appointed to the work for political reasons. Just so long as men were chosen without some sort of preliminary examination would they have, not only less efficient men, but men who felt that their tenure of office depended upon something else besides their own good work. Speaking of the disposal of debris Mr. Pinchot said that each situation had to be treated upon its own basis. There were places where burning the tops was thoroughly practical and the best thing to do. There were also places where it could not be done. As to the lopping of tops in spruce timber they had demonstrated in the United States that by this method the fire danger was eliminated in seven years. In the logging of coniferous timber it was absolutely essential to dispose of the tops in one way or another and in his opinion it would be recognized soon that this was also necessary in the case of hardwoods.

A brief discussion followed Mr. Pinchot's address, in which Hon. Martin Burrell, Minister of Agriculture, and Mr. R. H. Campbell, Superintendent of Forestry, took part.

#### Attitude of the Railroads Towards Forest Fires

An address was then delivered by Mr. A. E. Sterling, Forester of the Pennsylvania Railroad, upon "The Attitude of the Railroads towards Forest Fires." Practically all accomplishments in forestry in the United States, he said, have taken place in ten years and the most important within the last five years. Our forests are still far from safe, but governments and individuals are now active, and another ten years should remove the fire menace. There are various reasons why railroads have been too frequently the cause of forest fires. No spark arrester has yet been designed which will check all sparks and yet give the locomotive free draft. Logically all inflammable material should be removed from the right of way, but this is very difficult, especially in new railroads through forests.

The right of way is too narrow for a safe fire belt even if cleared to mineral soil. There is no reason for the belief that railways deliberately permit fires to start. They are the heaviest losers when forests burn. They lose freight, tourist travel, and are besiged with damage claims. Under the impetus of the conservation movement in the United States, the federal and state governments, the timber owners and railways are now co-operating to reduce this loss. The most effective methods are the removal of debris from the right of way, regular patrol, systematic reporting of fires by train crews, trackmen, etc., the use of oil-burning locomotives, the keeping of ash pans and spark arresters in good condition. The clearing of land adjacent to the right of way with a fire guard on each side 200 feet from the tracks has been very successful. During 1911 only one fire was reported as having been caused by the Pennsylvania Railroad Company, and this was found to have occurred beyond the range of sparks.

At the Thursday session an interesting paper was read by Mr. E. Stewart, F.E., on "The Aims and Objects of the Canadian Forestry Association," after which several members took part in an informal discussion.

#### Appointment of Officers

The appointment of officers resulted in the following being chosen for the present year:

Hon. Past President, Rt. Hon. Sir Wilfrid Laurier; Hon. President, Rt. Hon. R. L. Borden; President, John Hendry, Vancouver; Vice-president, Hon. W. A. Charlton, M.P. The two vacancies on the Board of Directors, caused by the election of the Rt. Hon. R. L. Borden as Hon. President, and by the death of Mr. E. G. Joly de Lotbiniere, were filled by the appointment of Senator Bostock and W. C. J. Hall. Mr. A. S. Goodeve, M.P., was added to the Board of Directors as a representative of the province of British Columbia. Territorial vice-presidents were selected as follows: Ontario, Hon. W. H. Hearst; Quebec, Hon. Jules Allard; New Brunswick, Hon. J. K. Fleming; Nova Scotia, Hon. G. H. Murray; P. E. I., Hon. J. A. Mathieson; Manitoba, Hon. R. P. Roblin; Saskatchewan, Hon. A. E. Brown, Lieut. Governor; Alberta, Hon. A. L. Sifton; B. C., Hon. W. R. Ross; Yukon, Commissioner Black; MacKenzie, F. D. Wilson; Keewatin, D. C. Cameron, Lieut.-Governor; Ungava, Mgr. Bruchesi; J. S. Dennis, Calgary.

The following executive committee was appointed: The President, Vice-president, Hon. Sydney Fisher, Rt. Hon. R. L. Borden, Gordon C. Edwards, R. H. Campbell, Geo. Y. Chown and Dr. B. E. Fernow.

Mr. H. A. Reynolds secretary of the Massachusetts State Forestry Association, addressed the meeting briefly, conveying the greetings of the Massachusetts association and outlining some of the difficulties which the association had met with in fighting the natural enemies of the forests of the state.

#### Resolutions Adopted

A number of resolutions were passed by the Association, including the following:

The Association urged on the federal and provincial governments the necessity for providing a system of examinations to test the qualifications of appointees to the forestry service and of making appointments permanent during good behaviour, and that in the case of the federal government, appointments for this purpose should be placed in the hands of the Civil Service Commission.

That, in view of the fact that the expenditure on forest management in Canada is less than one cent. per acre of the forest lands, while the average in other countries ranges from two cents per acre to \$1.90 per acre, the federal government and the governments of the provinces should provide larger appropriations to assure efficiency of management and increasing profit from the forests of Canada.

That the Association should impress upon the government the necessity of maintaining, in connection with the Forestry Branch, an experimental laboratory for testing and investigating the physical and mechanical properties of Canadian woods, with a view to extending the possibilities of their use and for other purposes.

That the Association deprecated the practice of exporting in large quantities, Christmas trees of spruce and balsam and recommend legislation to prevent this practice.

The Association reaffirmed its attitude in favor of the inspection of the public domain and the inclusion in forest reserves of lands unsuited for agriculture, or where the forests are required for the protection of watersheds and urged on the federal and provincial governments the carrying out of such a policy at the earliest date.

A resolution was passed expressing deep regret at the death during the year of Mr. E. G. Joly de Lotbiniere, a past president of the Association.

The thanks of the Association were tendered to Mr. Jas. Lawlor, the energetic secretary to whom the phenomenal increase in mem-

bership and success of the Association are largely attributable. It is stated that Mr. Lawlor had more than paid his own salary through the fees of the increased members of the Association.

#### Foresters' and Lumbermen's Banquet

On Wednesday evening, February 7th, the Canadian Forestry Association held its annual banquet in the House of Commons restaurant. The Canadian Lumbermen's Association, which has always held a banquet of its own in former years, as the two conventions did not then occur at the same time and place, joined with the Forestry association on this occasion and the result was a most enjoyable banquet. The attendance numbered two hundred and there were among those present many of the most prominent foresters and lumbermen of Canada and the United States. The chair was occupied by Mr. Geo. Y. Chown, Kingston, Ont., president of the Canadian Forestry Association and upon his right and left were seated Rt. Hon. R. L. Borden and Rt. Hon. Sir Wilfrid Laurier respectively. The toasts, their proposers and those who replied to them were as follows: The King; The Parliament of Canada, by Hon. Sydney Fisher, replies by Rt. Hon. R. L. Borden and Rt. Hon. Sir Wilfrid Laurier; Our Guests, by H. M. Price, reply by Mr. Gifford Pinchot; The Lumbermen, by Hon. Geo. E. Foster, replies by Alex. MacLaurin and W. McNeill; The Forest Service, by Dr. B. E. Fernow, replies by R. H. Campbell and Aubrey White; Allied Interests, by Sir Frederick Borden, replies by N. Curry and N. S. Dunlop, representing the manufacturing and railroad interests respectively.

Mr. Gifford Pinchot in his reply to the toast to "Our Guests" delivered a most interesting address, in which he dwelt most particularly upon the necessity for eliminating politics from the forest service and for thwarting the monopolies which sought to acquire and control the great natural resources of the country. He pointed out clearly the manner in which the forestry movement had supplied the line of action which had been adopted by the whole conservation movement in the preservation of all the natural resources of the country.

#### Good Demand Expected From Railways

The Railway Age Gazette, noting that the slowness and uncertainty of trade were reflected last year in the records of railway car and locomotive construction, also feels justified in predicting that the present year, 1912, will show a favorable record, both for equipment built and equipment ordered. Many manufacturers, who have done less than half the business this year that they did in 1910, have on hand unfilled orders over twice as large as those on their books at the close of 1910. It is noted also that of the freight cars, approximately two-thirds were of all steel construction, or had steel underframes, and of the passenger cars, 2,930, a slightly higher proportion, were of all steel construction, or had steel underframes. Returns from locomotive builders in the United States and Canada show that 3,530 were built during the year, of which 3,143 were for domestic service, and 387 for export. Two hundred and twenty-five were compound and 133 were electric locomotives, a large part of which have been used for industrial switching service and similar uses.

#### Canadian Wood Pulp in England

Manchester is one of the chief ports in the United Kingdom for the importation of wood pulp, and large quantities are continually arriving from the Baltic ports, Canada and Newfoundland. For the past few months prices have been much firmer in all lines of wood pulp. The strengthening of the market is due in a great measure to the reduced output of the Norwegian mills, which shows a decrease in the output of mechanical pulp of some 30,000 tons per month, and that of chemical pulp of about 20,000 tons per month. This reduction is due to a lockout in the mechanical mills and the voluntary reduction by the Wood Pulp Association.

#### Lancashire Demand for Maple Flooring Boards

There is a continued and largely increasing demand all through Lancashire for maple flooring boards which are appreciated all through the North of England as an ideal flooring. Almost any width from 1¼ inch up can be disposed of in the Manchester market, and two responsible firms whose names are on file at the Department of Trade and Commerce, Ottawa, are open for unlimited quantities.

H. Elderkin & Co., Port Greville, N.S., report that in their opinion there will not be as large a cut of logs in Nova Scotia this winter as last, as a result of the drop in English demand and the depression in the United States markets. The weather this year up to the end of January had been very favorable indeed for logging operations.

# Pulpwood Production Shows Decrease

Value of Output However Advanced Owing to Better Prices—Exports of Wood Pulp Greater — Much Raw Material Still Going Abroad

Compiled by H. R. MacMillan, M. F.

Statistics of the production and consumption of pulpwood in Canada have just been published, for the year 1910, by the Forestry Branch of the Department of the Interior. The figures which follow refer only to wood manufactured in Canadian mills.

The fifty-one mills reporting used, in 1910, 598,487 cords of wood. There were exported in a raw state 943,141 cords, and for the first time pulpwood was imported into Canada to the extent of \$49,322.

Over 95 per cent. of Canadian mills cut the pulpwood used by them from their own limits, and consequently cross the wood themselves.

In Table 1 is shown the quantity, total value and average value per cord of pulpwood used and the number of tons of pulp produced in each province for the years 1909 and 1910, also the number of mills operating in 1910.

Pulpwood, 1909 and 1910, by Provinces; Total Quantity of Wood Used, Total Value. Average Value per Cord, Quantity of Pulp Produced and Number of Firms Reporting, 1910.

Province.	1909.				1910.				Number of firms reporting.

Approximate.

Table 1.

Although 23,642 cords of wood, or 3.8 per cent., less was used in 1910 than the year previous, the average price per cord has increased the value of the pulpwood industry by \$121,074 over its value in 1909. The decrease in the quantity is due to the temporary closing of one or two large mills. This year the price of pulpwood recovered from the decline seen in 1909, when the price was only \$5.57 per cord, and is about the same as in the year previous. The price was \$6.07 in 1908 and in 1910 was \$6. In 1910, also, 29,196 tons of pulp were produced than during 1909, owing to an increase this year of some 145 lbs. in the amount of pulp produced per cord of wood.

Quebec is the premier pulpwood province of Canada because of its extensive spruce and balsam fir forests suitable for pulpwood, abundant and cheap water-power and plentiful supply of labor. The twenty-five mills in Quebec reported the consumption of 57 per cent. of the total for Canada, or 22,820 cords more than in 1909. Ontario likewise increased the amount consumed in its fifteen pulp mills by 23,200 cords, and used over one third of the total consumption. The two provinces just named furnished over 92 per cent. of the total quantity of pulp. Nova Scotia consumed nearly 20 per cent. more than last year, while New Brunswick used barely one-fifth as much as in 1909. Thus Nova Scotia surpasses New Brunswick as a pulpwood province. New Brunswick in 1909 contributed 14.2 per cent. of the total; this year it was only 2.2 per cent.; this resulted mainly from the closing of one large plant. The province of British Columbia is still experimenting in pulpwood manufacture, and the negligible amount used in this province is for test purposes only.

PULPWOOD CONSUMPTION, BY PROVINCES 1910					
PROVINCES	HUNDRED THOUSANDS OF CORDS				
QUEBEC	22.8	23.0	24.0	25.0	26.0
ONTARIO	18.7	19.0	20.0	21.0	22.0
NOVA SCOTIA	2.5	2.6	2.7	2.8	2.9
NEW BRUNSWICK	0.9	1.0	1.1	1.2	1.3
BRITISH COLUMBIA	0.1	0.2	0.3	0.4	0.5

Diagram 1.

Quebec is the one province in which the price of pulpwood was less in 1910 than in 1909, the price falling off 35 cents per cord. The increase in the price of pulpwood throughout Canada is largely due to Ontario, in which province pulpwood was worth \$7.02 per cord, or \$1.30 more than during the previous year. Pulpwood from Nova Scotia, at \$4.59 per cord, was cheaper than in any other province.

The quantity, value and per cent. distribution of the species used for pulpwood in 1910 is given in Table 2.

Pulpwood, 1909 and 1910, by Species: Total Quantity, Total Value and Per Cent. Distribution.

Kind of Wood.	1909.			1910.		
	Quantity.	Value.	Per Cent Distribution	Quantity.	Value.	Per Cent Distribution
	Cords.	\$		Cords.	\$	
Total (1).....	622,129	3,464,080	100	598,487	3,585,154	100
Spruce.....	516,030	2,793,318	82.9	470,230	2,866,678	78.6
Balsam.....	100,095	637,065	16.1	120,475	698,608	20.1
Hemlock.....	700	3,156	0.1	3,810	16,922	0.6
Poplar.....	5,188	30,135	0.9	3,608	21,366	0.6

(1) The total contains a small quantity of wood not identified by species.

Table 2.

The decrease in the amount of pulpwood used in 1910 chiefly affected the use of spruce—45,800 cords less of this species being used in 1910 than in 1909. Although still over 75 per cent. of the total pulpwood consumption, the proportion is gradually becoming less. In 1908 spruce formed 87 per cent. of the total, in 1909, 83 per cent., and in 1910 78.6 per cent. The loss is all seen in New Brunswick, in which province 71,000 cords less of spruce was used this year than in 1909.

Diagram 2.

Balsam fir is a species of wood which is increasing in importance as a pulpwood. In 1910 twenty per cent., or 20,380 cords, more balsam fir was used than in 1909, and it is steadily gaining for itself a higher position among the important pulpwood species. In 1908 it formed 12 per cent. of the total, in 1909, 16 per cent., and in 1910, 20 per cent.

Another species which is gradually but surely becoming more important is hemlock, over five times as much being used in 1910 as during 1909. Hemlock was reported as a pulpwood for the first time in 1909, and this year it was used to a greater extent than poplar, thus becoming the third species in importance among pulpwoods.

The use of poplar fell off one quarter, as only 3,608 cords of this wood were used in 1910. Jack pine has not been reported as a pulpwood since 1908. Before that time it was used considerably by two large mills, but has proven unsatisfactory.

The average price of the different species used is the cost to the mill-owner, and so includes varying logging expenses and a wide difference in transportation charges. A considerable proportion of pulp-mill owners have their own timber limits, and to them the cost of pulp logs is merely the cost of carrying the limit and the transportation charges. Other operators buy in the open market and add transportation charges also.

Thus the prices quoted are the purchase price under different conditions and do not show the relative value of the different woods for pulp manufacture.

The effect of an excessive hauling distance is demonstrated in Ontario, where the price of spruce and balsam fir in 1910 was \$7.01 and \$7.22 respectively. The high price of balsam fir and the increased demand for this species proves its suitability for manufacture into pulpwood. Spruce was the most expensive species at \$6.05, or 64 cents more than in 1909. During 1910 the price of balsam fir fell to the amount of 55 cents, to \$5.71. Hemlock remained at about the same price for the two years and is still the cheapest species. In 1909 it was \$4.51, and in 1910 \$4.43. Poplar has increased 11 cents during the year, the price being \$5.92 during 1910. The cheapest pulpwood bought was a small quantity of poplar in Nova Scotia, which cost \$3 per cord. Balsam fir in Ontario at \$7.22 was the most expensive wood used in Canada for pulping.

During 1910, no slabs or sawmill waste was reported as being converted into wood-pulp. This is an economy practiced in other countries, and by neglecting it Canada is losing greatly. It has been conservatively estimated that if all useful logs left in the bush by lumbermen, large-sized branches, slabs and other mill waste from the lumber industry in Canada had been conserved and converted into pulpwood in 1910, the annual output of pulp-

wood would have been increased, and not a single acre need have been cut over for logs to make wood-pulp only. During 1909, in the United States, 6 per cent. of the total pulpwood consumption was from slabs and mill waste. If economy had been practiced to the same extent in Canada during the year 1910, as much pulp might have been produced without cutting one additional pulp log as is manufactured from 36,000 cords of wood. This is considerably more pulp than Nova Scotia produced during 1910. The sooner such practical economy and utilization of waste commences, the longer will Canada have an adequate supply of pulpwood.

The extent to which different woods are used in different processes in each province is shown in Table 3.

Table 3.

In Quebec, seven-tenths of the wood used was spruce, balsam fir made up 28 per cent., and the remainder consisted of small quantities of hemlock and poplar. Both Quebec and Nova Scotia cut the four species used for pulpwood in Canada. No hemlock was reported from Ontario, in which province 90 per cent. of the consumption was spruce and the remainder was balsam fir. Spruce made up four-fifths of the consumption in Nova Scotia, balsam being used for practically all the balance. New Brunswick used spruce only.

Nearly four-fifths, namely, 78 per cent., of the pulpwood manufactured in Canada in 1910 was manufactured by the mechanical process; the sulphite process produced one-fifth, and the remainder (2 per cent.) was manufactured by the soda process. Quebec made 63 per cent. of the total mechanical pulp in Canada—more than twice as much as did Ontario. Of sulphite pulp, Ontario produced the most, although Quebec was a close second. The latter province manufactured over three-quarters of the pulp made by the soda process.

Spruce, as in former years, was the chief wood used in each process. Over two-thirds (68.8 per cent.) was used for mechanical pulp; over one-quarter (28.7 per cent.) was made into sulphite pulp, and the remaining 2.5 per cent. was manufactured by the soda process.

Balsam fir has not yet been used in the soda process and is used to almost the same extent with the two other processes. The mechanical process consumed some 53 per cent. of this wood, while 47 per cent. was manufactured by the sulphite process. Eighty-four per cent. of the hemlock was manufactured by the soda process, which is adapted for most species of wood. One-sixth of the hemlock was used to make mechanical pulp.

The physical properties of poplar wood do not adapt it for grinding by the mechanical process, and practically no poplar was manufactured by this process during 1910. It was used in almost equal quantities by the other two classes of manufacturers.

Ontario manufactured a little by the soda process; only ground pulp was made in Nova Scotia; while New Brunswick produced small quantities of both sulphite and soda pulp.

#### Mechanical Process

Pulp manufactured by the mechanical process forms a greater percentage of the total during 1910 than at any time in the past. In the United States the percentage of ground pulp used is decreasing. The cause of the increase this year in Canada is probably due to the interruption of manufacture by the sulphite mills of New Brunswick. Unlimited supply of clean water is a necessity in the manufacture of wood by the mechanical process. A species of wood is also required which has a long loose fibre, which will not lose its shape and texture in the grinding. For these reasons Quebec with its spruce and balsam fir tracts and numberless waterfalls is the province best adapted for mechanical pulp manufacture.

Spruce furnished 83.2 per cent. of the wood used for mechanical pulp, and balsam fir contributed 16.6 per cent., with small quantities of hemlock and poplar making up the balance.

The average cord of wood reduced by the mechanical process in Canada during 1910 produced 1,908 pounds of pulp. This is 257 pounds more per cord than was produced last year, but such comparisons depend greatly on

the relative condition of air-dryness of pulp. Slightly over half this amount of pulp is produced per cord of wood by either the sulphite or soda process, but the quality of texture is much better. The paper used in the average newspaper of to-day is composed of about twenty-five per cent. of sulphite fibre and seventy-five per cent. of the ground-wood fibre made by the mechanical process.

#### Sulphite Process

Seventy per cent. of the wood used in the sulphite process was spruce. In British Columbia, experiments are being carried on with the sulphite process, and, in 1910, 440 cords of spruce were used in the manufacture of paper.

Mostly from Ontario. Balsam fir furnished 29 per cent., about three-quarters of which was from Quebec, and the same province used 1,800 cords of poplar to make sulphite pulp.

The average production of pulp for every cord of wood used in the sulphite process during 1910 was 997 pounds.

#### Soda Process

Canada has the distinction of having the oldest soda mill in America, although the process is, at present, not in general use, and is found in only a few small mills. The production by this process, however, will shortly be increased by the completion of a large new mill, for the manufacture of 'Kraft' paper from soda pulp.

The soda process was the principal method used in the reduction of hemlock. Small quantities of spruce and poplar were also used in 1910. Balsam fir, however, is not suited to this process. Of the total, spruce formed 71 per cent.; hemlock 19 per cent., and poplar, 10 per cent.

Quebec manufactured over three-quarters of the pulp made by the soda process; 17 per cent. of the soda pulp was from New Brunswick, and 1,100 cords of poplar consumed by this method in Ontario made up seven per cent. of the total.

The average amount of soda pulp produced per cord was 987 pounds, or 10 pounds less than by the sulphite process.

In Table 4 the information given in the first three tables is collected and presented in tabular form, giving more details.

Pulpwood, 1910, by provinces, species and processes; number of mills, quantity of pulpwood used, quantity of pulp produced, quantity of each species of wood used, quantity produced by each process, total cost and average cost per cord.

Table 4.

The annual consumption of pulpwood per mill in Canada, during 1910, was 11,735 cords, as compared with a consumption of 12,442 cords per mill in 1909. The largest mills are those in Ontario, which used an average of 14,037 cords per mill. The average consumption per mill in Quebec was 13,710 cords; in Nova Scotia, 4,934 cords, and in New Brunswick, 3,783 cords.

#### Exports

Canada's foreign trade in pulpwood and wood-pulp is growing greater. Unfortunately, the tendency is still to export wood in the raw form of pulpwood rather than in the manufactured form of wood-pulp. This is a direct loss to the country, for the increased value due to manufacture is given away. The data in the following tables refer to the calendar years, and have been furnished by the Department of Trade and Commerce.

In 1910, for the first time, \$49,000 worth of pulp was imported into Canada, four fifths of which was from the United States.

Although pulpwood production was less in Canada during 1910 than during the year previous, exportations of wood-pulp were increased by 48,233 tons. Wood-pulp exportations amounted in 1910, to 69.3 per cent. of the total amount produced in Canada, whereas in 1909 it was only 63 per cent. Of the 328,977 tons of wood-pulp exported, 288,807 tons, or 87.8 per cent., was mechanical pulp, which is a little greater percentage than in 1909. Only 78 per cent. of the pulp manufactured in Canada was mechanically prepared. While the increase in export for 1910 consisted of mechanical pulp, 1,173 tons more of chemical pulp also were exported in 1910 than during 1909. The 40,170 tons of chemical pulp shipped made up 12.2 per cent. of the total export.

Export of wood-pulp, 1909, and 1910; quantity, value, per cent. distribution and chief countries importing.

To United States.....	37,336	1,459,340	95.7	39,947	1,451,068	99.5
To United Kingdom.....	1,049	42,007	2.7	178	7,398	0.4
To other countries.....	609	19,270	1.6	45	1,725	0.1

(1) Includes the following countries given in their order of importance:—France, Belgium, Mexico, Australia, Cuba and Japan.

Table 5.

The average value per ton of the pulp exported in 1909 was \$14.67 for the mechanical, and \$36.35 for the chemical pulp. This is an increase over the 1909 price of 70 cents for the mechanical, and a decrease of \$2.64 for the chemical pulp. The average price for all pulpwood exported was \$17.31, or 14 cents less per ton than the previous year's price. The prices per ton paid to Canadian exporters by the different importing countries were as follows for the mechanical pulp: United States, \$16.09 (exactly the same as in 1909); United Kingdom, \$15.78 (\$5.52 more than in 1909); other countries, \$10.35 (37 cents more than in 1909). For chemical pulp: United States, \$36.32; United Kingdom, \$41.60; other countries, \$38.30.

During 1910, over three-quarters of the wood-pulp exported went to the United States. This country took 74.3 per cent. of the mechanical pulp and over 99 per cent. of the chemical pulp exported from Canada in 1910. Except for an increase of 3,000 tons of mechanical pulp to small transatlantic countries, export to other countries decreased. The export of chemical pulp to the United Kingdom has fallen off from 7,519 tons in 1908, to 178 tons (not one-fortieth as much) in 1910. The mechanical pulp shipped to the British Isles also decreased by 16,407 tons during 1910. The United Kingdom received in 1909, 32.5 per cent. of the mechanical pulp exported from Canada, while in 1910, only 21.5 per cent. of the amount exported was used in those countries.

The export of pulpwood in a raw state is increasing yearly, and by just so much as this in the case does Canada lose the benefits to be derived from its manufacture and the increased value of raw products. All raw pulpwood is exported to the United States.

In Table 6 a detailed statement is given of the quantities of pulpwood manufactured in Canada and exported raw.

Canadian pulpwood exported unmanufactured vs. that manufactured in Canada, 1909 and 1910: quantity, value and per cent. distribution.

	1909.			1910.		
	Quantity.	Value.	Per Cent.	Quantity.	Value.	Per Cent.
	Cords.	\$		Cords.	\$	
Pulpwood produced in Canada.....	1,537,762	9,216,739	100	1,541,628	9,795,196	100
Manufactured in Canada.....	622,129	3,464,080	40.5	598,487	3,585,154	38.8
Exported in raw state.....	915,633	5,752,659	59.5	943,141	6,210,042	61.2

Table 6.

In 1910, only some 4,000 cords more wood were cut for pulp in Canada than in 1909. Of the 1910 amount of 1,541,628 cords, 23,642 cords less were manufactured in Canada than in 1909, and 27,508 cords more were exported. This gradual change is not so noticeable in the comparative percentages, but even here it may be seen that Canada is increasing the proportion of her natural resources exported in the raw state.

Over 60 per cent. of the pulpwood cut in Canada during 1910 was sent out of the country without further labor being expended on it. The United States manufactured it into pulp and paper. The amount paid for this wood was \$6,210,042, or an average of \$6.58 per cord. As the average paid by Canadian mills was \$6, this is an average of 58 cents per cord more paid for exported pulpwood at the point of shipment.

From United States Forest Products Bulletins it is seen that approximately two-fifths of the pulpwood imported by that country is manufactured into mechanical pulp, and three-fifths into sulphite pulp, and that a cord of wood produces about one ton of mechanical pulp, or half a ton of chemical pulp. This means that from the 943,141 cords of Canadian pulp-

wood sent to the United States, 377,256 tons of mechanical pulp were made, and 282,992 tons of sulphite pulp. The value of these 660,248 tons of pulp, for which, in the form of pulpwood, Canada received \$6,210,042, was, at the average price (\$20.49 per ton) paid in 1910 by United States importers of wood-pulp, \$13,528,481. Thus Canada did not get one-half the amount she should have received if all the pulpwood were converted into pulp on Canadian soil. As the United States does not export 2 per cent. of the amount it imports, there need be no fear that a market for Canadian wood-pulp would be lacking. The United States would pay \$20.49 per ton for the wood-pulp instead of \$6.58 per cord for pulpwood.

As the 1910 report of the United States pulpwood consumption has not been issued, comparisons cannot be made between the two countries for 1910. In 1909, however, the pulpwood shipped from Canada, consisting of spruce and poplar logs, furnished 22.8 per cent. of the entire pulpwood consumption of the United States. This means that 58 of the 253 pulp mills of the United States ran for the year, employed help and paid profits on raw products furnished by Canada. The three most important pulpwood states of the union benefitted from Canada's resources as follows: New York state drew nearly one-half, or 48 per cent., of its pulpwood from Canadian forests; 18 per cent. of Maine's consumption was Canadian logs, and 30 per cent. of the pulpwood used in New Hampshire came from Canada.

If the pulpwood exported in 1910 had been reduced to pulp in Canada, it would have supplied 80 mills of the average size of those in Canada. Thus 131 mills instead of 51 would have been operating in Canada, would have been employing labor and advancing Canadian industry.

The provincial laws affecting the export of pulpwood within the exporting provinces have changed considerably in 1910. In 1909, pulpwood from private lands in Ontario and from all lands in Quebec and New Brunswick could be shipped to points outside of Canada. In 1910, the province of Quebec issued more restrictive regulations, the effect of which was to permit exportation of unmanufactured wood cut only on private lands within the province, and in 1911, New Brunswick passed legislation to the same effect. These regulations, however, did not affect the 1910 export trade, as they came into force later. Authoritative information supplied by the Department of Customs leads to the statement that the total pulpwood export was cut from the various provinces in the following amounts and values: 779,000 cords, worth \$5,090,000, from the timber limits of Quebec; 90,000 cords, worth \$647,000, from New Brunswick, and 74,000 cords, worth \$473,000, from Ontario.

It is interesting to note to what extent provincial industry would have been increased if the pulpwood exported to the United States had been converted into wood-pulp on Canadian soil.

The 779,000 cords exported from Quebec would have supplied material for a year to fifty-six pulp mills of the average size operating in Quebec. In Ontario, five mills of the average size could have been kept running with the pulp logs exported from this province. The 90,000 cords shipped from the ports of New Brunswick would have produced the most startling results, if the amount had been manufactured into pulp within that province. The amount exported was sufficient to supply with wood twenty-four mills of the average size, with the result that five times the actual number of mills operating would have been at work if Canadians had been far-seeing enough to manufacture their own raw products.

### More U. S. Decisions About Pulp and Paper

To be entitled to free entry into the United States from Canada, wood pulp and paper must be the product of the woods of the Dominion, and not Canadian manufacture of foreign materials, according to a decision by the Secretary of the United States Treasury. The question was raised on a recent importation at Detroit, Mich., of paper from Canada. It developed that this paper was made in Canada from wood pulp imported into that country from Sweden. American importers of Swedish wood pulp and paper were among those who recently appealed under the "most favored nation" clause of the commercial treaties for the abolition of the tariff on those articles imported direct into the United States.

One of the results of the representations made by European countries to be placed on an equality with Canada, in the matter of tariff restrictions upon pulp entering the United States, has been announced in the order passed by the United States Treasury Department prohibiting the free importation of wood cut from Ontario Indian lands. The Indian lands are thus placed in the same class as Crown lands, upon which exportation restrictions are placed.

### Ottawa Valley Exports to United States

The accompanying table shows the value of exports of lumber, etc., from Ottawa Consular District during 1911 and 1910:

	1911	1910
	\$	\$
Lumber and Log Products.....		
Ash.....	11,475.18	15,176.77
Basswood.....	5,993.78	12,485.57
Hemlock.....	11,295.24	11,353.49
Lath.....	107,165.03	113,812.26
Pickets.....	58,063.95	64,022.48
Railway Ties.....	14,561.68	20,700.48
Red Pine.....	11,037.70	10,694.27

Newsprint Paper.....	653,162.67	536,708.56
Wood Pulp Ground.....	542,836.52	377,251.19

# Berlin "NINETY" Matcher

## CYLINDERS

Berlin fast-feed cylinder heads cannot be ruined. The gibs used are of hardened steel. There are no wearing parts that form a part of the head itself. The size of the spindle next the head shows that it will not spring under the cut. The gib forms the lip for the under side of the knife, thus forming no place for chips to wedge in.

## SIDE HEADS

12-bitted ship-lap or 6-bitted round jointer heads may also be furnished if desired. These heads as well as others may all be sharpened on our Pedestal Side-head Grinder. We have the only 12-bitted side-heads ever manufactured. Side-head jointer is also furnished.

## BELT TIGHTENERS

There are two features about our automatic belt tightener construction that stand out prominent. In a recent test covering a period of nine months, night and day run in one of the largest plants in the world, a Berlin "90,"

a stock-model as above, ran night and day for over nine months and during that entire period not a single belt was taken up. Every tightener is automatic, works on the slack side of the belt, and the belts may be released by lifting up the tightener pulleys. These flexible tighteners as compared with the screw method by which terrific pressure and friction is applied to the belt, make a saving of 25 to 50 per cent. in the horse-power required to drive the machine. Belts may be put on endless and run for months and year without being taken up. There is no unnecessary strain on the belts and the heads will handle the heaviest cuts. The life of the belts is tripled.

## CHAIN DRIVE

In place of the great number of gears which are found on any other matcher, the number of which run up to 30 to a machine, we designed an automobile chain drive consisting of a power automobile chain running over hardened steel sprockets. This applies to both front and rear rolls, reducing the number of gears on the entire machine to a minimum and affording a drive that is positive and will never give trouble. The chain drive used on

# Berlin Machine

Plants : Hamilton, Canada

# with Profiling Attachment

*Manufactures Flooring, ship-lap, drop-siding, V or beaded ceiling, partition, casings, base or similar work at 180 to 200 feet-per-minute. Guaranteed.*

Berlin fast-feed matchers, by actual test, is capable of transmitting seven times the work required of it. It is practically noiseless in operation and transmits no vibration to the working parts. Every part is protected from shavings but is instantly accessible. Belt with tightener connects the in-feeding and outfeeding rolls.

## PROFILING ATTACHMENT

The most simple device on the market of its kind. Consists of two heavy spindles at out-feeding end of machine, driven by one belt, with tightener. Both spindles are carried between double bearings, exactly like that of the cylinder heads. End play in spindles is automatically kept out all of the time and wear does not effect our device in any way. Cross-adjustment is also provided. The profiling heads are 6-bitted and may be furnished for all styles of work and the tightening operation self-centers them on the spindle. Changes for different runs may be made in a few moments time. Jointing devices for top and bottom heads are furnished and the knives may be jointed no matter what form they take.

## FRAME OF MACHINE

Cast-in-one solid piece, affording the sturdiest foundation a machine could run on. While some say there is no advantage, the real reason is that no other wood-working machine foundry has the facilities to cast matcher frames in one piece. Any practical man can see that with the one-piece frame and the weight properly proportioned, the vibration is considerably lessened and the machine will always be in line even if the floor sags a little.

## FEED-ROLL POWER

Spring tension on all feed rolls, thus automatically regulating the pressure on stock as well as feed power consumed and removes all jar so common on weighted roll machines by the entrance of heavy stock under the rolls and again when they drop off. Springs are adjustable to suit any weight of stock of varying thickness.

## SPEEDS OF FEED

Guaranteed to turn out perfect flooring and ship-lap at 200-feet-per-minute and handle formed patterns such as drop-siding, partition, base, casings, etc., at from 150 to 180-feet-per-minute.

# Report of Timber Cut on Crown Lands

Department of Interior Returns for Year Ending March 31, 1911—Over 203,000,000 feet Manufactured and 210,000,000 feet Sold — Statistics of Quantities and Prices

The report of the Department of the Interior for the year ending March 31, 1911, has just been issued. It includes as usual a great deal of interesting information regarding lumbering operations upon Dominion Lands. The Deputy Minister of the Interior in his introduction to the report refers as follows to Forestry matters:

A number of additions have been made to the forest reserves, increasing the area reserved from 3,450,720 acres to 16,128,640 acres. The most notable addition is the Rocky Mountain Forest Reserve, covering all the eastern slope of the Rocky Mountains in the province of Alberta above a general elevation of four thousand feet above sea level. The boundary of the reserve was determined after a careful examination on the ground by two forest survey parties. All agricultural land has been excluded and nearly all grazing land. The grazing lands included are narrow strips in the valleys of the rivers. This reserve forms the watershed for the provinces of Alberta and Saskatchewan and the preservation of the timber of the slope is therefore of the utmost importance. Steps will be taken to organize an efficient protective force and to provide for the management of the timber on proper scientific principles.

Unfortunately, last year was a dry season in the west and forest fires did great damage. This was particularly the case in the province of Alberta where the forests on the Rocky Mountains suffered severely. As, however, the states of Montana and Idaho, immediately to the south, had much greater losses, including loss of life, although the expenditure on protection there has been much greater, Canada may feel that under the circumstances she has escaped very well. It emphasizes, however, the necessity for perfecting the protective service in every way possible.

## Revenue from Timber Agencies

Mr. B. L. York, chief of the timber and grazing branch, in his report writes as follows:

The revenue derived from timber, grazing lands and hay lands for the fiscal year amounted to \$459,216.04, being an increase of \$4,267.41 over the previous year.

The revenue derived from timber and grazing lands received at the Crown Timber Agencies, together with the ruling price of lumber, the number of mills being operated on berths held under license, and the number of portable sawmills in operation, may be summarized as follows.

Agency	Total Revenue	Average Price at mills	Mills Under license	Portable mills
Calgary ... ..	\$ 32,070.95	\$15.77	15	18
Edmonton ... ..	52,716.50	16.00	17	20
Prince Albert ... ..	46,526.25	20.57	4	18
Winnipeg ... ..	95,979.69	16.52	31	28
New Westminster ... ..	120,515.91	14.44	7	4
Revelstoke ... ..	23,191.87	17.92	11	..

The returns of operations received show the following quantities of building material as having been manufactured and sold under government license during the year in the timber agencies above referred to.

	Manufactured	Sold
Sawn lumber, ft. B. M. ... ..	203,239,660	210,120,568
Shingles ... ..	268,000	268,000
Shingle bolts, cords ... ..	6,908	6,908
Railway ties... ..	112,672	260,604
Laths ... ..	17,261,143	22,070,213

The following material was manufactured and sold on permit berths and portable sawmill berths:

	Manufactured	Sold
Sawn lumber, ft. B.M. ... ..	25,288,555	33,809,742
Railway ties... ..	1,500	7,820

The areas of timber lands held under license and permit in the provinces of Manitoba, Saskatchewan, Alberta, the Northwest Territories, and the railway belt in the province of British Columbia on March 31, 1911, were as

	Under License Square Miles	Under Permit Square Miles
Manitoba ... ..	1,037.90	399.31
Alberta ... ..	2,196.58	67.26
Saskatchewan ... ..	2,193.83	371.82
The Northwest Territories ... ..	245.02	...
British Columbia ... ..	1,926.06	21.18
Total ... ..	7,599.39	859.57

Of the total receipts of \$459,216 as shown above the receipts from timber amounted to \$376,944.

Mr. E. F. Stephenson, Inspector of Crown Timber Agencies in his report writes as follows:

Of the area of timber land, held under license, not more than thirty per cent. is being operated upon. This, to a small extent, is due to the timber lying in districts which do not as yet afford facilities for placing the product upon the market. In large proportion the timber is being held as an investment, the increment in value upon which is steadily growing. The licensees of berths granted five years ago and over, who have no mill in connection with their holdings, and are not meeting the requirements of the timber regulations as to the manufacture, are taxed increased rental; in some cases the rental is doubled and in others four times the ordinary rental is charged. The imposing of this penalty is considered a hardship by the licensees whose berths are so situated that they cannot be success-

fully worked for lack of shipping facilities, but, in the main, the additional rental charge cannot be reasonably held a matter of complaint.

The berths sold during the year brought good prices, ranging from fifty cents to \$9.50 per thousand feet, according to the quality and position of the standing timber.

For the past ten years, millions of American capital have been invested in acquiring Dominion timber in the west. The lumbering business is now largely in the control of Americans, who have been forced out of Wisconsin, Michigan and parts of Minnesota, owing to these states being largely denuded of timber. They have shown themselves, in their operations, experienced lumbermen, careful of waste in their bush operations, and to make the most of the manufacture at the mill. This would apply also to our larger Canadian millmen who show equal enterprise and ability in conducting their business.

It is a matter, to my mind, for consideration, whether the time has not been reached for withdrawing the privilege accorded to owners of portable sawmills, in districts which are well supplied with lumber markets stocked by the legitimate lumbermen. The destruction of lumber, through the operations of these itinerant lumbermen, as the result of the method employed in their cutting, and the increased danger from fire in the timber on the tract cut upon, are altogether too great to be met by the small advantage gained by a comparative few, who are served by these mills. Apart from those districts which are remote from a line of railway and from a lumber market, I do not think it is in the public interest to continue to award berths to the owners of portable saw mills. This view, I believe, is shared by all the officers in the west who are familiar with the working of these mills.

## Consumption of Lumber on the Prairies

From statistics carefully gathered, I am able to give you the amounts of lumber marketed in Manitoba, Saskatchewan and Alberta, during the year:

From British Columbia mills ... ..	620,000,000
From Western Ontario (pine) ... ..	140,000,000
From United States ... ..	122,000,000
Manufactured within above provinces (spruce) ... ..	135,524,202

Total ... .. 1,017,524,202

In the quantity of lumber from British Columbia, 88,773,929 feet were cut within the railway belt, upon Dominion Lands, the remainder came from the Mountain and coast mills, operating under provincial license. Owing to the slackness in the lumber trade in the western states, the shipments from the American mills to western Canada, where the market was active, were much larger than for many years past, totalling 122,000,000 feet. In addition to lumber, there was also imported from the United States 9,000,000 lath and 2,000,000 shingles.

Mr. Stephenson's report gives the following statistics of timber products manufactured, sold and in stock by holders of timber berths on Dominion lands, cut under yearly license during the departmental year ended March 31, 1911 and 1910:—Lumber manufactured 1911, 203,239,661 ft.; 1910, 214,981,743 ft.; lumber sold 1911, 210,120,568 ft.; 1910, 279,130,546 ft.; lumber on hand 1911, 40,584,365 ft.; 1910, 50,331,689 ft.

## Increased Operations in Northern Alberta

Mr. K. W. MacKenzie, Crown Timber Agent at Edmonton, Alberta, in his report writes as follows:

The new Rocky Mountains forest reserve now being located is situated largely in this agency and will be of inestimable value in protecting the headwaters of the numerous rivers rising in the foothills, and providing a future source of timber supply for the prairie country to the east.

The year's manufacture of lumber was as follows:

	Ft. B.M.
(a) By licensed berth holders ... ..	15,116,146
(b) By permit berth holders ... ..	5,879,222
(c) By portable sawmills under settlers' permits ... ..	9,236,244

Timber permits issued during the year covered the following: 1,609,516 lineal feet building logs; 5,638,832 feet B.M. sawn lumber; 1,538,574 fence rails; 217,717 roof poles; 371,795 fence posts; 1,321 cords of wood; 968,500 8-foot railway ties; 18,948 telephone poles.

It will be noticed that the revenue collected again shows a remarkable increase, from \$37,719.79 to \$52,716.50.

Mr. J. R. Sutherland, Crown Timber Agent at Calgary, Alberta, in his report writes as follows:—

The quantity of lumber manufactured from licensed berths during the twelve months amounted to 18,035,498 ft. B.M., quantity sold 15,382,126 ft. B.M., manufactured by portable mills under permits 4,134,344 ft. B.M. lumber, quantity sold 3,225,584; total quantity on hand, 10,183,758 ft. In addition to the 22,169,842 ft. B.M. manufactured as above stated, there has probably been about 150,000,000 ft. brought into this province from the province of British Columbia, but apparently nothing has been imported from the United States. I would estimate that the log crop amounted to 19,164,000 ft., in addition to, say, 9,120,000 ft., estimated as being the quantity left over from the cut of 1909 and 1910, which will make 28,284,000 ft., which the mill owners will require to manufacture into lumber during the season. I may add that \$15.77 per thousand ft. B.M. is the average price at which the lumber taken from licensed and permit berths sold during the past year.

Mr. George L. Dempster, Crown Timber Agent at Prince Albert, in his report writes as follows:—

The sales of lumber manufactured under license in this agency amount to 33,944,805 feet board measure, the average price being \$20.57½ per thousand

feet. This is an increase of \$2.10 1/6 per thousand feet over last year's selling price. During the past winter 592,737 pieces have been manufactured in excess of the quantity taken out during the preceding logging season. This increased cut, together with the fact that two new mills are being erected, one at Big River and one at The Pas Mission, will mean a large increase in the manufacture of spruce lumber in this district during the coming year. The mill at Big River is to have a capacity of 200,000 feet in ten hours and the mill at The Pas Mission will be as large, if not larger. The number of timber permits issued is 1,149 as against 1,033 for the preceding year. These permits cover the following quantities of lumber:—Lumber, feet B.M., 17,749,525 logs, lineal feet, 162,484; cordwood, 28,212 cords; fence posts, 249,117; fence rails, 91,488; poles, 179,768; shingles, 8,000; railway ties, 6,500.

Mr. Edward Walmsley, Acting Crown Timber Agent at New Westminster, in his report writes as follows:—

The revenue collected for the year amounts to \$120,515.91. The extent of the operations during this period on lands under license, shows a decrease in saw logs of 66,878,350 feet B.M. and is explained by the reduced area now under license within this agency. In this connection, however, I may say that lumbermen still continue to conserve their holdings of Dominion timber, which is considered a safe and profitable investment, well protected during the summer months by an efficient corps of fire rangers employed by the department and working under the direction of this office. The average selling price of lumber was \$14 per thousand feet B.M.

#### Heavy Imports from United States

Mr. C. W. Smith, Acting Crown Timber Agent at Revelstoke, B.C., in his report writes as follows:—

There is a steady demand in the prairie provinces as heretofore, but heavy shipments of common lumber are being rushed by American firms into Manitoba, Saskatchewan and Alberta, the natural market for the British Columbia output; consequently, the British Columbia people are not going to participate generally in the increased business impending to the extent that at one time was anticipated. Compelled, too, for financial reasons, to dispose of their stocks, these American firms are flooding the market and unduly keeping down prices. Some, it is affirmed, are even selling below cost, the prices realized in some cases being no more than seven to nine dollars per thousand at the mill, allowing for freight and other charges. The average price at which lumber sold during the year was \$17.92.

Regarding the fire service, Mr. Smith reports as follows:—

The summer of 1910 may be considered as one of the worst on record for the number and extent of forest fires occurring in British Columbia. An unusually hot, dry season, the brush dried out like tinder and was readily set alight, spreading with great rapidity before it could be checked. The average number of fires were caused by sparks from railway locomotives and lightning. Some were due to carelessness on the part of settlers in clearing land, one large fire, in particular, started in April, 1910, south of Revelstoke by a squatter burning brush, doing considerable damage before being extinguished. Care should be taken by the foreman in charge of the gangs employed on the new provincial roads being constructed throughout the dis-

trict, to see that the brush and slash are cleared away. This, if lying around, dries out to the extent that matches and cigar stumps thrown from a rig will readily set it alight.

#### Hemlock Grading Rules

St. Jovite Sta., Que, Jan. 31, 1912.

Editor Canada Lumberman:—I do not think it possible to draw up a set of rules for the grading and inspection of hemlock that would be satisfactory to the manufacturers and wholesalers of hemlock in western Ontario and also those in the Ottawa valley and Quebec. Each section calls for a different grading to satisfy the trade and the grading that might be satisfactory in western Ontario would not be satisfactory in the Ottawa valley or other parts of Quebec as each section demands a grading to suit its own trade.

Yours truly,

J. B. WHITE,  
Mgr. Wood Dept. and Saw Mills.  
Riordon Paper Co., Ltd.

#### Lumber Industry Investigations

Mr. Emil P. Secker has been appointed commercial agent of the United States Department of Commerce and Labor to make investigations with respect to trade conditions in the lumber industry in foreign countries. Mr. Secker will make certain preliminary investigations in the United States, covering a period of about six weeks, with a view to securing information which will aid in his investigations abroad. He has been authorized to visit Baltimore, Md., Pittsburgh, Pa., Cincinnati, Ohio, Chicago, Ill., Wausau, Wis., St. Louis, Mo., Memphis, Tenn., and New Orleans, La., to confer with trade organizations and others interested in the trade in question. After these preliminary investigations are completed Mr. Secker will go abroad, and his reports will be published by the Bureau of Manufacturers.

The Legislature of the Province of Quebec has under consideration the passing of an act making a railway company responsible for losses up to \$5,000 caused by sparks from its locomotives. At present there is an act in force under which it is necessary to prove carelessness on the part of the railway company. Under the new act all that will be necessary to prove is that a spark from the locomotive caused the fire, and damages will then be assessed. In the past the railroads have been responsible for a great loss of timber.

The export of Forest Products from Canada from 1868 to 1911 are shown above in a statistical table issued by the Department of Trade and Commerce. The figures for the year 1907 are for nine months only as the date of the fiscal year was then altered.

# Stocking Up for Spring

The Retailer's Tribulations

Written Specially for the  
Canada Lumberman by  
George Wilson Jones.

We arrived at D—in a blizzard, Dan Waterman, Joe Lemay, and myself. Dan is one of those elderly salesmen who has sold everything from baby-carriages to light-houses, and somehow, somehow, had at length found a berth with a sash and door house. Joe, contrariwise, was the product of the mill. He had started in when a youngster helping the cook in a lumber camp, and from there had worked his way up till after a number of years he found himself selling the actual lumber. My breaking into the sacred circle of salesmen was by another route. I had run a retail yard for a number of years, but becoming interested in some yellow pine land had finally abandoned my yard to take a more active interest in marketing the product of our mill, and was now leading a hope more or less forlorn of making my former competitors believe that yellow pine would do everything any other wood did, and then some. Whether my job was a cinch or not is a secret locked in the cash drawer of my heart. I may say in my own defence, without fear of convicting myself, that I am still far enough ahead of the town constable and sheriff to be able to leave a town in broad day light and with a brass band ahead of me if I so choose, only I didn't.

To get back to Dan and Joe,—Joe was the kid of the party, but only in years. His experience had developed those traits that make a real man, and so all of us who made the territory in the eastern provinces liked to meet up with Joe on our trips. Joe and I often had it out respecting an opinion on the lumber situation. His argument was this: I had been a retail lumber dealer and had not been close enough to actual manufacturing conditions long enough or thoroughly enough to be entitled to an opinion. In other words, what I peddled out as knowledge was only hearsay, and so not strictly admissible in polite lumber society. As for Joe's opinion of Dan's qualifications, why Dan was only an amateur, even though a gray headed one, and as for sash, doors, blinds and such stuff, they weren't lumber anyway. We would find each other on the same train, start a game of seven-up, but before two hands had been played, would neglect the game and scrap over the old question of our position in the lumber fraternity. This night the train was late and we piled out at the station, jumped into the bus, and headed for the hotel, too intent on a warm dinner to care whether we were lumbermen of 100 percent purity or merely mavericks. We found the clerk at the Dawes House glad to welcome us. We always made it a point to head for the Dawes because it was famous up and down the road for its good grub. The next morning when we poked our noses out of doors, we found a whale of a storm had visited the town during the night and the snow was piled high over the walks and street, but we were not sentimental enough to stay in doors just on this account. We headed for Evans & Smith's yard, plowing through the dry loose snow up to our knees, or more accurately, up to the tops of Dan Waterman's high overshoes. These were his one special vanity. They were of black buckskin embroidered around the seams. Each fall so soon as the snow came, Dan would get a new pair with specially heavy corrugations on the soles and heels, and he kept up a constant oration anent their superlative qualities until the balmy breath of spring made their use unnecessary and uncomfortable. When we got to Evans's office we found him in the door watching one of his yard men driving a plow down the walk.

"Come on in, boys!" he called, and we tumbled in with a general hallabaloo, stamping, snorting, and shaking our coats and caps. "Some blizzard, this, don't you think?" he asked, or rather said, for he didn't wait for an answer. "Throw your duds on the table and draw up to the stove." Which order we obeyed with the alacrity and precision of a squad of the Queen's Own Rifles. By the time we had gotten into our chairs, Evans had beaten us to it by producing his box of cigars, much to Dan's disgust for he always prided himself on doing the proper etiquette stunt in passing the smokes. His hand passed from his pocket where he was reaching for his cigars to the box before him, and soon he too was tasting the splendid blend of Evans's perfectos.

## Getting Down to Brass Tacks

The influence of the snow must have had something to do with our moods, for no one pulled an order blank or started anything leading up to its use. We discussed trade in general and after various phases had received a desultory treatment, Joe let his practicality shine by getting down to brass tacks.

"Now according to my way of thinking, you ought to be able from your inventory and experience to make up an order for spring trade that would save you a lot of trouble later on. You retailers wait too long. You don't think that a man like myself who knows

the game from stump to shingle can give you a tip that will mean good, hard dollars in your pocket before the season is over. You shop around and then raise a deuce of a howl because you run out just when you need the stuff, and the galoot you gave your order to can't fill it because the mills have their own trade to take care of and can't monkey with a little runt of a commission man with his office on his name card."

"That's the proper dope," Dan broke in. "I remember when I was selling clothing for Sheppard &——"

"What the dickens do we care for your coats and vests?" Joe interrupted, "what we're interested in is getting Mr. Evans to buy when the market is right. I don't give any phoney steers, because I'm coming back over this trail again and want to make a clean-up each time. I might string Evans here once, but the next time I'd get the hoopeddoo like Jenkins did who pumped him full of laughing gas and sold him that bum bunch of spruce all full of stain, shake, doze, and the devil knows what all. I've been in the manufacturing end and——"

"Cut it, Joe, cut it! We all know about you and your manufacturing. I suppose the real truth is you did carry water for some gang of Hindoos out on the coast, but what's that got to do with the retail business?" I interpolated this polite rebuke for I didn't want to hear Joe's life story this particular morning, especially as I had learned it by heart from former recitals, and besides I considered my opinion on spring buying really worth something, for hadn't I been graduated from the ancient and honorable school of the retailer myself?

"All right, old sport, go to it!" was Joe's good natured reply, for however much we three cronies blackguarded each other, we didn't have any vinegar in our veins. "But just the same," he went on, "when it comes to knowing what a retailer wants, all your experience running a bob-tailed yard in some whistle station of a town don't cut no ice at all. If your idea is right, Evans here can give me pointers, but he never buys a car until I drop in and put him wise."

Evans grinned at this, while Dan and I were more demonstrative in our mirth, and as it seemed a good place, Evans cut into the talk.

## Piles in the Yard—A Trade Barometer

"Why in blazes don't you fellows quit flocking together if you can't agree, or else settle your everlasting jawing out back of the lumber pile? If I took Lemay's advice, I'd be full of red wood or fir and have no room for Waterman's doors, and if I took your tip, Jonesy, I'd have no room for either, for you'd have me loaded to the gunwales with yellow pine. Both you and Joe are about all right, but you look at the whole proposition from your own standpoint. What I have to do is to study my trade right here in D——, and Waterman knows my trade don't demand the doors and sash he ships over to H——. Just because I think spruce shingles beat cedars, if my trade won't take a spruce shingle, I'd be bucking a tough proposition if I tried to sell nothing but . . . Then you've got to study your yard and see what piles don't go down. Some don't move at all, and these are the ones that lose you money if you don't make them move. Mr. Smith and I had quite an argument on how to treat these hoodoo piles one time, but I take the stand that a customer passes a pile that looks as though it had been on the yard a long time. He thinks if it isn't good enough for other customers, it's not good enough for him."

"Right you are!" Waterman broke in. "I was in a shoe store only last Monday and saw a lady go without buying because the clerk handed her a pair of shoes that had the buttons moved. She thought he was selling her something that some one else had turned down, and she lost confidence in the whole outfit right then and there, and that's how a customer looks on a pile that shows the weather."

"What did you buy, you old cheap skate?" Joe asked.

"Nothin'," Dan replied, "for I kind-a felt the same. Evans here is dead right and if you want your-eustomer to have a come-back feeling, show him clean, bright stock. Why only a couple of weeks back I got a letter from the house to see a customer who couldn't get some doors to sell. I——"

"You don't expect any sensible man to buy your old doors, do you?" Joe and I interrupted in perfect unison.

With only a snort of contempt to show his disgust with such lack of good manners, Dan went on:

"Well, that half-baked geezer had them doors in his shed where the dust had blowed in all summer and the rain had turned the

dust to mud. You can imagine how near I came to doing anything for him, and the house wrote him a letter that would curl your hair for you."

"To get back to my story," Evans continued, "I also saw that our men always took a customer by one of these old piles. They didn't have to work hard to sell the bright stock, you see. Well, one day I tried my hand at it, and stopped before a pile that was showing some weather, but while I talked the customer kept looking to the next pile we had just got in, and began asking about that. I saw the point, and made him a price that sold the old stuff, and have kept up that custom, so we don't have any accumulation of stuff occupying good space and eating up interest besides getting less saleable each day."

"What in blazes has all this to do with spring buying," I asked, for I wanted to get back to the original proposition.

"A whole lot," Joe answered. "For you've got to have bright stock to catch trade."

"Yes," Evans added, "That's just it. Unless something unusual turns up, your trade don't change much, and if you buy too heavy, your stock looks bad, but my rule is to keep my stock normal all the year round, and not gamble on the market. I've watched those fellows who are so all-fired wise and buy heavy when they think the market has reached bottom, but it don't pay to buy anything you don't need just because its cheap. My rule is to buy right, buy of a house you can bank on, and keep your stock up."

"Amen!" ejaculated Dan. "You're orthodox. If we could pound them three rules into the noddles of our customers, we'd be on Easy street all the time. Some men are like a passle of women at a bargain counter, and jump over themselves to get something cheap, but they get stung every time, and what's the result? Why their customers get sore, and their trade drops off, that's all. I used to lose my nerve——"

"What! you loose your nerve?" Joe shouted. "Must have been a queer sensation. I always thought your nerve would stand without hitching."

Dan never batted an eye, but went right on: "when a customer would say he had a price way below mine, but I've got all over that. I just quit and talk about something else, advising him to buy, but I notice that usually after a while he comes back and gives me an order. Bluff, that's what it is, and you want to stand pat."

Just then we heard a commotion at the door, and Billy Seymour joined us. Billy is selling "Tight-roof" ready roofing, and is a mighty square chap. He never bamboozles his trade with any fake instantaneous test for roofing and doesn't claim his roofing is made from the gum of a tree in India owned exclusively by his firm. We all think a roofing salesman something of an interloper, but Billy passed muster soon as he got on the territory. He backed up to the stove and after lighting one of Evans's cigars, poked his hands down in his pants pockets and with his feet pretty far apart, looked us over.

"Say, boys," he began, "the house has one on me for fair. Its sure to get out, and I want to tell it first. You know S———of Collins?"

"Do we know old S———?" Waterman asked, and looked around with a wise twinkle in his eyes, while Joe and I smiled in sympathy. "I should say we did. So he stuck you, did he? I always knew you'd get hurt if you went out without a nurse or some one to keep you out of scrapes."

#### Suspicious Orders—One on the Salesman

"Well, seeing's you all know him, you'll appreciate this. When I started on this territory, I called on all the dealers, and got a nice order from S———. The next time around, I got another. It came so easy I ought to've got wise, but I didn't. This kept right on, till I'd sent in five or six orders. One day in the office, Peters our sales manager called me in to his office and told me I'd been doing pretty well. I began to swell up like a poisoned pup, but after enjoying this for a bit, he said: 'I see you've sent in some nice orders from Mr. S——— of Collins, well don't you know we never shipped any of them. He still owes us for the last lot he got before you took hold, and you can save time in crossing him off your list.' Now what d' you think of that? I'd patted myself on the back, shaken hands with myself, and treated you gents on the strength of those orders, and all the time the house was stringing me."

We had our laugh at Billy's expense, and promised him a dinner that night as a consolation prize, insisting that Evans come along too. He was on hand, and after dinner Joe told us another one on S———.

"I was in Phelps & Co's. office at Collins one day when S——— went by. 'Do you call on him?' Phelps asked me. 'Not so you'd notice,' I says. 'Well,' says Phelps, 'he nearly got into me for some eighty odd dollars a week ago yesterday. I'd be stuck for just

eighty-three dollars and forty cents if my bookkeeper hadn't been onto her job. I'd cautioned her against letting him have anything without the money, but I was out that morning and S——— came in and told her he was all out of  $\frac{3}{8}$  ceiling and had to have it for a rush order, and would send the check back with the driver. This got by her, and she sent the ceiling, but no check came back. This got her dander up and when I came back, she told me and said she'd get the money the next day. Soon as she could she started for his office the next morning, and S——— tried to put her off, for he was busy. She said she'd wait, and took a chair. He went into the yard and stayed about an hour, but she froze to the chair. At noon, he told her she'd better not wait, for he was awfully rushed, but he couldn't get rid of her. He went home to dinner, and she slipped out for a lunch and was back before he returned. He kept her about an hour longer, and seeing it was no go, came across with the kale."

"I'd like to hire that bookkeeper," Evans said rather slowly, as he shook hands all around and we turned in.

#### British Columbia's New Match Company

A meeting of the stockholders of the Dominion Match Company, Ltd., was held recently at Vancouver. The preliminary work of establishing this industry in British Columbia being well under way, the principal stockholders, who have been heretofore the directors of the company, resigned their latter capacity, and turned the control of the company over to a new board of directors, the majority of whom are Vancouver men. Mr. A. E. White, president of the Board of Trade, New Westminster, was elected president of the company; Charles J. Tucker, of Vancouver, vice-president; Ray Thompson, Vancouver, secretary and treasurer, and Mayor John A. Lee, of New Westminster, and John England, of Kamloops, directors. An encouraging report was presented of the progress made in establishing the new industry. A site has been secured at New Westminster, which, having three railroad connections, together with light, power and water, is considered the best in British Columbia. Work has already begun upon the factory buildings, the main building of which is to be 100 by 200 feet, two storeys high. The special machinery is being made in Vancouver, and it is expected that the factory will be completed and turning out large quantities of matches within six months.

#### British Columbia Timber Cut

A total of 1,100,000,000 feet of timber was cut on British Columbia provincial lands during 1911, according to the figures of Provincial Timber Inspector G. D. McKay, who is preparing his reports for the government. This record cut brought into the provincial treasury a sum of \$444,333 in stumpage, royalties and taxes, in addition to the immense revenues from timber licenses and rentals. The total of over a billion feet does not take into consideration the cut on the lands in the railway belt controlled by the Dominion Government in the province. Of this 1,100,000,000 feet of timber, over 45,000,000 feet of lumber was shipped into the United States. The remainder was largely used for consumption in the Dominion. The timber cut for last year is 146,000,000 feet greater than in the previous year, when it totalled 936,000,000, and produced a revenue of \$393,600. Estimating the value of the lumber at \$15 a thousand feet this would make the output worth \$16,000,000.

#### Customs Regulation to be Enforced Strictly

The first case to come up at Winnipeg, involving a dispute about the payment of duty on lumber imported from the United States under the new ruling, which makes lumber dutiable that has been planed on two sides and subsequently roughed on one side so as to obliterate the marks of the planer, was dealt with recently when the C. P. R. was convicted of permitting a car of such material to pass through without being presented to the customs. Considerable uncertainty prevailed about the enforcement of the ruling. Many dealers who had lumber under order, were of opinion that it would be permitted to enter without payment of duty and when they found that the duty was to be collected they made representations to Ottawa, but were not successful. The Department of Customs has advised its officers that the new interpretation of the tariff is to be enforced strictly whenever there is evidence of planing.

#### Want Duty on Shingles

Shingle manufacturers of British Columbia have petitioned the Dominion Government for a duty on shingles, claiming that free imports from the United States are seriously hurting the shingle business of Canada. It is stated that 40,000,000 came in from the United States last year, while none of the Canadian product could overcome the tariff barrier set against them. British Columbia is more affected than any of the other Canadian provinces, as it produces half the shingles made in Canada.

# Canadian Timber in United Kingdom

**Improvement Noted in Trade at Principal Ports—  
Public Sales Well Attended and Bidding Brisk.**

By J. Hammer Quall

Liverpool, Feb. 2.—Sales of lumber at the chief timber ports of the United Kingdom through the first month of the year have been on a scale which has fulfilled anticipations formed towards the close of last year. There has been no extraordinary rush of orders or deliveries, but there has been free selling and much stock has changed hands. At London, the public sales for the year opened satisfactorily. The "company" at each sale was, numerically, as large as could reasonably have been expected, and was well representative of the trade. The bidding was brisk and though in some cases lots were knocked down at figures which were regarded as bargains for the buyers, nearly the whole of the lots were taken up at prices which were regarded as "full" or good. Yellow pine, especially found ready buyers who were prepared to pay good prices for wood which suited their requirements. First quality yellow, 3 x 7, brought £10 10s.; second quality brought £10 and third quality, £9 15s. per standard, which was from 5s. to 10s. per standard above the prices paid a week earlier. Other sizes in yellow deals sold as satisfactory, the results causing very favorable comment. In the first sales of the year some 3 x 11 Montreal spruce of fourth quality was taken up at £8 5s. which was regarded as a low price. Some 2 x 6 unsorted Quebec spruce sold at the same figure. Planed boards were competed for rather keenly and brought good prices. Floorings and matchings sold readily, and though bringing easy prices in the first sales, firmed-up in the later sales and were considered to have sold satisfactorily. In hardwood, oak of good medium quality, chiefly plain, has been in very fair demand. Prime and quartered have sold more freely. The prices of these grades are very firm. White-wood has been in good demand and the price of prime wide has advanced slightly for forward shipment.

At Liverpool, an improved tone prevails in the softwood market and more cheerful views of the prospects of the trade are being taken. A very fair inquiry has been experienced and has kept yards in a state of healthy activity. In spruce, stocks are still within a small compass and parcels coming to hand are easily disposed of. Prices continue very firm and more money is being asked for early shipments. The longer lengths in deals and scantlings are scarce and 2½ x 7 battens also are in short supply. White floorings continue quiet, as regards demand, but prices keep firm.

Pitchpine timber and lumber are having a steady and very fair sale, prime wood being in increasing demand. Prices are still high. Oak has had a steady though moderate sale. The demand for wagon building sorts has been quieter, but this is not at all surprising, in view of the large deliveries of this wood which have gone on lately at the chief ports.

At Manchester, timber is now moving more freely. Inquiries are coming to hand in larger numbers, and some good orders have been booked of late. Spruce continues very firm. The demand is good, and stocks are light. Floorings have sold steadily, in moderate quantities, unsorted bringing £9 12 6. Makers of the cheaper kinds of furniture are more actively employed and are taking more wood, hard and soft, of the sorts used by them. Pitch-pine is in more demand and is dearer. Planks of good quality, especially 9 x 3, are now scarce. Oak, particularly wagon builders' sorts, has sold rather freely. Prices have hardened. Most of the hardwoods are now dearer. The recent advances in freights are pointed to as being the cause of the hardening. The outlook for the timber trade, in the Manchester district has improved. The dispute in the cotton trade has come to an end and work has been resumed at factories which had been stopped for about a fortnight, and a better tone prevails throughout the industry.

On the Tyne, sales of timber have been on a satisfactory scale, the chief industries of the district being actively employed and maintaining a good demand for wood of different kinds. Yellow pine in boards of 1 inch and ¾ inch "down," have sold more freely, for joiners' uses. The shipyards continue to take spruce and redwood deals and battens in fairly large quantities. The coal mining industry, more than maintains its demand for pit-wood; props, spruce-deals and square-wood for staging and for other structural uses. At West Hartlepool, orders have come in freely and good business has been done with railway and colliery companies. Sawn wood, white, yellow, red-wood deals and battens, and pitch-pine has moved more freely and consignments are now being sold to arrive. Quotations for pitch-pine are now higher. The deliveries of wood for colliery uses, above and below ground, have been on a larger scale, and show no sign of falling off. Satisfactory orders have also come in from wagon builders, and have called for more redwood and oak. The sawmills are now well employed. At Hull, the deliveries of soft-

wood and pitch-pine have been on a larger scale, the demand for joiners' uses having improved, and that from the larger industries of the district being well maintained. Oak of all grades is dearer, in keeping with the general rise in the price of this wood, which has taken place. At Sunderland orders for soft-wood have come in more freely. A move has been made in the building trade and wood for builders' purposes is in more demand. At Glasgow the outlook of the trade has brightened considerably since the middle of January. Stocks of softwood are unusually small and quantities have been brought in from other ports to meet urgent demands. Pine deals and sidings and waney pine are all scarce, stocks being inadequate for the present consumption. Oak, birch and elm are in small supply, while the demand for these woods for wagon building, railway and shipbuilding purposes has improved and is fairly active.

## Mountain Lumbermen's Convention

At the annual convention of the Mountain Lumbermen's association held in Nelson, B.C., recently, it was unanimously agreed that the dumping of American low grade lumber into the prairie market had injured the Canadian lumber interests greatly during the past year. A strong resolution declaring in favor of further protection for the lumber, mining and fruit growing industries was passed and the government was urged to foster the development of these branches of industry by means of a revision of the tariff.

It was decided that a resolution on the question of forest fire protection should be prepared and presented to the provincial government and the association asked that the telephone system of the province should be government owned, declaring that privately owned lines had demonstrated the absolute inadequacy of such a service and the inability of the companies to extend telephone lines in accordance with the requirements of the province.

With reference to the reported abolition of the dumping clause in the Canadian customs tariff of 1907 the association went on record to the effect that in its opinion the provisions of the dumping clause should be extended for the protection of the industries of the Dominion and that the provisions should be made applicable to all articles imported from foreign countries and invoiced at prices less than the cost of production. Another resolution urged that the railways endeavor to give relief to the farmers of the prairie provinces in their present need for more cars to remove the immense amount of grain which is awaiting shipment.

A resolution was passed stating that great damage is being done to this country by the policy of certain Canadian railroads, heavily subsidized by the Canadian people, in purchasing many of their supplies, such as lumber, in the United States. It was stated that the association felt that the railroads owed it to the people of Canada to support home industry by buying their supplies whenever possible, in the Dominion.

A resolution was passed in appreciation of the efforts of the boards of trade of the interior, especially the Nelson Board of Trade and the Associated Boards of Trade of Eastern British Columbia, for their efforts in behalf of the lumber industry in the past and the executive of the association has decided to work in close union with the boards of the province, believing that a great deal can be done to educate public sentiment in the necessities of the lumber industry in this way.

Officers were elected as follows: President, Otto Lachmund, Arrowhead; vice-president, F. W. Adolph, Baynes; secretary-treasurer and manager, W. A. Anstie, Calgary. Executive: W. B. Sawyer, Chase, B.C.; E. S. Howe, Jaffray, B.C.; A. E. Watts, Wattsburg, B.C.; W. M. Decow, Paulson, B.C.

## A Practical Coupon System

The Southern Coupon Company, Birmingham, Ala., U.S.A., manufacture a line of coupon books which are of much interest to lumber camp owners, saw mill operators, etc. This coupon book enables the employer to dispense entirely with the laborious system of book-keeping which is such a bugbear to the lumber manufacturing or camp business. The principle of the book is extremely simple. Each work contains a certain number of coupons, which however are not money. They do not in any sense take the place of money. They are simply so many receipts taken by the dealer from the customer for merchandise delivered to him. They are not transferable, hence cannot be circulated as money. They have not the objectionable features common to metal checks which in many cases are now prohibited by law. These coupons enable one to put his business entirely upon a cash basis. They keep the customer in a satisfied frame of mind as there is no possibility of his account being debited with some one else's purchase. They constitute a perfect check on all transfers and form an important inducement to the people of the community to bring all their trade to the company's store.

# Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

## Horizontal Band Resawing Attachment

Wm. B. Mershon & Company of Saginaw, Mich., are producing a new horizontal band resawing attachment intended for use in connection with planers and matchers. There being a limited demand for a tool which will plane and resaw at the same operation, this company have undertaken to supply the demand without making it incumbent upon the purchaser to buy a special planer for the purpose, as the resawing attachment may be used in connection with any standard make of planer.

The bed of the machine is adjustable so as to conform to the height of any planer and matcher and the wheels are likewise adjustable; both simultaneously, for straight sawing, and independently for level sawing, as for the making of bevel siding, etc. The construction of the machine will be readily understood from the accompanying cut.

The saw is guided by patented ball bearing crowding wheels, the advantages claimed for these being that they support and stiffen the saw and cannot clog with sawdust. The machine is also supplied with the latest spring balance straining device—steel locomotive rim wheels—hammered crucible steel arbors with self adjusting and self oiling journal boxes. The resaw is supplied with suitable guards to provide protection to the operator and to give a finished appearance to the machine itself.

The attachment is designed to stand a feed of 200 lineal feet or less per minute according to the character and width of the timber sawn. The machine weighs 5,000 lbs. Additional particulars may be secured from manufacturers.

New Mershon Horizontal Band Resawing Attachment

General Manager, C. H. Kettenring. R. Carey May will act as assistant secretary and C. C. Hoffman as assistant treasurer. The new board of directors is composed of the following: Peter Kettenring, W. A. Kettenring, R. P. Kettenring, C. H. Kettenring, W. R. Strickland, George A. Ensign, C. C. Hoffman and R. Carey May.

## Huthier Bros.' New Catalogue of Woodworking Machinery

Huthier Bros.' Saw Manufacturing Co., Rochester, N.Y., have issued a new edition of their Woodworkers' Catalogue, No. 32., which will be of much value to users of woodworking machinery. The catalogue is profusely illustrated and contains a great deal of valuable information. One of the most interesting devices referred to in the catalogue is the Huthier No. 1 saw guard, table attached, which is shown in the accompanying illustration. These guards are made to attach to the right hand side of the saw table. They can be used for rip or cut-off work, are easily and quickly attached to the machine by a pivoted thumb screw and just as readily removed. The hood can be attached close to the lumber, insuring maximum protection to the worker without hiding the saw or the work. One turn of the clamping handle releases the vertical shaft, when the hood can be raised or lowered as desired or the entire guard swung aside for changing saws or for other purposes. The Huthier No. 2 saw guard is similar to the No. 1, with the exception that it is made with a heavier and longer horizontal shaft and

Huthier No. 1 Saw Guard, Table Attached

a heavier table bracket or clamp. This style therefore is adopted to wider saw tables than the No. 1 style. Readers who are interested in this machine or in this class of woodworking saws may obtain a copy of the catalogue by writing to the company and stating that they have read about it in the Canada Lumberman.

## Defiance Company Elect Officers

At a meeting of the directors of the Defiance Machine Works, Defiance, Ohio, recently the following officers were elected: President, Peter Kettenring; Secretary, W. R. Strickland; Treasurer and

## Harmony Begets Success

On January 27th the Atkins Pioneers held their third annual banquet. The Atkins Pioneers are composed of artisans who have been associated with E. C. Atkins & Co. This banquet was the sixth anniversary of the organization. When it is considered that from an entire pay roll of one hundred and seventy-six in the year 1886 this organization now has a membership of one hundred and twenty-two, it will be realized that there is a harmony in the Atkins fold and that harmony begets success. The oldest member is now enjoying a pension, having retired from active service in 1909. His record shows continuous employment for the past forty-five years. There are three members with a record of over forty years.

The Garlock Packing Co., Hamilton, Ont., have issued a very complete and attractive catalogue of their packings and pipe coverings. The catalogue is handsomely bound in green paper with an attractive embossed design and title. The illustrations are numerous and excellent and the information contained in the book will be of much value to all who make use of this class of materials. Garlock's Packings are highly appreciated by the trade, and this attractive catalogue is certain to bring additional business to the company.

The Robb Engineering Co. Ltd., have recently sold a 40-h.p. saw mill outfit to Hugh & Ronald McDonald, Big Marsh, N.S., and a 35-h.p. saw mill outfit to J. W. & Frank McKenzie, Upper North River, N.S.

## An Excellent Financial Statement

The financial statement of the Lumber Mutual Fire Insurance Company of Boston, Mass., for the year ending Dec. 31, 1911, shows a net cash surplus of \$471,987.92. The losses during 1911 amounted to \$129,990.03. Dividends to policy holders totalled \$146,016.94. The net cash surplus showed a gain of \$58,857.29. The payments to policy holders from 1895 to 1911 inclusive amount to \$893,087.89 and the total dividends paid during the same period amount to \$799,166.03.

Following on the recommendation of the Conservation Commission the Dominion Government will set aside \$110,000 to be expended this year on the new Rocky Mountain forest reserve.

# WANTED & FOR SALE DEPARTMENT

## PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word, net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

## WANTED—LUMBER, ETC.

WANTED—5 x 5 White Maple, second growth, dry, 5 to 10 years old, for bowling pins. Address, M. J. Bernhard, 712 to 720 Jefferson Street, Buffalo, N. Y. 1-4

## Saw Logs Wanted

Red and White Pine, Hemlock and Spruce. Write in particulars of what you have. Reid Bros., Bothwell, Ont. 2-7

## Lumber Wanted

We are open to buy a few cars of firsts and seconds Rock Elm plank, 3 1/4 in. thick, 10, 12, and 15 ft. long. Quote prices. Box 436, Canada Lumberman, Toronto, Ont. 4

## White Pine Wanted

3 in. x 6-in-7-in. 18 ft. Tank Stock, also Quarter Cut White Pine Pump Squares. Ontario Wind Engine & Pump Co., Ltd. Toronto, Ont. t.f.

## Lumber Wanted

Large quantities of Soft Elm Lumber, 1-in. and grades No. 1 common and better. Especially attractive prices. J. S. FINDLAY, Owen Sound, Ont. 2-7

## Wanted

WANTED—Birch, maple and poplar logs, No. 1 butt cuts. Delivered Montreal from March to May, 1912. State sizes and lowest cash price to E. J. H., B34 Board of Trade, Montreal. 4-5

## Pulpwood

Wanted—to contract for 15,000 cords, or appreciable parts thereof, yearly for a term of years, of rossed spruce pulpwood for American shipment. Address Box 416, Canada Lumberman, Toronto, Ont. 3-4

## Pickets Wanted

We want at once and during 1912, 4/4 x 44 in. and 48 in.; 5/4 x 44 in. and 48 in.; 6/4 x 44 in. and 48 in. White Pine, Spruce, Basswood or Poplar Squares. Will buy a car or your entire output. Box 58, Ogdensburg, N.Y. 4-9

## Lumber Wanted

Will contract with a few hardwood mills for their entire cuts, 1912, including culls. Highest prices paid, and quick shipment. Also open for dry stock of all kinds. Also Spruce and Hemlock. Apply to Box 414, Canada Lumberman, Toronto. 2-5

## Spruce Wanted

We can use short Spruce 4/4-in. and 5/4-in. in 2/5-ft. and 6/11 ft. Describe what you have to offer, and give lowest price delivered here.

THE RATHBUN COMPANY, Deseronto, Ont. 3-8

Two-inch Soft Elm wanted, immediately, several cars, dry. State quality and prices. Great Lakes Lumber Company, Limited, Owen Sound, Ont. 1-4

We want to purchase a quantity of dry Maple, Elm, Basswood and Birch, and also contract for the present winter and coming spring cuts of Hardwood lumber. Address, The London Lumber Co., London, Ont. 4-7

WANTED—Hemlock or pine lumber in exchange for a five passenger fully equipped McLaughlin-Buick Automobile, thoroughly re-built and re-finished this winter and in good road condition. Price \$800. 4-5 Box 303, Oshawa, Ont.

We are in the market for the following White Ash:—  
100,000 ft. 1 1/2-in. (Dry size) plank.  
50,000 ft. 2 x 2 x 32 in. dry size.  
25,000 ft. 2 1/4 x 2 1/4 x 32 in. dry size.  
50,000 ft. 2 1/2 x 2 1/2 x 36 in. dry size.  
Reply, Box 438, Canada Lumberman, Toronto, Ont. 4-6

## Hardwood Wanted

3,000,000 feet Hard Maple, Soft Elm, Rock Elm, Beech, Birch, Basswood, Ash, Oak, and Soft Maple, for delivery, shipping dry during 1912. Sawed to our sizes. State what you have to offer and lowest prices for spot cash. Inspection at mill. Apply Manufacturer, Box 401, Canada Lumberman, Toronto, Ont. 1-8

## FOR SALE—LUMBER, ETC.

## For Sale

Two carloads White Oak Timber in round six to ten inches diameter small end. Eighteen to thirty feet long. ROBERT LIGHT, Napanee, Ont. 3-5

## Hardwood For Sale

We are prepared to cut under contract:—  
250 M. to 500 M. feet Hard Maple.  
100 M. to 200 M. feet Basswood.  
Also some Black Ash, Birch, Soft Elm. Correspondence invited. The Pearce Company, Limited, Marmora, Ont. 22—tf

## For Sale

The following Special Stock:—  
1,000,000 ft. Scant 2-in. Spruce Random.  
300,000 ft. 1-in. Spruce Mill Culls.  
50,000 ft. 6/4 and 8/4 White Pine Mill Culls.  
100,000 ft. 1-in. 6 to 9 ft. White Pine Shorts.  
100,000 ft. 1-in. Fourth Quality or Box White Pine.  
All dry and can be shipped promptly by rail.

THE A. SHERMAN LUMBER CO., Potsdam, N. Y. also 50 Church St., t.f. New York City.

## For Sale at Greatly Reduced Prices

400,000 M. ft. 1 x 4 and up by 6/16 ft. No. 2 Hemlock.  
75,000 M. ft. 1 x 8 and 10 x 6/16 No. 2 Hemlock.  
25,000 M. ft. 2 x 4 x 6/16 No. 2 Hemlock.  
25,000 M. ft. 2 x 6 x 6/16 No. 2 Hemlock.  
35,000 M. ft. 2 x 8 x 6/16 No. 2 Hemlock.  
25,000 M. ft. 2 x 10 x 6/16 No. 2 Hemlock.  
Must have room and will sell away below cost.

THE RATHBUN COMPANY, Deseronto, Ont. 2-4

## For Sale

1-in., 1 1/4-in., 1 1/2-in. and 2-in. mill cull White Pine in strips and sidings. Fred T. Smith, Board of Trade Building, Montreal. 1-t.f.

## Shingles

500,000 M. pieces Rathbun's XX-18-in. Cedar Shingles. To introduce this shingle to the trade, we are offering them for one-half their value. \$1.00 per M. pieces F.O.B. cars Deseronto. The Rathbun Company, Deseronto, Ont. 1-4

FOR SALE—18 M feet 7/8 x 2 1/2" and 3" wide Hardwood Flooring L. E. G. and Pressed Kiln Dried at \$20.00 per M. L.O.B. car.  
12 M. ft. 3" Dry Hard Maple No. 1 C & B 80%.  
1 ft. C 2nd at 35 per M. in L.O.B. car.  
For quick shipment address Box 442, Canada Lumberman, Toronto, Ont.

## White Pine Logs For Sale

On Magantawan River, about thirty miles from Georgian Bay, in Township of McKenzie, Parry Sound District, approximately 7 1/2 million feet. Early delivery to mill for sawing.

Will sell in one or more lots.  
Stock of superior quality.  
Eighty per cent. sixteen feet length.  
Ninety-five per cent. White Pine.  
Located for convenient inspection near Deer Lake Station on C. N. O. Railway, 23 miles north of town of Parry Sound.  
Further particulars upon request.

## HOLT TIMBER COMPANY.

926 Manhattan Building, Chicago, Ill.

## FOR SALE—MACHINERY, ETC.

## Machinery For Sale

A Waterous No. 4 Band Saw Mill, with Carriage Saws, Live Rolls, and complete Filing Room equipment, also several Good Woodworking Machines, in splendid condition.

J. S. FINDLAY, Owen Sound, Ont. 2-TF

## Relaying Rails For Sale

12 miles 56 and 60 lb. per yd. with fish plates.  
10 miles 80 lb. per yard with angle bars.  
4 miles 65 lb. per yard with fish plates.  
Also 12, 16, 20, 25 and 50 pound.  
New, light rails, all sections, in stock.

JNO. J. GARTSHORE, 58 Front St. W., Toronto. 5-6

## For Sale

One Gang Circular Sawing Machine (Kendall patent) good as new; run only 18 months. This machine carries nine 32-inch saws, takes from 4 to 10-inch cants, can be set to cut one to three inch stock.  
Reason for selling, cut out. For price, write Jas R. Gillies, Arnprior, Ont. 24-5

## Saw Mill Property For Sale

Saw Mill Property at Ford River, Michigan, consisting of three band saw mill, shingle mill, tie and post mill, lath mill, docks, and trams, blacksmith shop and machine shop all stocked with tools, large store and office building, large boarding house, large barns, sixty-three houses, lands, etc., all of which will be sold at a bargain. Apply to The I. Stephenson Company, Wells, Delta Company, Mich. 3-6

Going out of Lumber Business:  
1—24-in. Timber Planer.  
1—15-in. Heavy McGregor & Gourlay Match-er.  
2—12-in. Cowan Stickers, New.  
1—40-in. Cowan Band Saw, with Re-saw attachment.  
1—Self-Feed Rip Saw.  
1—26-in. Cowan Double Surfer.  
1—Pipe Bender.  
1—Rope Drive Equipment Complete.  
Dry Kiln Trucks.  
6—Lumber Waggon; single.  
1—Lumber Lorry; team.  
22—Lumber Trucks.

Carpenter Benches, Knives, Etc.  
Send your inquiries for the above or other requirements; we may have it. Apply, The Gold Medal Furniture Mfg. Co., Limited. 6

## For Sale

Good boiler, 72 inches by 14 feet, 72 4-in. tubes, 75 h.p. engine and 100 light dynamo. All in good condition and ready for immediate delivery. Will accept lumber in exchange. Apply to Box 400, Canada Lumberman, Toronto, Ont. 1-4

FOR SALE—Sawmill, in good condition, on Burford Lake, six miles from Warton, equipped with 70 H.P. boiler, 60 H.P. engine, new carriage by Long Bros., Orillia, good trimmers and endless chain attachment for hauling logs out of water.

Terms, etc., apply Massey-Harris Company, Toronto. 4-T.F.

## Rails For Sale

Thirteen miles 56 and 60 pounds per yard and fishplates.  
Ten miles 80 pound per yard and angle bars.  
Also 16, 20, 30, 40, 50's.  
New rail, all sections in stock.  
For particulars apply to J. J. Gartshore, Toronto. 4-6

Sawmill for sale, together with outfit, consisting of a 65 H.P. Ames Locomotive Type Boiler; a 50 H.P. Vim Engine, 12 x 15, in first-class condition; also a No. 1 Lane Sawmill; a Lane Pony three-saw Edger; Connell Lath Machine and Bolter, together with Butting Saws; also Pulleys, Shafting, Belting, and Tools. Will sell for cash or take payments in lumber. If interested address Box 433, Canada Lumberman, Toronto, Ont. 4-9

## Machinery For Sale

Carver, 4 spindle, Rohlman.  
Cut-off saw, railway, wood frame.

Wanted an alligator boat, in good condition. Reply, giving condition size, age, equipment, price and situation. Box 405, Canada Lumberman, Toronto, Ont. 2-5

## Machinery Wanted

Saw frame and Log Carriage, 60 to 70 ft. 12-in. Belt, preferably Rubber. 60 to 75 H.P. Engine, 80 H.P. Boiler. Must be in good condition and cheap for cash. One dust collector with a quantity of pipings 15-in. diameter. Box 435, Canada Lumberman. 4

## WANTED—EMPLOYMENT

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

Band Saw Filer wants position for coming season. Single or double cut. Twenty years experience. Address Box 413 Canada Lumberman, Toronto, Ont. 2-4

Architect and Surveyor, A.R.I., B.A. (25), requires post in spring. Thoroughly efficient. 22 Southborne Grove, Bournemouth, England. 3-4

Saw Filer wants position in saw mill or woodworking plant. Capable of keeping band and circular saw in perfect condition. Apply Box 403, Canada Lumberman, Toronto, Ont. 2-4

A.1. Band Filer, double or single. Gilt-edge reference. Reply Box 441, Canada Lumberman, Toronto, Ont. 4

Wanted a position as gang-filer; eighteen years experience. Address Geo. L. Nichols, c/o Canada Lumberman, Toronto, Ont. 2-4

As Band Saw Filer, double or single cuts, or in a factory where there are band saws. First-class references. Reply Box 422, Canada Lumberman, Toronto, Ont. 3-5

WANTED—Position as bookkeeper with lumber firm in Ontario. Twelve years' experience, mostly as office manager; age 34 years. Acquainted thoroughly with all departments of lumber office. Best of references furnished on application. Apply Box 399, Canada Lumberman, Toronto, Ont. 1-8

Position wanted with lumber company, planing mill or kindred institution by man who understands the business from tree to finished product. Years of experience as accountant, manager, etc. Could handle branch office or similar work and do it right. Toronto preferred, but any location considered. Box 439, Canada Lumberman, Toronto, Ont. 4-5F

## WANTED—EMPLOYEES

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

WANTED—Suitable parties to install and operate small sawmill on limit, New Ontario. Communicate with Box 437, Canada Lumberman, Toronto, Ont. 4-5

Millmen wanted, millwrights, edgermen, trimmerman, engineer, round saw filer. Lath mill men and lumber pilers. Mill will start as soon as ice clears in spring. Apply giving experience, etc., To Dymont Mickle Lumber Company, Whitney, Ont. 4-5

Wanted, a thoroughly competent Band Saw Mill man, to supervise the installation of new and old machinery in new mill and to continue on as superintendent of plant; permanent position for right man. Write direct. J. & W. Duncan, Limited, 1833 Ontario Street East, Montreal. 3-4

## BUSINESS OPPORTUNITIES

### Timber Limit For Sale

1,200 acres Hardwood, Hemlock and Cedar. Some Pine; 9 million feet for \$5,000 cash. Five miles from railroad; two from river. Box 431, Canada Lumberman. 3-4

### Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

### For Sale on Georgian Bay, Ontario

400 square miles of timber limits containing over 300,000,000 feet of pine, hemlock, spruce, cedar, basswood, birch, etc., and a vast quantity of the timber, also a sawmill with a capacity of 100,000 feet per 10 hrs. Price and terms very reasonable. Write for full particulars to E. Stewart, Forest Engineer, Room 11, 84 King Street East, Toronto, Ont.

### Planing Mill and Sash and Door Factory For Sale

Modern in every way, machinery, building, heating, dry-kilns, etc. Would consider proposition to run same from practical man who could take full charge and would invest some money as evidence of good faith and ability. Factory could be converted for use of other industry if wanted.

For complete description of plant apply Box 430, Canada Lumberman, Toronto, Ont. 3-TF

### For Sale

Mill and Plant situated on Bay Lake of Montreal River and within the town limit Town of Latchford on T. & N. O. Ry. Plant consists of one Boiler, 60 in. diam. by 14 ft. long, full flush front and rated at 70 h.p. Right Hand Engine, 12 in. x 16 in., estimated 64 h.p.

Three Moreau Machine Pulpwood Barkers and Pullup and all saws, shafting, belts, etc., including extras.

Siding of T. & N. O. Railway runs into mill yard; good storing point for logs. With very little extra cost, a circular saw and carriage could be installed as the power is sufficient. This plant has been in use about 10 months only and is in good condition. An excellent bargain for the right parties. Write or communicate with C. & H. D. Gamble, 28 Scott street, Toronto, Solicitors for Owners. 2-7

### For Sale

Established Lumber Business, with first-class mill, now running full time. Timber limits with 20 to 30 million feet of standing pine timber conveniently located, and all merchandise, etc. Price \$55,000. This is worthy of investigation. Address Box 332, Canada Lumberman, Toronto, Ont. 19-22-t.f.

### For Sale

170 ft. 1 in. good basswood short, 2 to 5 ft.  
11 M. ft. 1 1/4 in. good basswood short, 2 to 5 feet.  
14 M. ft. 2 in. good basswood short, 2 to 5 feet.

50 M. ft. 2 in. M. C. Ash.  
GEO. C. GOODFELLOW,  
Montreal, Que.

## Canadian Timber Limits

### E. STEWART (Forest Engineer)

Dealer in Timber Limits, Ontario and Western farm lands and town property. Excellent investments now open. Correspondence invited. 84 King Street East, Toronto. Phone Main 5609.

### Planing Mill, Saw Mill and Heading Mill For Sale

This is one of the best equipped Planing Mills west of Toronto, doing a prosperous business. Heading and Saw Mill in good condition; considerable timber to be had; will sell all or will sell Planing Mill separate. This is a going concern; no better proposition anywhere; a money maker. Will stand the strictest inspection. Can give satisfactory reason for selling. Reply to Box 417, Canada Lumberman, Toronto, Ont. t.f.

### Valuable Timber Property For Sale

The Oromocto Lumber Co., Ltd., ask for tenders for their property. (Tenders to close on or before 3rd day of April, 1912), and to be mailed to Mark Curry, Amherst, N.S., marked "Tenders for Property of the Oromocto Lumber Co., Ltd."

This property consists of about 74 square miles of New Brunswick Government land and about 5,783 acres of granted land, and about 30 acres of leasehold land, situated on the branches of the Oromocto River and estimated to contain sixty to seventy millions of logs, spruce, fir, pine and hardwood, and one hundred millions of pulp wood; property contains mill, five houses, barns, camp outfits, seven horses, rigging, etc.

The lumber cut off this property is available for shipment to either the United States or the English market as mill is on the line of the C. P. Railway, rate of freight to Boston points 14c.; St. John 3c.

This property is well situated to be operated cheap, and logs or sawn lumber produced at a low figure and is without doubt one of the best properties of its size in Eastern Canada.

Full particulars with regard to the property, etc., may be obtained from Mark Curry, Amherst, N.S.; Frank H. Lowe, Brooklyn, Queen's County, N.S.; William E. Golding, St. John, N.B., or the Oromocto Lumber Company, Ltd., Central Blissville, N. B. 3-6

### Belts and Their Laces

By H. Watson

Some of the commonest things around the shop have points that are worth studying if we would but give heed. There is no question that is so much discussed and yet has so many different sides to it as that of the proper way to lace a belt.

Personally, I do not like lacing at all; that is, rawhide lace leather. Still, there are some places where nothing else will hold, and we have to use it or do without. Then, the "boss" may have just this idea about it: one must use lacing or buy his own fastenings. But it was for me to find out that I did not know all there was to know about the commonest form of lacing in existence. I refer to the common "shoemaker" lace—a single row of holes on the end and a row behind it and just lace in and out, and stop the end any way you could.

That sort of lacing always gave way on me too badly, and I took

time to make the more complicated but stronger "double-hinge" lace. In making the single-hinge lace I had always started it like the double-hinge, entering from one side always on the hinge part. In the single-hinge this method always made the joint set a little crooked, even with great care in doing the work.

Having to patch up a lot of old belting, and all of it being punched for single-hinge lacing, I tried the experiment of lacing from one side on the first stitch and returning from the opposite to make a flat stitch, instead of a hinge for the first one. This held the ends of the joints square and prevented it from pushing one-sided, as it had always done for me. When the joint was completed I returned the lacing through the holes in and out across the one side, and crossed over and did the same on the other side, to protect the ends from wearing, and had a pretty decent-looking job. After a week of hard wear none of the joints showed any sign of letting go.

This form of lace is the easiest to make, and the quickest, and when made this way is as straight as any other and so simple that any of the hands around the mill can make it, once the belt is cut to the right length and punched for them; and in an emergency they can punch the holes, too.

I have not made any discovery for lots of others have been doing this same thing all the time, only I did not take the trouble to see how it was done in a proper way, and so I have let many an easy job get away from me because I was too prejudiced to take note of the proper way. Perhaps someone else is doing the same thing; that is why I mention it, as a hint to save them some of the lost time in making the double-hinge lacing. At the same time, if I had a driving belt or a heavy belt of any kind to lace, I would still use the double-hinge lace, and holes punched large enough so the fiber of the belt is not torn in drawing the lace through it.—Wood Craft.

The timber was then taken out and re-weighed, and various pieces were crosscut, all showing a remarkable penetration of oil, nearly to the center, which, it is claimed, is impossible in the old method except at great cost. One feature claimed for this process is the cleanliness of the wood, it being quite dry and clean to handle. It is likewise claimed that the cost of creosoting is much reduced by this method, waste of the preserving liquid being entirely avoided.

### Creosoting Wood Under Air Pressure

A new process of creosoting wood, claimed to be a great improvement over old methods, is

now being tested. At a recent demonstration, various shapes and kinds of wood were weighed and measured and then sealed up in a cylinder, where they were subjected to an air pressure of 50 pounds per square inch. The cylinder was filled with creosote, the air pressure still being maintained, and then the pressure was raised to 80 pounds per square inch, after which the pressure was released and the cylinder opened.

# Review of Current Trade Conditions

## Ontario

Most of the lumber at Ontario producing points is reported as having passed out of first hands although there is still a large percentage of it in the yards awaiting shipment. Stock still retained by manufacturers is held at high prices which are considered by the wholesale trade to be practically prohibitive. Many cases are reported in which the jobber is selling similar stock at from one to three dollars less than the manufacturer is asking for it. Shop and better and mill and dead culls are in good demand and stocks of these particular lines are somewhat low. There is thought to be danger at present, that the prices of mill and dead culls may be stimulated to a point at which users will look about for substitutes as they did in 1906. If this were to happen it would be certain to have a depressing effect upon the markets.

Georgian Bay operators report that mill culls have been practically all bought up. They also report that the demand for number 4 boards at Duluth has been active and that stocks have been all sold at prices which are \$1.50 to \$2.50 better than those of a year ago. Several large firms have disposed of their cut up to July 1st, a trade custom which prevails at the head of the Lake. North Carolina pine is reported to have advanced about \$3 a thousand during the last three months, a change which will be of considerable importance to the Ontario trade during the coming season.

## Eastern Canada

Montreal, unlike most other places in Canada has been enjoying a comparatively mild season and as a result building operations have continued to a slight extent. This has resulted in a fairly brisk local demand for lumber. January has seen a better trade than during the same month for several years back. Dealers are also expecting that the demand will keep up. Stocks are being held firmly and there is a tendency in certain lines for prices to stiffen. Among the hardwoods, chestnut, oak and birch are all in good demand. Wholesalers report a better trade than usual at this time of year.

Eastern spruce at Boston shows a slight tendency toward lower prices. Some of the mills are still holding out for former prices but others have made sales on a reduced basis. Some have accepted \$24 for frames but few manufacturers will sell at less than \$24.50. The yards have carried smaller stocks during the year to date than usual. An improvement is confidently expected with the opening of the spring trade. The demand for random has been rather more quiet of late than usual. Offerings of dry spruce boards are light and the market is rather firm. The demand for shingles at Boston is light, very few of the buyers having been inclined to increase their stocks. Manufacturers moreover are not particularly anxious to sell, as they look for an improved demand at better prices in the near future. Cedar extras are selling at from \$3.60 to \$3.65 and clears are bringing from \$3.25 to \$3.33. Lath are a little easier and the demand is quiet. Prices asked for 1½-inch range from \$3.90 to \$4, and for 1½-in. the price is \$3.50. Hemlock boards have been quiet at Buffalo recently. Offerings of dry boards are not large and prices therefore are about steady. Eastern clipped boards are selling at about \$20 and northern boards at about \$19.50.

At New York there are indications of an increased cargo trade in eastern spruce in the near future. Yards are ordering fair sized stocks in car shipments at present. The situation at the mills is strong and prices in all cases are steady. Hemlock prices at New York are firm but the demand is quiet, largely on account of the severe weather.

## Great Britain

A more hopeful feeling prevails in the London spot market than has been reported of late. Owners of stock are now securing some of the benefits which they counted upon from their last season's purchases as prices for spot goods are strong; a feature which is in marked contrast with selling at forward rates. Values are extremely firm and stocks are generally moderate. All of the Russian and Swedish ports are closed for the winter and stocks are therefore likely to dwindle considerably. Deliveries at the London docks during the week ending January 11th amounted to 5617 standards as compared with 4189 during the corresponding period of 1911. At Foy, Morgan & Company's recent auction sale, 3 x 6 Quebec spruce 9 to 12 sold at £7 15s. and £8 for fourths and 3 x 6, 7 to 13; fifths sold at £7 15s.. A parcel of 3 x 6, 12 x 13 ft. Quebec spruce seconds brought £9.

A few arrivals of spruce deals are reported at Liverpool from St. John and Halifax which have been sold on a basis of £8 9s. c.i.f. for St. John and at proportionate rates for Halifax shipments. Stocks are light and the consumption is steady. The demand at present is

confined principally to actual requirements. There is a scarcity of 2½ x 7 battens and they are bringing good prices. Wagon lengths are practically out of the market. 3 x 9 and 11-inch deals are not over plentiful and are strongly held by owners. There is not a very lively demand for imported boards. Stocks at present consist largely of 4 and 5-inch widths.

The market for birch at Liverpool is very firm and high prices are quoted for early shipments. Transactions up to date however have been few. Offerings of birch planks are light and are usually disposed of at good prices. The spot market is firm with a tendency towards higher prices as stocks to arrive are light and the consumption is fairly heavy.

At Manchester, the unfortunate trade disturbances had a very serious effect and the timber trade seems to have fallen into a morbid state. One frequently hears of holders disposing of their stock at cost. It is believed however that many of these will regret before long that they have disposed of their deals at present figures. Spruce is firm ex. stock and £9 2s. 6d. for 7 x 3-inch is obtained. A considerable parcel of 7 x 4-inch was offered at rather a low figure and was readily disposed of.

The timber trade at Glasgow is becoming fairly active once more, and good movements have occurred both from yards and from consignments recently landed at the quays. There seems to be a likelihood of a shortage of stocks before long. This, together with the probably increase in values resulting from high freight rates is resulting in a tendency on the part of merchants to increase their stocks. Hardwood stocks have been decreasing and will probably be pretty well exhausted before any new arrivals appear.

## United States

Unfavorable weather during the last month or more has been rather general throughout the United States but in spite of it the lumber trade has been fairly well up to the average. The number of enquiries and actual orders which have been received during the early part of February have been quite encouraging and would seem to indicate an active trade when the spring season opens. At Chicago, the receipts of lumber during the week ending January 27th amounted to 26,903,000 feet against 32,629,000 feet for the corresponding week in 1911.

Chicago—A renewal of activity is noticeable in the northern pine trade as the enquiries for spring supplies commence to come in. The general opinion prevails that the demand will be a little too strong for the available stocks. The high grades of northern pine are selling better than the coarse grades. There is a fair demand for shop lumber and better and also for pattern stock. Satisfaction is general in connection with the hardwood trade and conditions are considered very promising. There has been a continuing active demand for stocks from various industries since the beginning of last autumn. The demand for red oak continues the most important feature of the market. Dry stocks are scarce. Prices are steady. There is a fair supply of quartered white oak and prices are considered satisfactory. The demand for birch is increasing and prices are firm. A scarcity is noticed of rock and soft elm and the demand is active. There is a better enquiry for maple. The trade in hemlock has fallen off a little during the cold weather. It is generally believed that the spring trade will be active and that prices will be a little better than they are at present. Enquiries for southern pine are increasing and in frequent cases are resulting in orders. The strength in the demand for car material continues and the same applies to timber. Prices at present are firm and it is not considered improbable that before long they will advance slightly. The trade in shingles is rather quiet. Prices are quite unsatisfactory, clears selling at \$2.97 and stars at \$2.54, Chicago basis. White cedar shingles are steady in price but the demand is dull. Stocks of lath are light and prices are strong. The cooperage trade continues fairly firm but not much confidence is expressed in regard to the immediate future.

Buffalo—Building operations are light and accordingly there is not much demand for northern pine at present. The lower grades are however doing fairly well, and better prices are being secured. It is thought that the improvement will continue. Box manufacturers are looking for higher prices. An improvement is noticed in the hardwood trade at several of the yards. The lower grades in most hardwoods are firm with an improved demand, this applying to oak, maple, birch and chestnut. More frequent sales are reported of such woods as walnut, basswood and hickory. The quietness prevailing in the building trade has affected the demand for hemlock, but the market has a fairly good tone and the lull is considered as only temporary. Building operations this spring are expected to be extensive and dealers look for prices to continue firm, as stocks

E. C. BARRE, Ass't. Mgr.

are rather light. Prices of North Carolina pine are firm, as a result largely of the curtailed output caused by the severe weather at producing points. Several of the important grades are selling at better prices than they were a short time ago. The local demand is fair. Similar conditions apply to southern pine. The market for shingles and lath is quiet. When the weather moderates, a better demand is expected. Stocks are only moderate and prices are steady.

North Tonawanda—Northern pine dealers are looking for considerable improvement in trade conditions in the spring. An increase in the quality of business is looked for and better prices are expected as soon as the weather improves.

Bay City and Saginaw—The trade in northern pine is fair, considering the severity of the weather. Stocks of the lower grades of white pine are low and prices are firm. The movement of the upper grades of white pine is slow but not unusually so for this time of the year. Contracts are now being made with Georgian Bay operators for next season's delivery, but no reports have yet been made as to prices. It is not believed that there will be any reduction however in the prices for the higher grades. The continuing good demand indicates also that the lower grades will remain active and strong. This is accounted for largely by the improvement which has taken place in the box trade.

## Market Correspondence

### St. John Valley Trade Report

Fredericton, N.B., Feb. 6.—There is little if any change in prices asked for saw mill products in the local markets during the past month, and little demand at this season. The increased demand for lath and shingles in the United States markets has served to stimulate that industry here, and a number of small mills, especially on the upper St. John, are now engaged in their manufacture.

The Van Buren Lumber Company mill at Van Buren, Me., is now running eight shingle machines night and day, securing its stock from privately owned lands in New Brunswick.

The Fraser Lumber Company's mill at Plaster Rock, N.B., will re-open this month, sawing spruce, hauling their stock by rail to the mill from their lands lying along the National Transcontinental Railway, and they plan to get enough lumber in this way to keep their mill running until their drives are brought in.

It is expected that the transfer of the saw mills and extensive lumber lands of the Gibson Company, to the Consolidated Pulp & Paper Company, will be completed this month. This company have also purchased the Partington pulp mill at St. John.

Logging is progressing favorably, there being sufficient snow on the lower St. John to make good hauling, and not too much on the headwaters to interfere seriously with the work of moving logs. Though cutting is practically finished and several crews have browed their season's cut and moved out.

### Ottawa Valley Logging Operations Impeded

Ottawa, Feb. 12.—Lumbermen of the Ottawa Valley are unanimously grateful for the recent moderation of the winter weather. Never was a January so severe as this year's, within the memory of those who have kept account of such things for many years. From the first of January until after February had started, the mercury seldom stood as high as zero, while for most of the time the temperature was almost unendurable.

As a result of this protracted spell of unprecedentedly severe weather, the logging operations of the Ottawa Valley were very seriously restricted. The cold was unendurable, both for horses and men. For many days it was all the shantymen could do to keep themselves warm enough in their shacks, while work in the open was out of the question.

"Our operations have been very much restricted on account of this severe spell," reports Mr. C. Jackson Booth, manager of the Booth mills, the largest in Ontario. "It was as cold as fifty below zero in some places, and the severity was so continuous that it was hard on both men and horses. We had about four hundred of our teams ready for the logging operations, but they could do little for many days."

The question now being much discussed is, can the shantymen catch up, even with favorable weather for the balance of the winter? Upon this question there is some divergence of opinion. The early part of the winter, it will be recalled, was not satisfactory to lumbermen. Until well on in December the weather was too mild and open to allow the usual progress with the season's work to be made. For many weeks there were no roads fit for sleighing. For-

tunately a good snowfall obviated that difficulty, and a fairly cold spell would have suited everyone. But from one extreme to the other dropped the mercury, an unprecedented cold succeeding the mild forepart of winter.

"We are rushing things, now that the weather will permit," is the report of the more important lumber firms. Some think that the shantymen will be able to overtake the work they should have had done by now. Others are doubtful, but in any case the remainder of the winter must provide a good deal of favorable weather to allow the neglected logging to be fully done. One satisfactory feature is that the roads are in ideal condition.

In the local lumber situation there are no changes to report. These are off days with both buyers and sellers. The stocktaking of last year's business and the winding up of all the unfinished odds and ends combine to make this season a quiet one. Lumber merchants are chiefly concerned to see whether the thousands of shantymen in the Ottawa Valley have as good a winter showing to their credit as normally, for restricted logging of course means a restricted production in the coming season. The consensus of opinion is that the total cut of the year 1912 will exceed last year's, although the weather may still intervene to make that impossible.

Prices remain unchanged. The hopeful trend in the market noted at the beginning of the year is still in evidence. There is a general expectation of better trade with the United States than during the past unsettled season.

Some of the local companies are planning additions for next season's operations. The Gilmour and Hughson mills of Hull are being improved and somewhat increased in capacity.

### Encouraging Prospects at Montreal

Montreal, Feb. 10.—Although of course the volume of business passing is not very large, it is sufficient to encourage the belief that when building commences in earnest the demand will be on an extensive scale. Owing to the comparatively mild season construction has not wholly ceased and on this account local buying is more brisk than is usually the case in the winter. As one lumberman put it, "We have had a better January than for some years, and we look forward to a really good season."

Stocks are firmly held, and in certain lines it is difficult to pick up goods, while prices exhibit a tendency to move upwards. Common descriptions are in fairly good request and in hardwoods chestnut and oak are better. Birch is also being well bought. Wholesalers report there is no reason to complain, and that they are doing a fair trade, with inquiries more numerous than at this time last year.

The Lumber section of the Montreal Board of Trade has had under consideration certain charges made by the railway companies for switching and other services. The members of the section desire to secure the same privileges with respect to the shipment of car loads of lumber to Montreal as are now extended to grain shipments, namely, the right to bill cars to Outremont for orders to be forwarded to any other Montreal terminal without extra charge for the Montreal route. At present, grain merchants can ship their cars to the Outremont yard, just outside Montreal, to await orders for the grain to be delivered to any other city terminal, but in the case of lumber extra charges are made, and lumbermen feel that they are entitled to the same conditions as those under which the grain business is carried on.

Mr. Judson F. Clark, of Clark & Lyford, forest engineers, Vancouver, B.C., has been on a visit to Ottawa and Montreal. He has now returned to Vancouver.

At the annual meeting of the Montreal Lumber Company all the officers were re-elected.

### Activity Among New Brunswick Mills

A manufacturer in Carleton County, N.B., writing to the Canada Lumberman under date of January 30th, reports as follows: "This has been a quiet winter in the lumber business in this section. There was very little freezing during the month of December, consequently the brooks and low grounds were not favorable for 'yarding' very many logs. But the month of January has been cold enough to overcome the greater part of those difficulties, with the result that logging operations are now quite general, and while the amount of logs cut will not equal in volume the output of last year, yet a considerable quantity will be landed for manufacturing purposes. The prices being paid for logs at the different mills are about the same as last season, and the millmen are hopeful that market prices will be maintained, and a profitable season be insured them. This should be the case with the winter mills, as the expense of operating is necessarily greater in cold weather.

"Railway ties are in good demand at remunerative prices, and

## ECONOMY OF OPERATION

is ONE of the Essentials to be considered when comparing initial cost of a steam LOG LOADER

Sherbrooke - Montreal - St. Catharines - Cobalt - South Porcupine - Vancouver - Rossland

Works: Sherbrooke, Que., St. Catharines, Ont.

considerable activity is being displayed in certain sections, relative to the production of this important lumbering adjunct.

"J. A. Hayden's new steam mill has been running all winter, Mr. Hayden had a supply of about a million feet of logs on the banks of the Meduxnakeag River, that he is now manufacturing.

Messrs. Murchie & McElroy are getting in a good stock of logs, and will soon start sawing.

"Billings & Fleming of Debec, N.B., are getting in a pretty fair lot of logs, and have purchased considerable quantities yet to be landed. They are also laying in quite a lot of smaller material, to supply their stave and heading machinery, in anticipation of a greater demand for that class of goods in the near future.

"The Smith Lumber Co., Ltd., on the Meduxnakeag are as usual busily engaged in their lumbering operations.

"We believe the time is fast approaching when the hardwoods of New Brunswick will receive more attention, and will command a price in the outside market that will be remunerative to both manufacturer and dealer. There are considerable tracts of land covered with good quality hardwoods, and when these are properly advertised, and suitably equipped machinery placed to manufacture them to the best advantage, they will prove a source of revenue to the people of this province, that should be very gratifying from an industrial and financial standpoint."

### Activity Prevails in Restigouche Camps

During the past season the Restigouche Boom Co. of New Brunswick, received from the stream driving operations 110,000,000 feet of logs, which were distributed to the several lumber and shingle concerns at and near Campbellton and Dalhousie.

In addition to the logs floated down to the booms, a large quantity (amount not yet estimated) was brought in from the logging stations by the International Railroad, and the result is that more sawing was done in 1911 than in any preceding year.

There were increased shipments of laths, shingles, and pulp wood during 1911; but there was generally a dull market everywhere for boards and deals, of which larger stocks than usual are held over for future shipment. The total value of exports from this district to the United States in 1911 was \$994,660, an increase of \$28,632 over 1910.

It is estimated that the lumbering industries of Campbellton are employing fully 2,000 men at their logging camps this winter. Using that estimate as a basis of calculation, the whole number of men employed at the scenes of the logging operations throughout the district is not less than 15,000. At their winter camps they are as well provided with the best food supplies obtainable as any laborers anywhere. Mess pork, corned beef, frozen fresh fish, western dressed beef, fresh pork and mutton; potatoes, turnips, cabbage, carrots; tinned vegetables—tomatoes, peas, beans, and corn; condensed milk, soups, pickles, coffee, tea, sugar, Barbados molasses, etc., are principal items of their camp supply. They live well and comfortably, and their health and welfare are safeguarded as completely as possible. Few casualties or deaths occur among them while so employed.

### Splendid Logs Coming from North Shore Camps

Thessalon, Feb. 9th. The weather on the North Shore has been the very finest. The month of January was the coldest on record. Forty-eight below zero was registered, but it is the weather the lumberman wants for the woods. The logs are being hauled very fast and should the weather hold out as in the past month, the camps

will break up early in March. There will be some fine stocks of logs taken out this winter. Notable among these will be the Thessalon Lumber Company's logs and the Eddy Brothers and Company's logs. The Waldie Brothers have the finest stock of logs that ever came off the limits.

The writer was recently in Moore and McDonald's camps. The way the logs are being hauled there is astonishing. Twelve foot bunks, corner binds and hauling teams with 130 logs on a load are common every day occurrences. The logs are loaded with loading machines and no time is lost on the return of the teams to the woods where the loads are put on. The roads are all ice and you could go to the bank on skates. The horses go along with these great loads behind them as though they were not hauling anything.

At the present time a large number of engineers are surveying the Bruce Mines and Algoma Railway. Should this road be built, it will run through the finest timber in Algoma. Reports are current that some of the large lumber operators are interested in the project. If this is the case it ought to be a success. Algoma.

### Expects an Even Better Hardwood Year

Montreal, January 27th, 1912.

Editor Canada Lumberman:—

We found the season of 1911 a good one for hardwood, which constituted the greater part of our production, and prices we obtained for birch were better than 1910 prices. The prices we got for our other lots of hardwood, which were small, ruled about the same as in 1910.

We were unfortunate in losing our Calumet mill by fire in July, 1911. Our output at this mill was largely spruce, and this was entirely destroyed. The market for spruce, however, did not promise well. The prices we obtained for clapboards averaged pretty much the same during both years.

We expect an even better year for hardwood during 1912, and expect better prices for our shingles and clapboards.

Yours truly,

THE RIORDON PAPER COMPANY, LIMITED.

T. J. Stevenson, Manager of Sales.

### Steady Markets at Boston

Shephard & Morse, Boston, Mass., report under date of Feb. 6th as follows:—"We do not think there has been very much change in the price of lumber, unless it is on New Brunswick cedar shingles. Extras seem to be selling for \$3.60, and clears \$3.35. Second clears have not changed much. Red cedar shingles have been selling as low as \$3.40, and \$3.80 for the very best 16 in. We think Vermont spruce boards are worth \$22.50 to \$23, 1 x 2 Vermont furring \$19 to \$20, 1½-in. spruce laths \$4, and 1½-in. at \$3.50.

### B. C.'s Off Shore Lumber Trade

The British Columbia Mills Timber & Trading Company has issued a return of lumber shipped to off-shore points during 1911 and this shows that a total of 30,805,113 feet, valued at \$457,732, were shipped from Hastings mill during 1911 as compared with 34,677,385 feet, valued at \$472,200 shipped during 1910. The number of vessels loaded in 1911 was 21, as compared with 23 in 1910, and a noticeable feature is the few sailing ships. In 1910 out of the 23 vessels loaded 19 were sailing craft while in 1911 only seven were windjammers. Australia still continues to be British Columbia's best customer for lumber, as in preceding years, and last year she took 18,329,724 feet, nearly twice as much as in 1910. The United Kingdom and continent took 6,447,942 feet, which is an increase of over two million feet. The Fiji Islands ordered 2,521,670 feet, Japan and China 1,890,000 feet, South Africa 1,358,249 feet, Mexico 163,022 feet, and New Zealand 94,120 feet.

## EDGINGS

## Ontario

R. Truax & Son, Walkerville, Ont., are preparing plans for the erection of a planing mill during the spring.

A new paper and pulp mill is being projected at Thorold, Ont., which is to employ 150 men. Mr. James Battle is trustee for the company.

The sawmill belonging to Campbell and Pinkerton, Pinkerton, Ont., was recently destroyed by fire. A new and larger mill will be erected in the spring requiring complete new equipment.

The St. Mary's Wood Specialty Company, Limited, N. M. Currie, manager, St. Mary's, Ont., are in the market for a right hand sawmill, log jack, 60 to 75 h.p. engine, and an 80 h.p. boiler.

Canada Timber and Lands Limited, have been incorporated with a capital of \$250,000 to carry on business as lumbermen, to operate timber limits, saw mills, &c., with head office at Toronto, Ont. The incorporators are L. A. Hamilton, A. R. Davis and E. Stewart, all of Toronto.

The Arnprior Box Company Limited, has been incorporated with a capital of \$40,000 to manufacture and deal in wood pulp, fibre board, paper boxes and other wood pulp and paper products, the head office is to be at Arnprior and the provisional directors are G. F. Macnab, W. A. Whyte and Neil Campbell, all of Arnprior.

R. Lockhart & Company, Limited, have been incorporated with a capital of \$100,000 to carry on business as lumberers, timber merchants, saw and planing millers, timber growers, &c., with head office at Fort Frances, Ont. The Provisional directors are A. G. Seaman and W. F. Langworthy of Port Arthur and R. Lockhart of Fort Frances.

The Knight Manufacturing and Lumber Company Limited, has been incorporated with a capital of \$40,000 to carry on business as a general lumber company, dealers in stone, brick and other building supplies, &c., with head office at Meaford, Ont. The provisional directors are F. A. Knight, G. T. Knight, and Hugh C. Knight, all of Meaford.

The town of Parry Sound, Ont., will vote on February 18th upon a by-law to loan \$25,000 without interest to the Standard Chemical, Iron and Lumber Company, to grant them a bonus by way of gift of \$25,000, to convey to them a free site and to grant other concessions, in return for the erection and operation of a charcoal iron furnace plant in the town.

Representatives of the lumber trade waited upon Hon. W. J. Hanna and Dr. McCullough, Chief Health Officer for Ontario recently, with a request that in order to protect the lumbermen of the province from an epidemic of typhoid, which has been claiming many victims in the isolated sections, the Provincial Board of Health furnish the medical men who look after the lumber camps in Northern Ontario with typhoid vaccine. The delegation was promised that their recommendations should have full consideration.

The Dominion Government estimates for expenditures for the coming year include an outlay of \$200,000 for storage dams on the upper Ottawa River. These improvements are eagerly desired by lumber manufacturers and paper and pulp makers, both as a regulator of power supply, and as an assistance to the driving of logs. The conservation works on the upper Ottawa have been retarded owing to one of the contractors giving up the building of the Temiskaming Dam after he had undertaken it. The contractor reported that he had met with conditions beyond his control, and a settlement for the portion of the work completed is under negotiation with the government.

More amicable relations seem to be developing between the town of Fort Frances, Ont., and Mr. E. W. Backus, in connection with the proposal for the erection of a paper mill by the Ontario and Minnesota Power Company. An agreement has been reached that the company be permitted to expropriate certain land, if it cannot be purchased. Mr. Backus states that, if the town does not enter any objection to a bill for expropriating the land, the company will begin at once upon the erection of a 50-ton paper mill and will complete the erection of the pulp mill. He also asks that the town settle upon a flat rate of taxation for the company and that the embargo on putting in the grinders be raised.

Under the name of The Ontario Salvage Company a number of Ontario lumber merchants have made application for a charter permitting them to raise and offer for sale sunken and stray logs. The special sphere of operation of the company, the capitalization, or the directorate of which has not yet been disclosed, will be the Georgian Bay district, mainly in the line of the boom traffic from the upper end of the bay to Point au Baril. In case logs other than those owned by members of the company are raised, they will be returned to the company claiming them within thirty days of raising, provided that the ownership can be fully proved. The company in addition promises to keep the boat channels open and to remove stray logs from the usual steamer channels.

## Eastern Canada

Jos. A. Likely, Limited, St. John, N.B., have been incorporated to carry on business as lumber dealers.

The Smith Lumber Company, Woodstock, N.B., are reported to have dissolved partnership, Mr. A. W. Hay retiring.

The office of the Dalhousie Lumber Company, Dalhousie, N.B., was recently damaged by fire. The flames were confined to the upper storey.

It is reported that the Bathurst Lumber Company, Bathurst, N.B., have acquired the property of the Nepisiguit Lumber Company and will commence the construction of a pulp and paper mill.

The Board of Health of the Province of New Brunswick, at a meeting held recently at Fredericton, decided to ask the government to send an official

to enquire into the causes of the sudden and mysterious deaths of lumber jacks in some of the Miramichi camps.

Messrs. H. Elderkin & Company, Port Greville, N.S., report that they expect to build a woodworking factory this spring for the manufacture of hardwood spindles, broom handles, chair bottoms, etc.

The Dressing Lumber Company, Cedar Hall, Que., has been incorporated with a capital of \$10,000, to conduct a saw and shingle mill and general lumber business. The incorporators are: F. W. Ayer, Bangor, Maine; J. H. Adams, Metapedia; A. Leofred, Quebec; F. Lavallee, St. Jean Portjoli and others.

A Halifax despatch reports that the general store and lumber business of The Alfred Dickie Lumber Company, Limited, Lower Stewiacke, N.S., is advertised for sale, and also that the general store and lumber business of The Musquodoboit Lumber Company, Limited, Musquodoboit Harbor, N.S., is advertised for sale.

The planing mill of Shearer, Brown & Wills, Montreal, has been destroyed by fire. It was a four-storey structure, about 100 feet long and fifty feet wide, and contained a large quantity of lumber and machinery. The firemen succeeded in confining the flames to the sash and door factory, saving the dry kilns, molding sheds, stables, sawmill, power house and office building of the company.

A Montreal despatch states that, with a view to obviating the difficulty which the big publishing houses of the United States will experience in obtaining their supply of paper, when their present contracts with the Canadian manufacturers expire, it is reported that a \$30,000,000 merger of Canadian pulp and paper companies is in process of formation, backed by British and Canadian capitalists.

The South Shore Power & Paper Company, Ltd., has been incorporated with a capital stock of \$2,000,000 to carry on a lumber, timber and pulpwood business in all its branches and also to develop water powers, maintain and construct canals, reservoirs, docks, etc., the head office of the company to be in the city of Montreal. The incorporators include R. Chenevert, H. L. Mitchell and P. Gregory, all of Montreal.

### Western Canada

The Riverside Lumber Company, Calgary, Alberta, intend to erect a shed and stores, at Calgary, at a cost of about \$1,500.

The Colwell Lumber Company's office and yards at Zealandia, Sask., were recently destroyed by fire. The loss is estimated at \$25,000 and the insurance amounted to \$11,000.

The Okanagan Falls Lumber Company, Limited, has been incorporated with capital of \$25,000 to carry on business as general timber and lumber dealers, sawmill proprietors, etc., with head office at Okanagan Falls, B.C.

The Graham Island Coal and Timber Syndicate Limited, has secured an extra provincial license to carry on business in the province of British Columbia with head office for the province at 815 Bower Building, Vancouver.

The Brooks-McKenzie Lumber Company, Limited, have been incorporated with capital of \$25,000 to carry on business as sawmill proprietors, timber merchants and lumbermen in all its branches, with head office at Penticton, B.C.

A. A. Guy, 920 Eleventh Avenue West, Calgary, Alta, has applied for a permit to erect a sash and door factory to cost \$7,000. The building is to be two storeys, 54 x 80 feet, frame construction. About \$5,000 will be spent upon woodworking machinery.

Western Vancouver Lumber Company Limited, has been incorporated with a capital of £400,000 sterling to carry on business as lumber operators, timber merchants, loggers, saw mill proprietors, &c., with head office at Victoria, B.C. The incorporators are C. T. Dupont, G. H. Robertson, and A. E. Robertson, all of Victoria.

The Ritchie-Shelton Lumber Company has been incorporated with a capital of \$20,000 to operate mills for the manufacture of lumber, shingles and timber products, to deal in timber lands and to carry on a general lumber, timber and logging business in all its branches. The head office is at Vancouver, and A. M. Whiteside is solicitor.

The Hardwood Syndicate, Limited, has been incorporated in British Columbia with headquarters at Vancouver, with the following among its numerous privileges: "To acquire wholly or partly and from time to time the property and benefit of a hardwood concession in the Philippine Islands, and for the purpose aforesaid to fit out and finance an expedition or expeditions."

The City Council of Nelson, B.C., has passed an agreement with the Western Box and Shingle Mills, Ltd., which will open a large factory in a few weeks. The factory is fitted with the most modern machinery and will manufacture a thousand boxes and fifty thousand shingles per day at the commencement, with probability that the output will be largely increased. Over two and a half million feet of cedar logs will be used this summer, and special attention will be given to fruit boxes for the shipment of the Kootenay fruit crop.

### Trade Enquiries

The Dominion Government Trade and Commerce reports contain the following trade enquiries. Readers of the "Canada Lumberman" may obtain the names of enquirers by writing to the Department of Trade and Commerce and stating the number of the enquiry.

44. **Walnut wood.**—A Birmingham merchant is desirous of importing Canadian walnut wood.

54. **Process for utilizing sawdust.**—A Welsh firm interested in a process for utilizing sawdust are desirous of getting into touch with Canadian lumber manufacturers.

91. **Lumber.**—A large firm of commission merchants in Havana is anxious to correspond with Canadian exporters of lumber.

110. **Wood.**—A London firm having a demand for best three-ply pine or similar three-ply wood, asks for names of Canadian manufacturers.

133. **Planks.**—A Bristol firm would be glad to purchase parcels of hardwood planks from Halifax to Bristol.

## The Barnhart Log Loader

has been in successful operation in all parts of the country for twenty years and never caused a complaint. We are now manufacturing a new Barnhart Loader known as Model "12," which is specially designed for use in very heavy timber. This loader is built on the same lines as the old Barnhart Loader now known as Model "10" and which we still continue to manufacture. We are operating lumbermen, producing 200,000,000 feet of lumber per annum and we use the Barnhart Loader exclusively. Could we afford to do so if it were not the best? Write us for prices.

## JEFFREY DRAG CHAINS

FOR CONVEYERS

Designed for handling Saw Dust, Refuse, Shavings, etc. Made in malleable and steel.

Jeffrey Chains are made of very best material, perfectly welded and accurately pitched: thoroughly tested before shipment.

**Jeffrey Cable Wheels** are the only adjustable and flexible tooth wheels made. They relieve frictional wear on both the teeth and cable blocks, preventing blocks from binding on the teeth, insuring a smoothly running conveyer.

# THE ELIMINATION OF EXPANSION GEARING

## Plain Facts, No. 3

Speaking of a system of feed on a Planer and Matcher, our attention was recently called to a statement of a contemporary concerning his machine as follows, "In no case does a gear on our machine receive and transmit the power through the teeth *except in the case of expansion gears.*"

Please note the *exception* in the above quotation.

If you are familiar with the No. 77 Planer and Matcher, you know that there are *no* expansion gears in *its* construction.

Do you know the purpose of expansion gears? Of course you do. They are an *excuse* for not being able to drive the rolls direct; and, like all excuses, they are weak. True, they have to be used on some classes of tools, as for instance, a timber sizer; but they are out of place on a 200-ft.-per-minute-Planer and Matcher.

There is a very good reason why our system of feed on the No. 77 is not copied just now,—it's patented.

We have photographs of the feed on the No. 77 with the covers left off, exposing all the gearing. We will send you a set of these pictures if you are interested in this important fact concerning the feed of a High Speed Planer and Matcher.

*Write us direct or our sales-office nearest you.*

# DISSTON SAWS

ARE THE **STANDARD** BY WHICH

THE MERITS OF ALL OTHERS ARE

## JUDGED

A SAW TO BE SUPERIOR IN EVERY RESPECT must be made of a steel of such peculiar quality and texture that will "take" the hardening and tempering to the greatest degree, giving the highest temper, retaining the necessary toughness and elasticity which admits of the springing of the points of the teeth in the setting and at the same time being so hard that it will maintain the set and cutting edge the longest time. The blade must be ground an even thickness on the entire tooth edge, properly tapered to a thin back for clearance and the teeth of such shape as to enter into and cut—not tear—the wood.

**These are the Principles on which Disston Saws are Built**

Having over Fifty-six years' experience making steel in our own works, producing a material especially adapted for saws; employing the most skilled Workmen; using exclusively Disston processes of hardening, tempering and grinding, and with Seventy-one years' experience in the manufacturing of saws, during which time no efforts or expense were spared to achieve and maintain THE HIGHEST STANDARD OF QUALITY AND DESIGN, we are warranted in claiming.

**Disston Saws are Unequalled for Material, Workmanship and Efficiency**

**Disston Saws Run Easiest,  
Cut Fastest and Last Longest.**

## Makes It's Mark Vivid and Lasting

Marks that remain vivid and wear like iron are a real satisfaction to the man who handles lumber. The metallic pigments, like graphite, of DIXON'S LUMBER CRAYONS offer marvelous resistance to all kinds of weather conditions. Their marks are often visible after six months of severe exposure to sun and storms.

## DIXON'S LUMBER CRAYONS

have always remained the recognized standard because of their one, uniform and dependable quality; their convenient and uniform shape and size and because of the careful selection of materials used in their manufacture. DIXON'S LUMBER CRAYONS are made in nineteen grades and colors, including black (six grades), red (two grades), blue (two grades), green, white, yellow, brown, terra cotta, violet, pink and orange. Some are made to fill particular needs—let us tell you more about them. Get acquainted.

Write for lithographed booklet No. 239, illustrated in colors.

Joseph Dixon Crucible Company

## METROPOLITAN OIL CO.

Manufacturers High Grade Cylinder, Engine and Machine Oils and Mill Supplies, Etc.

## Mr. Saw-Mill or General Manufacturer:—

Are you willing to let us help you reduce the cost of lubricating your plant? If you are, we can do it, and believe this is a good time to call your attention to one of our Specialties. Lubricating Grease by our system has put many an extra dollar in the pockets of others, it will do so for you if you give us a chance, and you will be the gainer by the scheme.

Our Famous Lubricating Grease is a product that by common consent is admitted to save 50 per cent. in cost of Lubrication; fully 75 per cent. in cost of application. Continuous Lubrication, Economy, and Safety from Overheated Journals are the results of its use.

A post-card will bring Metropolitan Oil Company's samples and prices, or better still our representative, who will give you his advice, and expert services.

Can be used on any Circular Saw Mandrel

For cutting any width groove from 1/8" to 2" wide. Will cut either with or across the grain (Sent on approval).

**ROCHESTER, N. Y.**

## Forest Maps

The mapping of timber lands is recognized as a most important piece of work by Pulp Companies and timber land owners, in the economic handling of wild lands. We furnish topographic maps which show fifty-foot contours, or actual location of streams, ponds, lakes, roads, trails, and any other natural features of importance.

Accompanying this map is a so-called "Timber Map," showing in colors the distribution of timbers found. These maps, together with the detailed report and estimate, afford the owner of lands an intelligent system for the handling of same.

La Compagnie de Pulpes de Chicoutimi  
Chicoutimi, P.Q., Canada,  
August 23rd, 1911.

Gentlemen:—

Replying to your favor of August 11th, would say that we have no objection whatever to your using the name of this company with reference to the quality of your work.

After a careful examination of the maps and reports which were the result of your work on the two hundred odd square miles in question, we take pleasure in complimenting you on their accuracy, neatness and generally satisfactory character.

With best wishes for your success in the future,

Yours very truly,

**GEORGE C. W. LOW,**  
Manager Woodlands Department  
Messrs. Appleton & Sewall,  
156 Fifth Avenue, New York.

We are **PRACTICAL FORESTERS**, make forest surveys, timber estimates, and abstracts, showing character and quantity of available timber, indicating the most approved methods of cutting each year, so that there shall be no unprofitable depletion, and appraise for present and future worth. Our Booklet F, "Applied Forestry," will be of interest to you. Mailed upon request.

We are pleased to refer you to H. S. Ferguson, Engineer, 200 Fifth Avenue, New York City; Kathdin Pulp and Paper Company, Boston, Mass.; Bonne Terre Farming and Cattle Company, Bonne Terre, Mo.; Chicoutimi Pulp and Paper Company, Chicoutimi, P.Q., Canada.

**CARBORUNDUM COMPANY**  
NIAGARA FALLS, N. Y.

## Purchasers — And How To Locate Them

John Apsley Jenkins sells Hardwood trim. I met him yesterday, plodding along as though headed for the undertaker's. "Deucedly hard work digging up business—made nine calls to-day and not a dollar in sight" he confided.

Now, Jenkins is like nine out of every ten salesmen—spending their time making unproductive calls. They waste much time and good energy canvassing prospects that may want something, somewhere, sometime.

How can this waste effort be eliminated? How can knowledge of present and prospective markets be acquired quickly, efficiently, economically? How can this information be obtained, daily, from every town in Canada?

If you really want to know—drop us a line. Let us send you specimen reports relating to your business and explain our facilities for supplying you, daily, with information that will enable you to make sales.

# No. 156 Single Cylinder Smoothing Planer

Patented 10-10-05—10-23-06—12-4-06—3-28-11

The machine that stands for all that is best in the way of Single Cylinder Smoothing Planers—the machine you will eventually buy if you are interested in producing the highest class of work—at the lowest costs.

Just glance at the above engraving—have you ever seen a finer looking Surfacers?—it's built like a machine tool throughout. Notice particularly—there are no heavy weights, slow acting and cumbersome—in their place you find the Fay & Egan patented Spring Pressures—quick and positive in action, and furnishing an even pressure at all times, graduated according to the thickness of stock being worked.

A special Catalog of Single Cylinder Planers tells you a whole lot about the No. 156. Write for it and a sample of work done on the No. 156—The catalog and sample are free for the asking.

## INDUSTRIAL LOCOMOTIVES

Persistent specialization, careful testing of all materials and painstaking care in manufacturing have produced our standard locomotives for logging operations and switching around industrial plants.

These locomotives are the product of engineers and manufacturers who thoroughly understand conditions surrounding their use. These conditions require powerful and sturdy locomotives which will give maximum work for minimum attention. It is important that the boilers should be ample in capacity

and that they should be tight and remain so. Also that the machinery should be rugged for service with ample surfaces for wear. Parts that will wear should be accessible for easy renewal.

Our standard locomotives embody these features, combined with wide experience. To do yourself justice you should investigate them before purchasing.

Spare parts that are sure to fit are always on hand for prompt shipment.

Built in Two Sizes

These resaws are compactly built and are supported on the floor line so they do not need a special foundation.

Both upper and lower feed rolls are driven which gives a powerful and uniform feed.

We also manufacture Hopper Feed, Box Board Resaws and many other Hopper Feed Machines for box factories.

We solicit your inquiries.

U. S. A.

# Buy Guaranteed Chisel Tooth Saws

You need have no doubt about the quality when you buy

## SMITH'S CHISEL TOOTH SAWS

No. 2½ Tooth

**NO. 2½ TOOTH**—Designed for heavy feeds. Suitable for mills where independent steam feeds are employed, and also for edger saws.

**NO. 3**—Principally for hardwoods. The best saw where both soft and hard woods are to be cut.

**NO. 4**—Specially recommended for British Columbia, and for cutting soft, pitchy lumber where more throat room is required.

Smith's inserted and solid Tooth Saws are specified by the Largest Canadian Manufacturers of Mill Machinery.

They are backed by a guarantee as to their durability and will stand up better than any saw made. The shanks are made from a special steel, and we use only the GENUINE "HOE" BITS which are uniform and perfectly true.

Made in several sizes but the following are specially recommended.

No. 3 Tooth

**R. H. Smith Company Limited** St. Catharines, Ontario

# Interchangeable Cutter Heads!

**Y**OU wouldn't cross-cut lumber with a rip saw, nor smooth off a fine piece of work with coarse sandpaper. Neither should you expect to do all kinds of work with a single variety of Cutter Head. It don't pay, either in satisfaction or results.

The Shimer System of Interchangeable Cutter Heads, with each tool made for a specific purpose, presents the ideal equipment for any machine wood-working establishment. Flooring Heads can be removed from the spindles and Double Ceiling, or Ship Lap, or Jointer Heads, etc., can be substituted in a few moments. No waiting to transform a "jack-of-all-trades" tool into an inferior Cutter Head. The experienced woodworker—the man who is after results, and gets them—gets his Heads made as he wants them and has them on hand ready for service, consequently he finishes a job while the other man is getting ready. The cost of the equipment is saved many times over in the course of a few months.

Shimer Cutter Heads stand the closest inspection. They are sold on the plan of letting the purchaser convince himself by actual tests in his own mill that they are all we claim for them.

This eliminates any risk on your part, so send us order to-day for any tools you can use.

The "Shimer Limited" Cutter Heads with Expansion, Figs. 627 and 628  
**FOR THE HIGH SPEED MATCHER**

These Heads have a chucking device which self-centers them on the spindle and grips firmly thereto when the device is drawn up, overcoming the objectionable set screw as a means of fastening the Head to the spindle. It is reliable and practically perfect in results.

The Bits carry a larger areal surface and the Bit chambers are of greater depth to compensate for the new acute angle given to the Bits for greater relief to the parts coming into contact with the lumber.

They are simple and strong throughout, have no delicate parts to break down or get out of order, and are safe and efficient tools for matching flooring, etc., at high speeds.

Price, net, for Flooring \$72.46 the set complete.

## MATCHER HEADS

Figs. 22 and 23 with concave bit seats, without Bits . . . . . \$24.31  
Figs. 202 and 203, with Expansion, \$2.60 extra, each Head having 4 bit seats.  
Bits for Ceiling, the set of 8 . . . . . 10.40  
Bits for Flooring, the set of 8 . . . . . 11.44  
Bits for 2 inch Plank, the set of 8 . . . . . 13.04

## SHIP LAP HEADS

Figs. 38 and 39, 4 bit seats to each Head, price net . . . . . \$22.85  
Additional bit seats and bolts, only 65 cents extra each.  
Bits for jointing, 4 . . . . . 5.20  
Bits for Rabbeting, 4 . . . . . 6.76

## JOINTER HEADS

Figs. 54 and 55, 4 bit seats each . . . . . \$20.80  
Additional bit seats with bolts, only 65 cents each.  
Jointer Bits, 1½ in. wide, each . . . . . 1.30  
Jointer Bits, 2 in. wide, each . . . . . 1.56

## DOUBLE CEILING HEADS

These tools double the capacity of a matcher in working ceiling.  
Price, 2 Heads with 4 bit seats, each . . \$24.30  
Price, Bits extra, 8 . . . . . 16.64

## DOOR HEADS

Fig. 82, solid flange . . . . . \$10.75  
Fig. 84, with Expansion . . . . . 13.35  
Bits to work 1 in. to 1½ Doors (4) . . 7.25

## DOOR COPE HEADS

Fig. 83, upper and lower copes to fit any tenoner (set 2 Heads) . . . . . \$12.90  
Bits extra, 4 . . . . . 5.72

## SASH HEADS

Fig. 86, solid flange . . . . . \$9.75  
Fig. 206, with Expansion . . . . . 12.35  
Bits extra to work 1 to 1½ in. Sash (2 Moulded Bits, \$4.30; 2 Rabbeting Bits, \$2.86) . . . . . 7.16

## Don't Burn Your Moulding

are made of the finest tool steel by experienced workmen. In design and construction they are superior to anything on the market. They cut well and retain their shape until worn out. Send us drawings or wood samples for estimates on special cutters. Many useful designs, with prices, are given in our catalogue.

Blackened edges so often found in hardwood Mouldings indicate the use of inferior tools, which friction and burn because of their failure to have proper clearance. The Shimer Reversible and Non-Reversible Cutters

## Interchangeable Matcher and Ship Lap Heads

A Cutter Head that is either a matcher or Ship-Lap Head, according to the kind of bits placed upon it. Each kind of bit has its seat on the head which thus does double duty. Works as well for Flooring as for Ship-Lap. A convenience and saving to the man who wishes one pair of heads to serve the purpose of two.

Price, set of two Heads complete with Matcher Bits, \$32.24; Ship-Lap Bits, extra, \$11.96.

## The Shimer Cutter Head for O. G. Batten and Siding

These heads are especially designed to work O. G. Batten or O. G. Siding, having three circular cutters in line of the cut, seated and firmly bolted to one side of the head flange.

We make them to suit any matcher or moulder. They turn out O. G. Battens as regularly as our matcher heads work tongue and groove flooring. Give measurements same as for flooring heads; or, if flooring heads are already in use on your machine, give their record numbers, and send a cross section of the batten—wood sample or drawing.

Price for each Cutter Head, without bits, \$9.75. O. G. Batten Bits to mould ¾ in. deep or less, net each \$2.08.

## The Shimer Cutter Head Jointing Machine

guarantees a more uniform action of the Cutters. With the use of files it joints the edge of the Bits to bring them within a common cutting radius, so that each knife edge does an equal share of the cutting. Its careful use will improve the quality of work done and enable the operator to increase machine feeds if desired. The machine is also made with tracking attachment for setting the Bits before jointing and it can be used as a filing stand for holding the Heads while being sharpened with a file. The stub is ground to exact size of matcher spindles and all parts are carefully tooled, making the machine a very useful adjunct to the planing mill.

Price, \$39.00. With Tracking Attachment, \$45.50. Extra Files, per dozen, \$2.34 net.

## Thin Steel Knives

made from our Bedee Brand of Steel, for planing and surfacing lumber, are recommended by users as the best that can be procured. This special self-hardening steel under out treatment is very dense in grain—strong and tenacious—well calculated to withstand the knots as well as the fibrous cross-grain which is characteristic of the lumber of some localities. They hold an edge from one to five days at a single sharpening, according to the class of lumber they are used upon.

We can furnish them in any length or thickness. Write us about your requirements.

---

**No. 300 Heavy Duty Inside Moulder**

The advantages of a Moulder and a Planer and Matcher are combined in the machine illustrated above. Ease and speed in adjustment are insured through special unique features, not contained in any other type of machine. The method of lubrication is perfect. The general construction is after the plan of the planer and matcher, having heavy sides connected by heavy girths which in combination with a series of platen plates form the bed.

**No. 300 Heavy Duty Inside Moulder**

The special features of this model machine include truing devices for top, bottom and side heads, which insure all knives doing an equal amount of work. Six speeds are furnished through friction feeds. Top rolls are made with pull-out shafts, and extra rolls are supplied, all interchangeable. Matcher frames swivel, ample expansion for all bars and chipbreakers. Made in two sizes 15 x 6 and 12 x 6

## 36" — 3 Saw Edger

We build edgers in the following sizes between frames : 32", 36", 42", 48", 54", 60", 66", 72", 84", 96".

A few points regarding our 36" edger worthy of consideration :

**FRAME** consists of one solid base, which supports three upright frames. Each frame is fitted with a mandrel bearing 7" long, lined with best babbitt.

**ARBOR** is  $2\frac{1}{2}$ " in diameter and made from best machine steel.

**SAWS** Standard machine is fitted for three saws, one stationary and two moveable.

**SAW SHIFTER** We use a combination steel collar shifter and saw guide.

**END BEARING** can easily be removed by loosening two cap screws which allows saw to slip off end of mandrel.

# For Service and Results

One Customer Writes—

*"I have cut over 20,000,000 feet this last season and with your 'New Model' Bandmill have not broken or cracked a saw."*

It is not a question of what a Bandmill is worth per pound but what kind of mill will give the greatest service and the best results per dollar of cost.

## WATEROUS 'New Model' BAND MILLS

are built and sold on a basis of quality—exceptional cutting capacity, extreme accuracy and permanent satisfaction to the user.

Placed on the market in the fall of 1909 these mills represent the last word in modern Bandmill design.

Built strong enough to stand the heaviest work without vibration, so simple in design and with operating parts so well protected that they require practically no attention. Waterous 'New Model' Bandmills are fitted with a self-cushioning straining device and with improved and simplified saw guides that permit a speed and accuracy of cut unsurpassed by any mill on the market.

We build these mills as single or double cutters, in 8 ft., 9 ft. and 10 ft. sizes.

Over 30 have been sold in the last two years.

Numerous re-orders after one season's use and enthusiastic recommendations from those installations testify to their superiority.

# *The Logical Time to buy Lumber Is Before the Prices Advance*

---

One feature that appeals to us as being most essential in a business such as ours is "Uniformity of Grade."

When you give us your order, you can rely upon it that it will reach you with the quality varying in the smallest possible degree.

We make this feature a foundation stone in our commercial policy. Remember this next time you have occasion to order lumber of any nature.

---

Lumber this year is not plentiful. In our own district, the supply falls short of last year's by about fifty million feet.

Yet the consumption during the past two months has been truly phenomenal for this time of the year.

## **Quebec Spruce**

The grade you want, and the grade we insist on supplying—is bound to increase in cost.

At present we can fill orders promptly with choice mill run stock; 1" x 4"; 1" x 5"; 1" x 6"; in full or mixed car-load lots; rough dressed or re-sawed, as desired.

**WHITE PINE** (well-watered) Factory stock in 1"; 1 1/4"; 1 1/2" and 2" strips, shorts and sidings. Let us know your requirements at once.

## Rush Orders for Pine Doors

**No. 3 Pine Doors** are now our specialty.

Our recently doubled plant enables us to  
handle all kinds of rush orders to perfection.

We supply first-class, thoroughly well made  
**No. 3 Pine Doors** and guarantee them.

We handle this line ourselves from the  
forest to the dealers—from the logs which we  
cut in our own sawmills to the final shipment  
from our own factory to the dealer.

We can therefore quote you the lowest  
prices and give prompt shipments.

Let us quote you your next order for  
**No. 3 Doors.**

THE

**Pembroke Lumber Co.**  
Pembroke, Ontario

## Get Busy, Mr. Dealer

Don't sit with your hands  
folded while your competitor  
down the street is moving  
his stock out quickly.

Handle a line of lumber that  
sells well, prevents com-  
plaints, is up to grade and  
always satisfies your custo-  
mers.

We aim to produce the high-  
est quality of lumber at the  
lowest possible cost. Our  
workmen are skilled, are  
under our personal super-  
vision, and as a result, every  
stick of lumber turned out is  
strictly up to grade and pro-  
duced at a minimum cost.

Dealers who handle our lumber  
always come back for more.  
Have you tried a car yet?  
If not, get busy. Quick  
shipments our specialty.

When you buy these goods you get our 30 years manufacturing experience.

A handsome Illustrated Catalogue is yours for the Asking

In three sizes, 36, 42, and 48 inches long.

**Butterworth Foundry, Limited** Ottawa, Canada.

## Go and see the new BERLIN fast-feed matcher in operation

The mill is the laboratory in which the durability of a matcher is shown. A year's run will disclose more weaknesses and show the need of mechanical efficiency more clearly than any testing out the manufacturer could give.

And the great improvements made in the wood-working field today are due to our initiative in the direction of fast-feed machines.

### Pioneering

When we brought out the first fast-feed matcher ever built, a howl of skepticism rose up.

Competitors scoffed, and most lumbermen didn't believe a word of our advertising.

We told then as we tell today, the absolute truth in our announcements.

The first fast-feed matcher was the "94." It produced a better quality of work than other machines and at double the rates of feed.

Yet the "94" as compared with the latest Berlins is like the automobile of today and that of several years ago.

It paid its way. The hundreds and hundreds installed were gilt-edged investments. Yet we have been blamed because the "94" wasn't developed twice as fast as anything else in the machinery world.

### Further developments

After we had proven that a hundred foot feed was practical, the other makers of wood-working machinery clambered into the race.

Patents don't always protect and it didn't protect us then or now. If you notice mech-

anical construction you will find our improvements being adapted regularly.

Take the Berlin round cylinder head for example. In the first one we built, the screw which held the gib in place against the knife, passed through a portion of the head itself.

The principle was wrong. We replaced every head we had out. Yet that same style of head is being sold you today on other machines.

The Berlin cylinder head of today is the only durable head offered the buyer. It can't wear out. It's almost one solid piece. Ask any user.

Go and see one of the latest Berlin matchers in operation. And look carefully at the head construction. Compare it with others.

### Testing side heads

We soon found out that fine cylinder work must also be followed by equal side-head production.

A new head department was organized. Our pin type twelve bitted matcher heads were developed. The expansion feature was invented.

Today we have the only complete line of fast-feed side-heads in the world. There's the special ship-lap heads, matching heads, double tongue and groove heads—a complete line.

If you are unfamiliar with the completeness of our side-head line, let us send you a copy of a new booklet, 48-page, "Berlin Heads and Specialties."

Let us mail it to you. It tells the reason for the quality of our side-head work.

### The feed drive

From thirty gears, we have descended to almost none. On the latest Berlin fast-feed matcher there is but five.

Our frictionless chain drive is by far the most successful matcher feed works drive today. Its life is as yet unknown.

The Diamond chain runs smoothly and without perceptible wear. We used the chain drive on our No. 108 Moulders for the last eight years. We have never replaced a chain.

Competitors say "it will wear out." We leave it to your judgment. Certainly, it will stand ten times the strain we put it to.

Fire engines, motor trucks, of 60 H. P. and better, racing cars of 200 H.P. use the Diamond Drive and it is used for heavy duty.

The chain drive does away with all complications. Shavings don't stick. And we'll guarantee the wear. That's the last thing we think of.

### The result

The result of our years of experience in the fast-feed field is shown by the volume of our business.

We have created and put out more improvements than all other makers combined. Our line is high-grade and medium priced.

The results show in our latest machines. Go and see them in operation. Notice the profiling attachments and its simplicity.

Be sure and notice our line of heads. Go and see a machine. Ask us where you can see one running.

# Lumber Camp Ranges and Heaters

Our stoves are specially designed to meet all requirements of camp work.

We know exactly what is necessary and desirable in this class of stove.

We put into all our stoves the best of material and workmanship coupled with the best of expert experience.

The 'Leader Range' for coal and wood, shown in this cut is specially adapted to Lumberman Camps, Boarding Houses, Hotels and Railroad Construction Camp Work. We also make this Range with side hinge doors.

It is large, heavy and strongly built. Has good oven space and large heating surface. When a good, solid, reliable stove is wanted the 'Leader' will give satisfaction.

Write for our catalogue.

# Penatang Shoepacks

## GENDRON PENATANG SHOEPACK MFG. CO.

Sole Manufacturers, Penetanguishene, Ont.

LUMBER KING, SAMPLE No. 11

We keep busy all the year around, always have a good stock of packs for immediate shipment, and we attend to all orders promptly.

TEMISCAMING, SAMPLE No. 10

Our factory is the largest and most up-to-date in Canada, and is equipped with all modern upper-fitting machines and sole leather cutting machines, but **all our work is done entirely by hand.**

SANDY, SAMPLE No. 5X

We make every line of packs for every kind of work. Every pair is under special supervision before packing. Every pair packed with greatest care.

Our Surveyors, Explorers and Railroaders' Boots are special features and have made the **GENDRON PENATANG** famous.

Catalogue sent on request.

A trial order will put you **WISE.**

We have made Draw-string **SHOEPACKS** only, for over **FORTY YEARS**, other pack makers are only learning how. Ours is **the only properly made Draw-String shoepack in Canada to-day.** Made of our own specially tanned leather. A glance at our packs will tell you that

they are in a class by themselves. Anybody who has ever tried them will positively have no other but the **PENATANG** Packs.

NIPISSING, SAMPLE No. 21

CRUISING, SAMPLE No. 20

We put counter (sole-leather) stiffeners in every pair, so that the heel cannot come down.

SPORTING, SAMPLE No. 5

Our catalogues just off the press give you every detail, cut and price.

MANITOU, SAMPLE No. 13

## ACCIDENTS AVOIDED

**For Planers, Dynamos, Generators, Fan Work, Etc.**

A Few of the Lines We Manufacture

Make your power transmission an **asset** instead of a **liability**—a money-saver instead of a power-waster. Belt your machinery with

**GOODYEAR**  
**Imperial**  
**High-Speed, Friction-Surface**  
**BELTS**

"The Belt That Clings"

**Built the famous Goodyear way, for high-speed pulleys where great tensile strength is demanded**

The Imperial has the cling of rubber and the endurance of many plies of hard-twist, long-fibre **cotton fabric**, rubberized, cured and vulcanized into one solid, enduring piece.

## **Earns Cost—Costs Less**

The Imperial Belt is a power saver. It earns its cost by turning into increased production the power and the time lost by slippery leather belting. And it costs less.

## **Wears Longest Without Stretching**

Most economical because it wears longest.—First, because it doesn't slip. Secondly, because it is made by a process that abolishes **internal friction**. This soon wears the life out of the best leather belting and is caused by internal **grinding** as the belt bends and whizzes around small-high-speed pulleys.

Instead of a few plies of coarse fabric, we build up the Imperial with many plies of fine fabric. After the

**stretch has all been taken out**, rubber is forced through and all threads are separated from each other. Thus they can't rub and chew themselves, and the cause of internal friction is eliminated.

These belts are built to suit the purchaser. Let us quote prices on this most durable and economical high-speed, friction-surface, wear-resisting belting.

**We also make other rubber products—Tires, Hose for all purposes, Sheet Rubber Packing, etc. Throughout, you get the same high quality materials, skillful workmanship and years of experience that have built such famous service into products of the Goodyear Tire & Rubber Co., Akron, Ohio, U. S. A. In all our business in Canada last year, we had to replace because of slight defects only \$155.22 worth of goods. Write us at once.**

Canada, United States and Great Britain, \$2.00 per year in advance; other foreign countries embraced in the General Postal Union, \$3.00.  
 Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

## The Lumber Tariff Situation

In spite of the lengthy debate which took place in the House of Commons recently upon the lumber tariff, and the clearness with which it was then demonstrated that the lumber industry has been given the heavy end of the load in connection with the free importation of lumber which should pay a duty of twenty-five per cent. according to the tariff act; the situation as it stands to-day is far from satisfactory and continues to involve a great injustice to the lumber manufacturers of Canada. The act clearly states that lumber dressed on one side and jointed, tongued or grooved on one edge is liable to a duty of twenty-five per cent. Through the ingeniousness of the United States manufacturer, however, great quantities of lumber dressed on one side and jointed on the edge have been allowed to enter Canada free of duty. The Customs Board recently decided that the duty on this lumber should be enforced wherever there was any evidence to show that the lumber had been jointed on the edge, as well as dressed on the side. In other words, lumber dressed on one side and showing marks of the planer on the edge must pay the duty.

Why should there be so much consideration of the United States manufacturer in this matter? He has conclusively shown that he can joint the lumber on the edge and then obliterate the marks of the planer. His great object is to get dimension lumber into Canada without paying duty. If he can succeed in this he can dispose of large quantities of lumber in Canada, which would otherwise disorganize the markets of the United States. We, in Canada, owe no debt to the lumber manufacturer across the border. He has injured our markets so continually and extensively, that we are justified in doing anything possible to put an end to his depredations, so long as no loss or injustice is involved to Canadian consumers of lumber. In the debate in the House of Commons it was proven beyond question that no such loss or injustice would occur, if the tariff act were

enforced according to the intentions of its framers. Clearly the act was drawn with the object of encouraging the manufacture of finished lumber in Canada. Just as clearly, under the new order of things, the intention of the act is evaded and the manufacture of finished lumber is encouraged, not in Canada, but in the United States. The government should have the courage of its convictions and should come out decidedly with a statement one way or the other. If the lumber industry is entitled to exist in Canada and to supply Canadians with what they require for their buildings the government should make it clear and definite that finished lumber is not to be imported without paying a duty, thereby giving the lumber industry the benefits which were intended for them when the act was framed.

Lumbermen were pleased to learn recently that the government took their view of the matter to some extent, when they adopted the ruling of the Customs Board to the effect that if the planer marks could be discovered upon the edge of lumber which had also been dressed on one side it should pay a duty. They were pleased also when a few instances occurred, in which lumber of this class was made to pay the duty, even after it was known that much of the same class had escaped the payment. It looked as though the ruling would be enforced, as soon as the customs officials had become properly acquainted with their new duties. But there is a great element of doubt about the situation yet. If the customs officials must depend upon the discovery of planer marks on the edge of such lumber, in order to find it liable to duty, there is no question that enormous quantities will still escape their proper charge. It will be a matter of the greatest difficulty and expense to discover a few boards in the middle of a car load, which may bear the planer marks. In many cases the customs officials will probably not take the necessary care to find these marks. It is not a difficult matter to conceive that if the ruling is to be effective it may involve delays to traffic and the creation of much ill-feeling on the part of lumber importers.

Why should not the reasonable course be adopted at once and the whole difficulty straightened out before it leads to unprofitable trouble and ill-feeling? The intention of the act is simply to encourage the squaring up or further manufacturing of lumber in Canada after it has been imported in the rough. This being the case, the point which the government should consider is, not whether the planer marks are visible, but whether a given car load of lumber consists practically of stock which is of even widths and even thicknesses. No sane lumberman, whether manufacturer, wholesaler or retailer, would ever deny, that lumber of this nature had been "further manufactured" in the United States.

Unfortunately the question is one which provides a splendid field for political oratory and it is therefore likely to be left in its unsettled condition for some time, unless the lumber industry can make its weight felt at Ottawa sufficiently to convince the Opposition and the country, of the justice of their claim. Not until this has been accomplished can we expect to find those who are so loud in their illogical defence of the consumer to admit their mistake and to abandon their effort to make political capital out of the situation. The consumer is entitled to just as much consideration as anyone in this matter, but no more. In the past he has obtained far more consideration than he could justly claim. His interests are not endangered in any manner, not matter how much may be said to the contrary by his political friends. The question is one of simple justice and involves no disturbance to trade or unfair taxation of the consumer. Under these circumstances, the lumber manufacturers of Canada ought to continue without intermission in their campaign until they have obtained their object.

## The Indian As A Fire-Ranger

Archdeacon Rension of Moose Factory, Hudson Bay territory, made one of the most interesting suggestions which were put forward at the recent meeting of the Conservation Association, at Ottawa, when he appealed in favor of employing native Indians, as fire rangers. His reference to the subject was both picturesque and forcible. "A fire ranger," he said, "should be a man who is not

afraid of leaving the bank of a river, but the Forestry Branch of the Department of the Interior have been sending out men who did not know the difference between a frying pan and a paddle, or between a birch and a spruce. The time has come for the Canadian white man to get right with the Indians. We have in the North West hundreds and hundreds of Indians whom I consider an asset to the country. I hope the Dominion and the provinces will use the Indian in his natural environment. He is a good Canadian and would make a good official, not only as a fire ranger but as a game warden. Indians can do ten times the amount of work that is done by the same number of whites. The Indian is by no means an incubus upon the country. He is, in fact, a great asset to the country. The Indian is a post graduate in the school of Nature. I do hope that this country will do something to use the Indian in his own element. You cannot bring him in to breathe the dust-laden atmosphere of the city, which you, with your leather lungs can stand. His lungs are like gossamer. But get him in his own element in the forest and he can do ten times as much as the white man."

This is the opinion of a man who has lived in close communion with the Indians of the North West for many years and his views are entitled to consideration. The suggestion which he makes should be given careful study by the Forestry Branch and if it is found that there are enough skilful Indians to act as fire rangers, they should be appointed to replace the city-bred ranger, who in many cases is ignorant of the problems confronting him, in the forest. Something has already been done along these lines and the indications are that with Archdeacon Renison's commendation, their use will be extended. On the north end of Lake Winnipeg, arrangements have already been made to employ Indians on this work and their use will probably be extended by the Forestry Branch during the coming summer.

In the course of the discussion upon this subject another matter which has been attracting much attention of late, was brought up by Mr. Aubrey White, Deputy Minister of Lands, Forests and Mines, for the province of Ontario. A recent report stated that the department had decided in future to employ no more students as fire rangers, but to appoint only men who are experienced in woods life and who could be depended upon to do their work effectively. The department has often been criticised in the past for employing students upon this work for the summer months. Many students looked upon the appointment as an opportunity for a good summer holiday, at the expense of the country, involving little or no heavy work

or expense on their own part. They were frequently worse than useless as fire rangers, being ignorant of the work and incapable of conducting a vigorous fire-fighting campaign when necessary. The announcement that these men were not to be employed any more was received with approval by all interested in the preservation of the timber resources of the provinces. At the same time however, it was thought that the proposed change went a little too far, as there were, no doubt, students whose services were of great value, such for instance, as some of the students in the Faculty of Forestry, at the University of Toronto. These men are acquainted with woods problems and when they have had experience of bush life make splendid raw material for the development of an effective forest ranger. Mr. Aubrey White announced at the forestry meeting that there was no intention to exclude men of this class. The only object of the change was to make sure that the men employed are really capable fire rangers, instead of students in search of a summer jaunt. If the department succeeds in making a change of this nature it will go some distance in the direction of relieving the department of the stigma, which has attached to it in the past of having failed to measure up to its responsibilities in connection with the fire ranging problem.

It should not be thought however, that with the appointment of actually experienced men on a temporary basis, the fire ranging service will be as effective as it should be. The opinion is growing that there is only one solution of the problem, and that is, the employment of a force of fire rangers who are permanently responsible for the preservation of the forests from destruction, by fire. A man who enters the employment of the department in the spring and leaves it in the fall will not make as good a ranger as a man who knows that his employment will be continuous. A definite fire ranging force should be appointed consisting of experienced bush men who should be on the pay roll of the department throughout the year. During the winter time their pay might be merely nominal, as they would not be actively employed at fire ranging. They would probably go into the woods in the service of some of the lumber manufacturing companies. They would be however, at the call of the department all the time. Such men would form a service which could become invested with dignity and authority similar to that of the North West Mounted Police. After a force of this nature had been in existence for a few years their value to the country would be many times greater than any fire ranging body can possibly be under present conditions.

## Encouraging Progress of Forestry Movement

Several features of unusual interest stood out prominently among those which came up for discussion at the recent meeting of the Canadian Forestry Association, at Ottawa. Chief among them, were two which lie at the root of all forestry progress, namely; the encouraging increase in the interest taken by the public in the forestry movement and the equally suggestive co-operation which the forestry movement has secured from the lumber manufacturers of Canada. The education of the public to a real appreciation of the value of the forest resources of Canada was the first and most important step which the Forestry Association had to consider. It worked energetically from the first upon a definite plan of publicity which to-day has borne remarkable fruit. The public now has this matter in its mind as prominently as any other of the great features of the conservation problem.

From the support of the public flows the support of the government. At first the government felt obliged to go slowly in this matter. The growth of public sentiment however, has encouraged them to greater things and to-day the government of Canada stands upon the threshold of much greater accomplishments, in the direction of scientific forestry, than was thought to be possible a few years ago. Nothing was more encouraging to the members of the Forestry Association at their recent meeting, than the concurrence of both the Premier of Canada and the leader of the opposition, in their desire to impress the association with a sense of the approval

of both parties in Parliament, of the steps that have been taken to assist in the preservation of Canadian forests. Sir Wilfrid Laurier voiced this feature of the situation humorously but none the less forcibly when he remarked that he could remember no single measure which had been introduced by his government when in power and had not met with criticism from the opposition, with the exception of the measure for the creation of a forestry commission.

Since the first vote of money for forestry purposes was passed, only a few years ago comparatively speaking, each year has seen the amount increased. The work has been so encouraging and successful that the government of to-day feels warranted in going further still and it now appears that the time is not far distant, when sufficient money will be at the disposal of the forestry branch to prosecute its work in a manner fairly commensurate with its requirements. In this connection the government will no doubt be called upon soon to sanction the establishment of an experimental laboratory for the investigation of the properties of the various woods growing in Canada. Laboratories of this nature already exist in other countries and have proved of inestimable value. Canada needs them to-day, almost more than any other lumber producing country and the expenditure of money by the government for such a purpose would meet with approval from all classes.

The co-operation of the lumber manufacturers with the Forestry Association was a feature which stood out prominently at the con-

vention. The Canadian Lumbermen's Association had held its convention on the day previous and practically all its members remained over for two days, in order to attend the meetings of the Forestry Association and to be present at the combined banquet which was held on the first day of the forestry meeting. While they took no great part in the discussion or presentation of papers, the lumbermen were keenly interested in the proceedings and co-operated with the association in the passing of its numerous important resolutions. The lumberman of Canada has outlived the days when his attention was directed to the cutting and marketing of timber. He has been quick to realize the importance of scientific management of his timber possessions. He has readily seen the advantage of employing trained foresters to manage or to report upon his woods operations and he has, above everything else, studied with the minutest care the problems of the conversion of waste into by-product. In this latter direction probably, as much as in any other, has the conservation movement made important advances in recent years. Much remains to be accomplished still, and the work of the Forestry Association and of the lumber manufacturers is clearly mapped out along these lines. The experimental period of forestry in Canada seems to have passed and the hopeful era has clearly arrived. With determination and co-operation there is every reason to believe that our forest resources can be preserved for future generations as a natural resource of ever increasing value and that the fear of a timber famine in this country will be effectively removed. Determination and co-operation however, are essential even in greater measure to-day

than ever before. The public has read so much about forestry that there is a danger of its becoming imbued with a sense of unwarranted security.

Another feature of the forestry meeting which attracted great attention was the address by Mr. Gifford Pinchot, president of the United States Conservation Commission who told of the struggles which had been necessary in that country, in order to place the forestry service on an effective working basis. The burden of his remarks was the necessity for keeping politics out of the service. Coming at the formative period of the Canadian service, his lesson should be of great value to Canadians. Our forestry service has done excellent work. It has not been hampered by politics to anything like the extent that the service in the United States has. The great monopolistic interests have not developed the influence in this country, that they have across the border and have not been able to oppose the growth of the service effectively. But we cannot count upon everlasting immunity in this record. Our economic history is more than likely to develop along lines somewhat similar to that of the United States. If our forestry service can be placed upon an effective working basis and allowed to grow up without political consideration being permitted to interfere with its development, it will be in a position, if ever the day comes, to defend the interests of the people successfully against such concerted monopolistic movements, as have threatened the natural resources of the United States so continuously.

## Editorial Short Lengths for Busy Readers

When the latest tariff law was enacted by the United States Congress there was a provision repealing on August 1, 1911, the Pike Law, under which for many years free entry into the United States was granted upon the lumber product of sawlogs cut on the American side and floated down the St. John's River and manufactured in mills on the Canadian side by American capital, says the Lumberman's Review. This would hit such lumber manufacturing points as Fredericton and St. John, N.B., the latter, of course, being the most vitally affected for the mills in St. John, though having open to them both the markets of Great Britain and the United States, has as a rule shipped very heavily of its product from American logs into the United States. It is interesting to note that while the repeal of this law affected only the shippers from St. John during the latter half of 1911, the value of shipments from St. John to the United States was \$282,986, less than in 1910, and all information from this chief seat of New Brunswick indicates that the probable loss in business with the United States will be very materially increased during the shipping season of 1912, as the outlook for American demand upon the St. John mills is not particularly promising, if those mills are compelled to add the duty of \$1.25 per thousand to all of their rough lumber. American mills cutting spruce will bring fewer logs to the river landings this winter than last, but the new cut, when joined with the held-over logs of last season, will, it is believed, give the American mills a normal supply of logs for the 1912 sawing season.

The law passed by the government of Quebec nearly two years ago, which gave a year's notice after which the export of pulpwood cut from Crown lands in the province was to be prohibited in an unmanufactured state, is now receiving what is probably its first test and is proving effective. During the year preceding the enforcement of the act the export of pulp wood was the largest in the history of the province. Then there came a year of low water in the United States during which time the mills ran on reduced time. As a result they were not forced last year to draw to any great extent on pulp wood from Canada, their stock on hand being sufficient to keep them running. Now that their stocks on hand are practically exhausted they are forced to come into the Canadian market to purchase fresh supplies and they find that the price has advanced practically \$1 per cord, and are forced to pay from \$7.50 to \$8 for peeled wood cut on free lands. This extra dollar charged

for pulp wood will mean an additional dollar charged for their pulp and gives the Canadian pulp maker that much of an advantage. The indications are that the price of raw pulp wood will continue to increase from year to year owing to this scarcity, which will result in further advantages to the Canadian manufacturer, and eventually his absorption of the entire market. The Paper Trade Journal of New York referring to the situation says: "the real significance of the whole matter is found in the fact that this is the first real test of the working of the law, and it is proving itself to be an admirable and advantageous thing for the Canadian pulp and paper manufacturer."

The statements of Dominion Forestry officials that one-half of the original timber supply of Canada has been destroyed by fire; that moderate stumpage on what has been burned would have yielded a revenue of \$1,000,000,000; and that for every foot of lumber cut seven have been consumed, brings the old and baffling question of how to protect the forests once more before the attention of the Government and the public. When one considers the number of houses that could have been built with this timber, the implements and articles of furniture that it might have been used to manufacture, the imagination learns its own limitations. It is little wonder that the price of lumber has risen almost as rapidly and as high as the smoke of those disastrous conflagrations. A forest fire causes both direct and indirect damage. The timber burned is a total loss, and the difference between its value and that of its manufactured products also passes out of the country's estimated assets. The second growth never seems to have the heart to attain to its predecessor's splendor, and remains in stunted insignificance, a disfigurement to the country. In many cases, when a great fire sweeps over a district, the soil is burned off the underlying rock and agricultural prospects disappear with the timber. The problem of forest protection is so great that governments may be partially excused for skirting it up till the present time, but the growing scarcity of lumber is rendering it an acute issue which must be considered thoroughly. The recommendations of the Conservation Commission and the warnings of many practical lumbermen must force the hands of the Dominion Government, and it is not improbable that steps will be taken at the coming session of Parliament to extend and improve the fire ranging system.—Industrial Canada.

# Western Retailers' Annual Convention

Continued Growth and Expansion Reported—Heavy Imports from United States hurt Canadian Manufacturers—Insurance Company Prospering—W. W. Davidson the New President

The twenty-first annual session of the Western Retail Lumbermen's Association was held at Winnipeg on the 14th and 15th of February at the hall in the Travellers' Building. The convention was a most important one in many respects. It was the largest and most representative convention yet held and the different features were perhaps of a more interesting nature than at any previous meeting. The business sessions were all well attended and all branches of the trade were fully represented. W. W. Ireland, of Carberry (Man.), the president, presided. Addresses were delivered by E. N. Trowern, of Toronto, Dominion secretary of the Retailers' Association, and J. L. Campbell, also of Toronto, a former president of the Association. Important changes were made in the personnel of the executive heads.

The business of the first session held on Wednesday morning, consisted of the consideration of the reports of the president and secretary. The president extended a welcome to members of the association and the visitors. He felt that the association was be-

W. W. Ireland, Carberry, Man.,  
who presided at the Annual Convention

coming more and more a factor in the welfare of the lumber trade in western Canada. The past year had been a trying one for the lumbermen. The crop had not turned out as well as had been expected and had not been harvested satisfactorily. Owing to the condition of the United States lumber markets, the quantity of United States lumber brought in to the prairies had been very large. This was necessarily a disturbing element to the manufacturers. Fifty members had been added to the association during the year. The question of members who did not take an interest in the work was one of much importance. A proportion of such received the benefits of the association without giving any aid. He also spoke of the benefit of the district meetings, a number of which had been held. A special service department which had been inaugurated to take up questions of overcharges, delays in shipments and other matters of a like nature, had been a signal success. The inability of the railroads to handle the crop had had a most unfavorable effect upon the lumber business. The problem of transportation was of vital importance. At present, collections were very slow and difficult because of the inability of the railroads to move the crop.

## Report of the Secretary

The secretary, Alan M. Stewart, then delivered his report. He mentioned the fact that the association had come of age and said

that the members should thank those who in the past had given their assistance to carry on the work. There was a small deficit during the past year but they had cut down expenses by \$900. While the membership had increased something like fifty, the gain was not so great, as there had been a number of withdrawals for various reasons. The outstanding dues at present amounted to \$290. Because of the condition of the United States markets, large quantities of lumber from the other side of the line had been slaughtered in our markets. This had been hard on our manufacturers. It was believed that better conditions would prevail in the United States markets this season. The crops this year had been late. The railroad accommodation had not been nearly sufficient. The car shortage was a question which should be taken up vigorously. G. C. Ingram, representative of the association in Saskatchewan, had resigned, and J. Ernest McFee, of Moose Jaw, had been appointed to the position. He spoke of the success of his own department in inducing the manufacturers to discontinue hollow-backing of siding and ceiling, and also in inducing the manufacturers of sash, doors and mouldings, to follow a universal list, which he considered the most important step taken in years. Odd sizes and patterns were now cut out and many mistakes and delays would be saved in future. A. K. Godfrey, the ex-president, had organized a special service bureau which had worked out most satisfactorily. There had been sixty claims in connection with the transportation of lumber. Eight had been withdrawn, twenty-seven had been paid, and twenty-five were still pending. The service had been of great assistance in tracing cars. He referred to the fact that at many points in the two provinces there were too many lumber yards and regretted that there seemed to be a tendency to establish too many yards in the new territory. While he had no wish to eliminate competition, he believed that in many cases it would be better for some of the yards to withdraw as it was to the benefit of the consumer as well as the dealer to have business carried on under natural conditions.

J. Ernest McFee, representative of the association in Saskatchewan, then made a short report which he said was necessarily brief as he had been appointed only three months before and had not been able to get over his territory entirely.

Committees were then appointed to take up the reports. The minutes of last meeting were read. Some discussion arose as to whether the press should be admitted to the meetings. The consensus of opinion was that this should be done and it was stated that the impression was abroad that these meetings were held for the purpose of regulating prices. Under the circumstances it was deemed wise to admit representatives of the press or to have a report of the meetings supplied.

One of the most important features of the convention was the passing of a motion to amend the constitution. It was formerly necessary to elect the president from Manitoba and a vice-president from Saskatchewan. It was shown that the membership from Saskatchewan is 422, while in Manitoba there are but 164 members. The amendment provided that the president might be elected from the members of either province, in which case the vice-president would be elected from the other provinces.

The president, Mr. Ireland, stated that he felt the time had come when the election of a president from the west would be for the good of the association. C. A. Baker, of Moose Jaw, nominated W. W. Davidson, of the same place, and A. B. Estlin seconded the nomination. The vote was made unanimous. The new president is a member of the Davidson-Fraser Lumber Company, of Moose Jaw, and has been a director of the association for a number of years. He was not present at the session and W. W. Ireland presided at all the sessions. J. K. Robson, of Treherm was elected vice-president. This election was also unanimous.

Nine directors were elected from each province as follows: Saskatchewan—C. H. Wentz, Saskatoon; E. J. Mielicke, Dundurn; A. J. Ross, Salvador; J. E. Walker, Rocanville; N. Grest, Watrous; C. Campbell, Forget; F. J. Carpenter, Yorkton. Manitoba—D. E. Sprague, Winnipeg; G. E. Davidson, Manitou; D. E. Fraser, Kenton; W. W. Ireland, Carberry; A. B. Estlin, Melita; E. M. Williams, Russell; A. N. Shaw, Elm Creek; W. G. Macconnell, Winnipeg.

The feature of the Wednesday afternoon session was an address delivered by J. L. Campbell, of Toronto, on the subject of "Looking Two Ways." Mr. Campbell was formerly engaged in the retail lumber business in Manitoba. He was one of the promoters of the Western Retail Association and is a past president. His address dealt

Representative for Saskatchewan  
on Board of Directors

Mr. D. E. Sprague of Winnipeg, who opposed  
Tariff Increase

J. L. Campbell of Toronto,  
who delivered Address upon  
Prairie Progress

with the past history of the association and also with the future as it presents itself when looking forward from the present.

Mr. Campbell outlined first of all the history of the Western Retail Lumbermen's Association and its effect upon the lumber trade of the prairie provinces. Before the organization of the association the lumber trade had been unsatisfactory and badly disorganized. A change had come about when the association was formed and its gradual growth had continued until it included practically every wholesaler and retailer from Fort William to the coast. In later days, of course, the wholesalers had withdrawn and the association had developed upon purely retail lines.

Mr. Campbell next drew attention to the splendid work which had been done by a few individual members of the association. Prominent among these was Isaac Cockburn, the secretary of the association for a number of years, whose zeal and energy had been largely responsible for its success in the early days. Much assistance also had been given by representatives of the wholesale trade, especially by D. C. Cameron, the present Lieutenant-Governor of the Province of Manitoba. Mr. Cameron had given unstinted assistance to the association and had, in cases, even gone contrary to the welfare of his own company, in order to assist the growth of the association. Another prominent member was Mr. D. E. Sprague, who had always taken an important part in the work of the association and had frequently given valuable assistance. The present secretary of the association, Mr. Alan M. Stewart, was also men-

tioned in this connection, and Mr. Campbell spoke enthusiastically of his valuable services.

Dealing then with the lumber trade of the prairies, Mr. Campbell pointed out the great importance of the northwest, to the whole of Canada. In a few years they would have great voting power and financial wealth. The lumbermen of the northwest were an important factor in the business life of Canada and the members of the Western Retail Lumbermen's Association should continually bear in mind the important position which they occupied. Each retail lumberman was a power in his own locality and had great responsibilities to bear. It was incumbent upon him to set a high standard of business morality. The Western Retail Lumbermen's Association as a whole, therefore, had an urgent duty to perform in upholding a high standard of business ethics among the trade in general.

Mr. Campbell was tendered a hearty vote of thanks. He took a prominent part in the various discussions which arose during the convention. He was followed by J. K. Ross, of Salvador, who gave an interesting talk on banking and banking systems.

#### The Position of the Retailer as a Trade Factor

On Thursday afternoon, E. M. Trowern, of Toronto, Dominion secretary of the Retail Merchants' Association, addressed the convention on association work, particularly on the phases of it which are taken up by his association on behalf of the retailers of the Dominion, to the end that they may bring into existence more favor-

Mr. J. A. Thompson of Winnipeg, re-

for Manitoba on Board of Directors

able conditions by legislation and other means. He spoke of the unfairness of the present criminal code in its bearing upon the retail dealer and other branches of trade. He deplored the fact that they were not allowed to act in unison, and in an organized way to regulate prices and other phases of business, in order that business might be carried on upon lines which would give all engaged in wholesale and retail trade, and in manufacturing, an opportunity to make a reasonable profit. He declared that the press of the country should be and could be brought into line, provided dealers and manufacturers were organized as they should be, and he believed all that the press of the country needed was to be educated to see the problems of the business world from a business standpoint. He said that the government sold stamps under an agreed price, that the lawyers of the country combined to regulate their fees, but that the people in business were not allowed to do so. He told of the attempts which had been made to secure legislation to better conditions in this respect and of the prospects for the future in this connection. He asserted that it would be to the benefit of the association to affiliate with the eastern retail associations. The address was an eloquent and forceful one and was listened to with attention by the largest gathering of the convention.

D. E. Sprague, of Winnipeg, said that there was no doubt the Dominion Retail Merchants' Association had accomplished much. He referred to the policy of some of the larger manufacturing companies of the west in distributing lumber to the consumers of the prairies through their own yards. An attempt would probably be made to have the tariff revised to place greater restrictions on lumber coming into Canada from the United States. The association should see that this was not carried out. He believed that the policy should be to make the tariff less stringent rather than to make it more stringent. When the matter was brought to the attention of the government the influence of the western lumber dealer should be used to see that tariff conditions were made favorable rather than unfavorable to the bringing in of lumber. Mr. Sprague then asked if, in case the Retail Lumbermen's Association affiliated with the Dominion Association, the former would get the benefits of the results of the latter's work. Mr. Trowern answered in the affirmative, whereupon Mr. Sprague moved that the directors of the association be authorized to join the Dominion Association, if deemed advisable after consultation with Mr. Trowern. The motion was carried. Mr. Trowern met the directors the next day but the matter is still under discussion.

#### Financial Statement

The financial statement was submitted as follows:—

##### Receipts:

Dec. 31, To cash in hand	\$2,120.68
“ G. C. Ingram	100.00
“ rent	100.00
“ membership fees	680.00
“ annual dues, 1910	61.25
“ annual dues, 1911	5,057.50
“ Retail Lumbermen's Mutual Fire Insurance Company, Interest	240.00
“ Retail Lumbermen's Mutual Fire Insurance Company, proportion expenses	431.87
“ Retail Lumbermen's Mutual Fire Insurance Company, proportion salary	2,000.00
	<hr/>
	\$10,791.30

##### Expenditures:

Dec. 31, By travelling expenses	\$1,564.85
“ collection charges	17.25
“ postage and telegrams	249.60
“ printing and stationery	204.45

Retail Lumbermen's Mutual Fire Insurance Company.	\$6,000.00
Cash in bank	992.96
	<hr/>
	\$6,992.96

#### Insurance Company in Sound Position

The annual meeting of the Retail Lumbermen's Mutual Fire Insurance Company was held on the afternoon of the first day of the convention after the regular session. The meeting was presided over by J. B. Sinclair, vice-president, in the absence of the president, J. A. Thompson. Mr. Thompson's report was the first business taken up. It dealt with the work of the year in a general way. The com-

pany had had the largest amount of losses in its history but would be able to continue business at the same rate and with an increased surplus. The reserve was now large enough to meet any loss that might be sustained according to the basis upon which all ordinary risks were figured. It might be possible to reduce the rate but it would be wiser to continue at the same rate and increase the reserve, thus keeping the strength of the company on a basis beyond the possibility of a doubt. The reserve was all invested in first mortgages on land with principal and interest guaranteed. He mentioned the great benefits of the association, which had reduced the rates fifty per cent. and subsequently still more until at present the flat rate was 48 cents per hundred. The report of the secretary was on similar lines. Both reports were adopted. The officers were re-elected as follows: J. A. Thompson, president; J. B. Sinclair, vice-president; A. K. Godfrey, treasurer; A. M. Stewart, secretary; and directors: G. H. Wall, G. F. Robertson, F. McPherson, H. E. Mielicke, A. B. Estlin, A. W. Jones.

#### Banquet and Smoker

On the evening of Thursday, the 15th, a banquet and smoker was given in honor of the retailers by the manufacturers and wholesalers of lumber and sash and doors and the dealers in building paper. The banquet was held at the Royal Alexandra hotel and was the largest and most representative gathering of people engaged in various branches of the lumber business yet held in western Canada. Something over three hundred enjoyed a fine repast. Theodore Burrows, of Grandview, Manitoba, presided. The outstanding characteristic in connection with the gathering was the indication of the growing sentiment in all branches of the industry that the manufacturers, wholesalers and retailers should work together in greater unison than at present to overcome the main obstacles in the way of the prosperity of the trade. A number of speakers dwelt upon this theme. Among the speakers were the chairman, D. O. Anderson, E. Brooks, W. B. Tomlinson, G. H. Wall, G. W. Murray, J. L. Campbell, of Toronto, and E. N. Trowern, of Toronto.

E. D. Tennant brought up the subject of a proposed independent association in Canada, something on the lines of the order of Hoo-Hoo. It seemed that the controversy which had arisen in the United States in connection with the order made the future very doubtful and he suggested the name of Canadian Concatenated Order of Hoo-Hoo. A vote was taken and a large number voted in favor of starting the independent organization. No votes of a contrary nature were registered. Nothing more definite was done in this connection.

After the banquet a smoker was held. His Honor the Lieutenant-Governor, D. C. Cameron, was present at the smoker. Arrangements in connection with the banquet and smoker were made by Frank H. Mitchell, of Tomlinson & Mitchell; Ed. Tennant, W. Stubbs, George Hanbury, Sandy McDonald, R. F. Bingham and Mr. Clark, of the Lester W. David Company.

#### Uncertain Trade Conditions in the West

Mr. J. L. Campbell, of Campbell & Johnson, Traders Bank Building, Toronto, visited Winnipeg recently to attend the annual meeting of the Western Retail Lumbermen's Association. Upon his return to Toronto Mr. Campbell expressed himself to the "Canada Lumberman" in an interesting manner in regard to the business conditions prevailing in the prairie provinces.

In some parts of the country, he said, conditions at present were rather uncertain, on account of the car shortage. The movement of grain has been very slow and in some localities practically none of the grain has been shipped out. There is about 10,000,000 bushels which is damp and will be destroyed unless it can be shipped out before the heat gets into it. The outcome of the situation is doubtful. If a favorable spring occurs, about sixty per cent. of the grain may be saved, but if the spring is unfavorable it is thought that about sixty per cent. of it will be lost. These conditions are having a quieting effect upon business. Another evil influence is the subdivision fiend who is getting in some pretty fine work.

Many localities are feeling the pinch at present on account of the scarcity of money, caused by the farmers not having been able to dispose of their grain. The banks, moreover, are acting in a conservative manner and are not inclined to extend credits, especially if the applicant is hard up. The result is that the man who needs the money most is unable to get it. The same trouble is reported from all localities and seems to be accompanied by a movement of money from the small places to assist in the development of the larger ones.

Mr. Campbell believes that in all probability the lumber trade in Alberta and Saskatchewan outside of the towns, will be quiet during the first half of the year. So far as the farmers are concerned the outlook is not over bright. In Manitoba the trade will probably be larger than last year because crops in that province were better. The spring trade in Manitoba already gives better promise than that of a year ago.

## British Columbia's New Forest Bill

**Provincial Legislature Discusses it's Provisions—  
Situation Out-lined by Hon. Richard McBride**

The forest bill which was recently introduced in the British Columbia Legislature by Hon. Wm. Ross, Minister of Lands, has been made the subject of several long and interesting debates. After the bill had been severely criticized by several members of the Opposition Hon. Richard McBride delivered an interesting speech in support of the measure. He dwelt at some length with the difference between the conditions existing to-day and those which had been in existence in 1905, when the former bill was introduced. Under the former system the principle of administering the forests by means of licenses and leases was embodied in the bill, while the present bill introduces the principle of disposing of the timber of the province by means of auction sales. In 1905, he said, the province was only beginning to recover from a period of stagnation which had struck deep at the roots of many of the important industries of the country. Revenue was then urgently needed for the re-establishment of the provincial credit. During the past six years, however, the financial condition of the province had improved greatly. Under the provincial license system the province had retained the right to increase both the rental and the royalty charges so that the interest of the people in the timber increased as the value of the timber grew. Hon. Mr. McBride then dealt with the principle of granting perpetual licenses, claiming that it had enabled the license holders to secure loans from the banks. Under a limited period license the banks had refused to look upon timber property as a sound basis for a loan. In 1905, he claimed, it would have been folly to introduce the system of disposing of timber by auction. Such a course would, at that time, have resulted in a glut of the timber market and it would have been impossible for the Department of Lands to organize its staff quickly enough to handle the sales safely and profitably. The auction sale principle was a good one when small lots of timber were to be disposed of, at intervals, after expert valuation. As these were the conditions under which the government would be able to conduct future sales it now proposed to amalgamate the auction sale idea with the special system of licenses.

Referring to the present condition of the lumber industry in the province, Hon. Mr. McBride said that it was never on a sounder footing than to-day. Comparing the situation with that in the Pacific coast states it was seen that the mills across the Sound were either shut down or running half-time only, and payrolls were cut to the minimum, while the operators were glad to sell their output at a low margin, even at cost, and in many cases below cost, for immediate money. On the Canadian side, most of the mills were continuously at work, making excellent profits and distinctly prosperous, it being expected that 1912 would prove the banner year in connection with the industry in the province. New mills were being put up all the time and heavy investments made in them and in the general stimulation and extension of the industry.

### Forest Fire Causes Important Legal Action

An interesting and important legal action was commenced in the Supreme Court of British Columbia, at Nelson, B.C., on February 13th. The King Lumber Mills, Limited, located near Yahk, B.C., are the plaintiffs and their action is for damages estimated at \$140,000, alleged to have been caused to their timber limits by fire originating from the C. P. R. trains passing through the district. On the first day of the trial, three witnesses were examined, whose evidence was to the effect that the fire started in a stump along the railway right-of-way, and after burning slowly for a few days was fanned by a stiff wind, until it became a large forest fire. The C.P.R. are expected to claim in defence that the fire was started by ranchers, making use of the right-of-way as a road.

Dr. J. H. King, of Cranbrook, president of the King Lumber Mills, Limited, who was the first witness, stated that when travelling on the Crows' Nest line, at night time, he had observed sparks flying from C. P. R. locomotives. He admitted that ranchers between Yahk and Curzon made a practice of travelling over the railway track.

An experienced bush man from Wisconsin, who was in the employ of the King Lumber Mills, stated that on the afternoon of July 4th, 1910, he was walking along the track after one of the company's trains had passed and saw a fire about twenty-five feet from the track. The fire was in a stump and he also noticed some of the grass round about on fire. Later in the evening he returned and noticed that the fire was spreading slowly. It was burning also at 9 o'clock, as he passed by and he saw no one attempt to put it out. On the following day the fire had spread to an area of about 75 feet. On July 6th or 7th a section crew had tried to put the fire out for about three hours, but had not been successful, as the wind was against them. On July 8th the C. P. R. fire warden and some men

managed to stop the fire from going east. On July 9th the wind became very strong and the fire crossed the Moyie River. On July 10th the wind changed and drove the flames towards Curzon and farther into the King limits. By July 13th, it had extended about a mile south from the river.

The case is attracting much attention among timber owners in British Columbia, as its outcome will be of much importance to them all.

### Prairie Pulpwood Dutiable on Entering U. S.

The United States Government has learned of more Crown forest lands in Canada upon which restrictions are placed as to the manufacture of their timber, thereby depriving the wood pulp and print paper made from these woods of free entry into the United States. The lands are located in the Provinces of Manitoba, Saskatchewan and Alberta, within twenty miles on either side of the main line of the Canadian Pacific Railway in British Columbia, and in a tract of 3,500,000 acres in the Peace River district in British Columbia. Licenses on the lands provide that all timber cut from them must be manufactured in Canada. The Treasury Department has advised the collectors of customs, and the State Department advised the consular officials that this was a restriction which warranted the imposition of the tariff duty on the wood pulp and print paper made from these woods when entering the United States.

### A Permanent Forestry Exhibit for B. C.

A permanent forestry exhibit has been arranged for by the directors of the Vancouver Exhibition Association. W. J. Brandwith of the department of agriculture reported that he could arrange with lumber mills and loggers to construct a forestry exhibit at comparatively small cost and the value of this exhibit could scarcely be overestimated. It would demonstrate the timber resources of the province and the methods of manufacture and from all points of view would be a desirable acquisition for the exhibit could be arranged in most attractive shape. Mr. Brandwith was authorized to proceed with the arrangements.

## Personal News of Lumber Trade

Mr. Arthur H. Campbell, of the Campbell-MacLaurin Lumber Company, Ltd., Montreal, has been on a visit to New York.

Mr. William Leak of Leak & Co., Toronto, has returned to the city after spending a couple of the winter months at Bridgetown, Barbados.

R. E. Edwards, Sault Ste. Marie, Mich., general manager of the Wolverine Cedar & Lumber Company, has returned from a trip to the Southern States.

A. D. McRae, President of the Canadian Western Lumber Company, Fraser Mills, B. C., visited the Company's Toronto office during the last week in February.

Hugh Davidson, of the Hastings Shingle & Lumber Company, Vancouver, B. C., who has been spending several weeks recently in Ottawa, visited Toronto during the last week in February.

Mr. A. J. Hoolahan, on the staff of the B. Grier Lumber Company, Ltd., Montreal, has been appointed assistant secretary of the Montreal Builders' Exchange in succession to Mr. W. A. Stanley.

A. E. Clarke, of Edward Clarke & Sons, Toronto, has returned from a two weeks' buying trip in Quebec and reports the hardwood situation very strong. Soft-wood markets in Quebec are also strong, according to his report. Mr. R. L. Clarke, of the same firm, has been on a buying trip in the United States and reports the trade situation there somewhat improved.

Mr. Ernest G. Odell has opened an office as a wholesale dealer in lumber at 423 Coristine Building, Montreal. The offices will be under the supervision of Mr. U. E. Germain, for several years with the Tobin Manufacturing Company at Bromptonville. Mr. Odell represents United States firms handling hardwoods, yellow pine, &c., and will deal in all descriptions of Canadian and United States lumber. In Quebec there is a business carried on under the same name.

Newfoundland's timber wealth contributes largely to the volume of the colony's exports. The demand for native timber for local requirements is also increasing with each year. Authorities state that the lumbering industry together with that of the pulp and paper industries are worth to the colony about \$2,000,000 per annum, being an increase of about \$1,800,000 over that of ten years ago.

# Bathurst Lumber Company's Expansion

Mill and Property of Nepisiguit Lumber Company Acquired—Capital Increased from \$100,000 to \$1,000,000

Bathurst, N.B., Feb. 21.—Mill operations at Bathurst will be conducted on an extensive scale during the coming season by the Bathurst Lumber Company, Limited. This company have recently purchased the complete plant and property of the Nepisiguit Lumber Company which went into liquidation last year. The property includes over 500 sq. miles of limits and a most up-to-date saw mill at Bathurst with a capacity of 25,000,000 feet per season. The total holdings of the company now amount to over 1000 square miles of the best limits in the province. Their capital stock has been in-

Bathurst Lumber Co., Bathurst, N.B. View of Mill

creased from \$100,000 to \$1,000,000. The company will operate extensively in hardwoods, bringing logs in by rail over the new Northern & New Brunswick Seaboard Railway which taps a large portion of their limits. Mr. Angus MacLean, the well known lumberman, is General Manager of the Bathurst Lumber Co., with Mr. A. E. Loosen as local manager.

The Bathurst Lumber Company commenced its operations in 1907 when it acquired the properties of the Sumner Lumber Company. The old mill was destroyed by fire on March 31st, 1908. Less

Nepisiguit Mill, Bathurst, N. B. Acquired by Bathurst Lumber Co.

than ten months after the date of the fire the company had completed the erection of a new mill on the old site. The new mill, a picture of which is published herewith, is thoroughly modern in every respect and is absolutely fireproof. It is built of reinforced concrete and sheet metal and consists of the mill building, engine and boiler rooms. The boilers are set in steel casings, lined with brick, and are raised 7 feet above the floor by means of steel posts set upon concrete foundations. The engine room contains a 100 h.p. Robb-Armstrong engine and an electric generator which is used for lighting purposes only. The foundations of the mill are of concrete and

the first floor is supported by concrete pillars two feet square set upon rock foundations. The equipment includes two 8-inch band saws, one vertical resaw, two edgers and a number of smaller machines.

The mill is splendidly situated on the inner harbor and has good facilities for shipping either by rail or water. The output of the mill averages between 125,000 and 150,000 feet per day and has amounted at times to 175,000 feet in a day.

The mill of the Nepisiguit Lumber Company which has been added to the Bathurst Lumber Company's plant, is one of the most modern sawmills in Canada. It commenced operations on September 1st, 1910. The mill is located where the Nepisiguit River joins the waters of the harbor of Bathurst and possesses excellent shipping facilities both by land and water. The Caraguet Railway which connects with the main line of the Intercolonial Railway, has its terminus right at the mill property and the largest ships can come into the harbor and load at the company's docks. The main mill building is constructed of wood frame covered with galvanized iron and is 64 x 192 feet. Its equipment includes a twin rotary 51 inch gang weighing 45 tons, a rotary resaw, 8 ft. band resaw, band saw, automatic trimmer, edgers, slab slicer and lath machine.

## Halifax Shipments to United Kingdom

Shipments of lumber from Halifax, N.S., to the United Kingdom during 1911 are reported as follows:

	Sup. Feet
John E. Moore & Co., Ltd. ....	19,042,000
W. Malcolm Mackay ....	9,619,931
Colin C. Tyrer ....	6,448,287
Geo. McKean ....	8,000,000
I. H. Mathers & Sons ....	4,000,000

## Square Timber Output For Ten Years

The quantity of square timber measured at Quebec during the fiscal year ending March 31st, 1911, was 13,530 tons standard. This is the smallest quantity ever yet recorded. The figures for the last ten years were as follows: 1901-02, 62,452; 1902-03, 34,934; 1903-04, 36,749; 1904-05, 24,250; 1905-06, 22,821; 1906-07, 17,219; 1907-08, 19,310; 1908-09, 20,799; 1909-10, 18,498; 1910-11, 13,530.

The quantity of waney timber stringed during the fiscal year was 14,723 tons standard. The quantities stringed during the last ten years were as follows: 1901-02, 63,052; 1902-03, 42,616; 1903-04, 63,463; 1904-05, 61,520; 1905-06, 23,348; 1906-07, 8,033; 1907-08, 31,864; 1908-09, 28,921; 1909-10, 20,019; 1910-11, 14,723.

## Grading Rules for Barn

In the report of the annual meeting of the Canadian Lumbermen's Association which appeared in the Canada Lumberman of Feb. 15th an unfortunate typographical error occurred in connection with the grading rules submitted to the meeting, by Mr. W. J. MacBeth, Toronto. The rules as drawn up by Mr. MacBeth were printed in detail and in connection with the grading of white pine, No. 1 barn was improperly described, the definition being in reality the proper definition for No. 2 barn. The definitions of No. 1 barn and No. 2 barn as submitted by Mr. MacBeth were as follows:

No. 1 barn shall be 4 in. and up wide, will admit of sound round red knots of about 1¼ in. diameter, and must have good edges, no shake, bright sap.

No. 2 barn shall be 4 in. and up wide, will admit of sound red knots 1½ in. in diameter, an occasional tight branch knot, must have one good edge, will admit of some shake and stain.

No. 3 barn shall be 4 in. and up wide, will admit of sound red knots 1¾ in. in diameter, and smaller black knots, also branch knots, either red or black, if they are tight, considerable fine shake. 10 per cent. of the pieces may show stain on worst face.

# Sawmilling at Lake Jolly, Nova Scotia

Modern and Thoroughly Equipped Plant Operated by Messrs Clarke Brothers and W. E. Miller — Wide Variety of Finished Products Manufactured

Lake Jolly Mill and Yard—Looking South

**L**AKE Jolly, Digby County, N.S., is the location of an extremely interesting sawmilling plant owned by Messrs. Clarke Bros., and W. E. Miller, of Bear River, N.S., men who are widely known in the lumber business of the Maritime Provinces and who have established for themselves an enviable record, both as business men and employers. The accompanying panoramic illustration gives a splendid idea of the plant and its surroundings. On the extreme left of the illustration is to be seen the blacksmith's shop, next to which is shown the shed for drying staves. At the far end of the shed, the roof of the carpenter's shop is just shown. The building in the left foreground is the dry kiln, behind which is located the fire pump house. In the right foreground are shown the mill and the boiler house. The boiler house stack which is 4 ft. in diameter rises to a height of 90 feet. The small building in the foreground on the right is the hose house. Behind the mill is shown the waste conveyor and beyond that, a large quantity of logs in the lake which the company keep on hand for manufacturing. The illustration shows at a glance how compact and complete a plant the company have at this point. The logs in the lake are only a small portion of last winter's cut.

The power plant consists of three 14-ft. x 48-in. return tubular boilers furnished with improved Dutch oven furnaces, each of which has a grate area of 32 sq. ft. The boilers are tested to carry the pressure of 100 lbs. of steam but only 80 lbs. is carried, being all that is necessary for the operation of the plant. The boilers are fed by a Northey duplex pump, feeding through a closed exhaust

heater. A Penberthy injector is also connected up for feeding.

The engine room contains three engines, the principal one of which is 18 in. x 24 in., and runs at 145 r.p.m. The second engine is 10 in. x 24 in. running at 160 r.p.m. The latter engine drives the stave machine and other small machinery. The third engine, 3 in. x 8 in., drives the saw grinders, emery wheels and machine lathe. The 10-in. x 20-in. engine exhausts through the dry kiln or direct into the atmosphere as desired. Live steam can also be used through the dry kiln if necessary. The sawmill is equipped with a spur chain haul-up with live rollers in the bed, a kicker and a steam jump-saw. The carriage is operated on friction feed which is connected with steel rope.

The sawing equipment consists of 52-in. diameter saws which are operated at 800 to 850 r.p.m. Four 18-in. saws make up the edger. These are run at 1700 r.p.m. A pony gang carrying 18 saws 1 in. apart, 3 ft. long and running at 380 with a 14-in. stroke completes the lumber machinery, with the exception of slash and shim saws and trimmer. The equipment of the mill also includes a horizontal shingle machine for cutting shingles and heading from large slabs, a lath machine, stave machine, 2 heading machines, 26-in. planer, 12-in. x 12-in. matcher and moulder, a self-feed rip saw table, apple box machine, cherry box machine, buzz planer and a spoke lathe.

It will be seen from this description of the equipment that the mill is excellently provided for turning out a wide variety of product. It was built in the fall of 1899, Mr. Thos. Wright being foreman of construction and having occupied the position of millwright since that time. The machine superintendent, Mr. Warren S. Wright, a nephew of the former, assisted in the installation of the steam plant and has been attending to its operation and doing the machine work since the completion of the mill. The Messrs. Wright are men of long practical experience and have been largely responsible for the excellent working of the plant. With their assistance and with such a well equipped mill, the owners have been able to conduct a very prosperous business. They have a reputation as being among the finest men in the lumber business in Nova Scotia to work for. As a result they have been able to establish, among their employees, a most commendable spirit in securing skilled labor and are able to conduct their plant in an economically and general successful manner.

Exports of Canadian forest products during the fiscal year ending March 31st, 1911, were valued at \$45,439,057. With the exception of the year ending March 31st, 1910, this was larger than the amount exported in any one year previous. The exports for the previous year were valued at \$47,517,033. The imports of wood and manufactures of wood during the fiscal year ending March 31st, 1911, were valued as follows: free goods, \$12,647,533; dutiable goods, \$4,589,839.

Sawmilling Plant at Lake Jolly, N. S., owned by Messrs Clarke Bro's. and W. E. Miller

# Scientific Management in Lumbering

## Elimination of Waste and Perfection of Organization Essential to Success in the Lumber Industry—Importance of Keeping Records

By Prof. R. C. Bryant\*

Scientific management applied to manufacturing industries has received much attention during the last few years and has met with signal success. The central idea in this movement has been the increase in efficiency of the individual workman and of the shop, by collecting and reducing to a standard, facts concerning the best practice among the competent workers performing a given class of work; by the introduction of modern types of machinery operated at its highest efficiency; and by improvement of factory organization and supervision.

Individual lumbermen have done much thinking along these lines and have put some of the principles into practice. However, as a whole, the industry has not profited greatly from work of this character, for it is still a mooted question to what extent scientific management can be applied to the industry.

It is doubtful if there is any close analogy between the workshop, or factory with its specialized product, continuous operation without reference to climatic conditions; and the camp in the forest with its constantly changing crews, with climatic conditions which may hinder, or prevent operation for a certain period, and where every acre logged and every tree felled may present a new problem.

At the plant of the lumberman methods of manufacture can be standardized to a degree at least; the labor is more stable and the work may be under cover and thus adverse weather conditions overcome. However, even in the mill the problem is not so simple as in a factory. Each log presents a new problem to the sawyer who aims at the best results, because the position, number and character of defects are rarely the same in any two logs.

The methods of work outlined for manufacturing plants may not prove adaptable to logging and lumber manufacture, but the general principles underlying the schemes advocated by experts on scientific management contain many helpful suggestions to those who are interested in developing their work to the point of maximum efficiency.

The management of every large lumber operation should have on file in the office, detailed data regarding the title to the property, the character, the amount, and condition of the timber; methods of logging adapted to the region; a scheme for fire protection, etc. This can best be secured by the organization of a forest department in charge of a man capable of supervising cruising, engineering and forestry work. If the size of your operation does not warrant the establishment of the work on a permanent basis, experts can always be secured at a reasonable cost.

The high stumpage values of to-day call for more careful cruising than has been the rule in the past. The owner should know not only the amount of each merchantable species on his land, its location with reference to the topography and outlet; but also should have accurate data about its quality. A knowledge of the latter factor becomes more valuable with each increase in the price of stumpage.

Topographic maps are now considered an indispensable part of every manager's equipment, by all who have been fortunate enough to have used them. In a rolling or rough region they will save, in a short period, many times their cost.

Topographic maps are often made at the time of the timber cruise. They should show the location of all streams, roads, trails, swamps, burned areas, agricultural land, and the elevation of all points. On such maps are often shown in colors, the stand per acre of the different species. The exact location of all timber, the position of light and heavy stands, burns, etc., can be seen at a glance. Accompanying this map should be a report on each logging unit giving all data that is necessary for an intelligent understanding of the problems involved in logging the area.

The entire system of logging roads can be laid out in the office on such a map, and a logger may know several years in advance where his main roads can be located to best advantage; the mileage required and any special difficulties that must be overcome. Careful planning of roads with reference to logging the area as a whole effects a saving in logging costs by reducing the amount of road building.

### A Practical Demonstration

The value of a map of this character was demonstrated during the spring of 1909. The senior class of the Yale Forest School made a survey and prepared a topographic map of a tract of 30,000 acres in eastern Texas, in a region where railroad location was not easy,

because of the broken character of the country. The engineer of the company about one year later was called upon to build an eight-mile extension to the main line which was to pass over a portion of the tract surveyed, and over which he had never travelled. He laid out the road on the topographic map in the office before beginning field work. After selecting the route which looked most feasible, he went to the field and was able to locate on the ground over five miles of road on the route he had chosen in the office. The location of the remainder of the line was not altered more than a few hundred feet at any point. The work was accomplished in one-fourth of the time required under the old method.

Maps and data of this character are also a great aid to the management because they preserve on paper a vast amount of valuable information often carried in the heads of certain woodsmen of the company. These men may leave your service, and the knowledge they have gained at your expense is gone and can only be acquired by the expenditure of more time and money.

A new foreman can be taught more about your property, in an hour, from a topographic map than he could learn by traveling over the ground for a week. Further, it enables you to discuss with him the plans for logging; shows the area to be logged the next season; the mileage of road to be built; the character of "logging chance" he will have and many facts that he often otherwise has to determine for himself when he arrives on the ground.

No lumberman should be satisfied with his operation until he has proven to himself that he has a system as efficient as it is possible to secure. Forest laborers, as a rule, do not migrate out of the general forest region in which they receive their training, and consequently have no opportunity to learn methods other than those common to that particular section. Although the methods in use are usually those best adapted for the conditions existing there, it often happens that woodsmen in other regions have developed methods that are preferable for special conditions you may have to meet. The collection and standardization of the methods of progressive loggers in a given section would be most valuable to every operator.

The organization for the protection of the property against fire is one of the least efficient parts of many lumber operations. Companies conservative in business who carefully protect their manufacturing plant often neglect their stumpage, a product far more difficult to replace than a mill on which insurance can be secured. Although practically non-insurable, stumpage has been left to care for itself until the last few years, and in some sections it still does not receive ample protection.

Every large company should have some comprehensive scheme of fire protection worked out for its tract, and an organization capable of putting the policy into effect when it is required.

### Care of Details

Improper supervision of felling and log-making crews often results in waste. Through the faulty selection of log lengths and careless marking off of the same, the daily loss often averages several hundred feet log scale per crew. Breakage, due to careless felling and other causes, may increase this amount. A daily waste of 500 feet log scale per saw crew due to carelessness has been observed on yellow pine operations in the South.

The loss to the stumpage owner is greater than first appears, because it is not only the stumpage value that is sacrificed, but the sale value of the product on the car. It requires but little more effort to bring in a log 11 feet long than it does one 14 feet long; the cost of skidding, loading, and transportation to the mill, are increased to only a very limited extent, and on reaching the plant the added cost of manufacture is nearly nil. Therefore you lose the value of this product on the car, because it costs you practically no more to place it on board ready for shipment than it does to leave it in the forest to rot. Close supervision of the saw crews will remedy this matter at a cost which will be a fraction of the loss you otherwise suffer.

There is a wide variation in the rations given to logging animals, and it is certain that they are not always fed economically. The requirements of animals for food are dependent on weight and the amount of work being performed. Each animal requires a certain amount of concentrated food from which it derives the major part of its nourishment and a certain quantity of coarse food which gives bulk to the ration.

There are several essential elements in the concentrated foods which are required in fairly constant quantities for a given weight

\* Reprinted from "American Forestry"

of animal, when performing a specific kind of work. Different feed stuffs contain these elements in widely varying proportions, and the test of a balanced ration is the ability of an animal to maintain an even weight under the conditions in which it is working.

Every logger should adopt a standard ration for his animals based on tests made under working conditions. The general requirements of animals have been studied extensively both in this country and abroad and data on the subject can be secured from the United States Department of Agriculture.

Many business men spend much time on the preparation of statements showing the cost of production. These are of value as a guide for comparison of actual costs, but do not show whether the average is greater than it should be.

A close study of the various parts of the operation and the preparation of a statement from the data secured, offers a means of comparison of actual and standard costs, and will point out the weak points in the present system. It enables the management to pick out the departments in which the expenditures are excessive, and to make such changes as are necessary to remedy the faults.

Estimated costs exert a beneficial influence over foremen and other subordinates, because when the actual outlay exceeds the estimate made by them at the beginning of the season their reputation is at stake. The incentive is present for them to attempt to keep expenses down. Where there is no check of this character, it is easy for the foreman to say that high costs are due to special difficulties encountered, such as inclement weather, bad bottom, or similar factors.

One of the largest operators in the northeast has given the subject of "efficiency" in woods operations much thought. His scheme requires the collection of data regarding the property preliminary to the beginning of operations; careful supervision and inspection of all parts of the woods work; and a system of records in which detailed account is kept of all work to be performed and all work actually performed.

The plan has been developed from the management side because the company has not yet satisfied itself that a piece work basis of remuneration, with a bonus for superior work, is adapted to their conditions.

The general scheme has been built up gradually and is the result of years of thought and study. While it has met the needs of the particular operation for which it was designed it may not be applicable in all of its details to other operations. It is adapted only to large business concerns, because of the added inspection and clerical force needed to carry out the plan.

#### Keeping Accurate Records

The system of records is of interest because of its completeness and the success which has attended its use. These comprise three separate sets of books known respectively as the budget, accounting and the statistic.

The budget contains a statement of the work to be accomplished during a given period, preferably for the coming season.

It covers all phases of woods work and is made up by foremen and others in charge of field work. It contains a concise statement of the exact character of the work to be performed under a given foreman's direction; the dates on which, or the period in which it is to be performed; the number of men, animals, equipment and supplies required; and the estimated cost in detail. From this budget the management learns just what work each foreman considers essential; can determine when, where, and what supplies and equipment are needed and the approximate expenses of logging for the season. The company also has a standard with which the actual costs can be compared, and if the estimated expense is exceeded, or additional equipment or supplies called for, explanations are in order. In fact, the budget reduces loose guess work to a system.

The second branch, called accounting, deals with the records that pertain to the conduct of the scheme laid down in the budget. The object is to collect reliable and prompt reports regarding the operation in order that the management may have a statement showing the exact status of work to date. This file does not leave the office. Extracts from it may be sent out to subordinates to whom it may concern.

The statistical feature of the records is concerned with the accumulation of the experience and data secured in carrying out the operation. This is the basis of new schemes, or revision of old. It is also an office record.

The manufacture of lumber is under the direct supervision of the management and the details of organization have received more careful attention than those in woods work. Certain forms of mill work also lend themselves more readily to standardization. Among these may be mentioned unloading logs at the pond, lumber piling and loading, dry kiln work, etc. Work of this character is frequently performed by contract, but even so it may not be done economically. In numerous instances the costs of manufacture could be reduced by a careful study of conditions at the plant.

An example of this was observed in a large mill in the South where, for that section, an unusually intelligent class of foremen were in charge. The cost of operation was considered below the average of mills in the region and the management was satisfied with the results.

The plant consisted of two separate mills, yards, and planing mills, but had only one system of sheds. The yards were each in charge of a foreman, and the sheds were under the supervision of one man. A certain amount of jealousy arose between the different foremen in an effort to keep down the cost in their department, and each man was inclined to throw minor expenses on some other foreman.

To obviate this and to secure closer co-operation among the foremen engaged in handling lumber, a re-organization was made. One yard foreman was assigned to other work and the two remaining men were called to the office and a proposition made to them. The management calculated that the cost of operation in the two departments, through co-operation could be reduced at least ten cents per M. feet. They therefore proposed the following; they would guarantee to each foreman the regular salary he had been receiving and in addition one-half of all the saving effected below the sum fixed as the standard cost.

No provision was made by the management for compensating the individual workmen, since the foremen had the authority to hire such labor as they required and pay such wages as were necessary.

The proposed plan met with much favor, and after discussing the situation the foreman decided that they could dispense with fifteen men in the two departments, and accordingly had them transferred to other work. The tasks of some men were increased with added pay, in other cases a more systematic plan of operation took care of the extra work without imposing undue burdens on any laborer.

The results secured by this arrangement were favorable from the start, and the foremen not only kept the price of the standard set, but soon had reduced it five cents, and have in view new methods which would still further cut down the cost. The consequence was that the company was getting its work done cheaper than formerly and the foremen were making higher wages than they could hope to secure under the old system. A stronger personal interest in the work on the part of the men concerned was manifest from the start. This company has in mind the extension of the system to other work around the plant and also to some of the work in the woods.

#### The Piece Work System

Another application of the piece work system to the lumber industry was observed in a cypress mill which was visited in 1907. The system at this plant has been extended to cover railroad construction, deadening timber, felling and loading on the car, and shingle and lath manufacture.

The method of payment for sawing lumber is unique. In order to encourage the production of high grades of lumber a scheme was devised for the payment of sawyers, edgemen and trimmers on a basis of quality as well as quantity. A scale of wages on a basis of M feet manufactured was drawn up and in it a premium was placed on the higher grades, with no payment for No. 2, or poorer lumber.

The company has a shingle mill in connection with the plant in which the inferior logs and cants are utilized. In order to overcome the tendency of the sawyers to cut the high grade lumber from the outside of the larger logs and send the inferior center to the shingle mill, a standing order is in force to cut any kind of lumber rather than to send material to the shingle mill.

The tendency of the sawyers to escape cutting low grades is also checked by paying the mill foreman on the basis of the mill cut, without reference to quality. The foreman's desire for a maximum output, coupled with the sawyer's desire for quality, keeps the work at a high point of efficiency and yields satisfactory results from the standpoint of the management.

The piece work basis of remuneration has been used for many years by lumbermen, especially in the South. Its introduction was due largely to the irresponsible character of the labor from which satisfactory service could seldom be secured on a daily wage basis. Although widely applied, this system has been considered chiefly from the standpoint of the employer, and little thought has been given to aiding the employee to become more efficient at his task, or to offer him any incentive for increased effort.

Along with the development of the labor problem will come plans for the better care and management of the forest, more intensive methods of logging and manufacture, and the closer utilization of the raw material of the forest and the finished product at the mill.

The economic forces that are driving industrial plants to adopt more scientific methods of management, in their fight for existence, will soon become vital to the lumber industry. The greatest measure of success will come to those who have intrenched behind an organization which will enable them to place their product on the market at the lowest possible cost in competition with their rivals.

# Lumber Trade of Quebec During 1911

Increased Consumption of Sawmill Product by Canadian Markets— Square White Pine Production a Negligible Quantity— Details of the Year's Shipments

J. Bell Forsyth & Company's circular upon the lumber trade of Quebec during 1912 deals with the subject in part as follows:

Trade in Canada continues very good, and a large and increasing proportion of the production of Canadian sawmills is consumed in the Dominion. General trade on the United Kingdom, as shown by record imports and exports for the past year, has attained unprecedented figures, although the business of the country has been greatly hampered by strikes. Political agitation and unsettled labor conditions make the business position one of anxiety and uncertainty, though the settlement of the lockout in the Lancashire cotton trade has to some extent relieved the immediate outlook. In the United States, as usual in the Presidential election year, the uncertain political position affects general business adversely in spite of heavy crops and increased trade.

White pine.—The supply of waney pine shows a larger production of this wood than for some years past, resulting from the marked and sustained advance in price having at last had its usual effect. The manufacturer of present winter will result in a still larger quantity coming forward next season. The wintering stock, though moderate, is greatly in excess of the unprecedentedly light one of last year. Fortunately the increased amount that will be available for shipment will be of good average length and girth, and will come on a bare market in the United Kingdom, with every prospect of a good demand, especially from the shipbuilding centres. Square white pine is no longer made, except in negligible quantities.

	Supply	Export.	Stock.	
1911 Square . . .	10,680	1,069,428	5,547	Square.
Waney . . .	1,222,698		204,071	Waney.
1910 Square . . .	10,720	747,353	3,472	Square.
Waney . . .	541,440		64,981	Waney.

Red pine.—There is no export demand for this wood. Probably none will be made this winter and what is now in Quebec will go into local consumption.

	Supply.	Export.	Stock.
1911 . . . . .	27,720	3,841	31,332
1910 . . . . .	21,920	6,653	16,302

Oak.—Though the stock on hand exceeds last or the previous season's export, to some considerable extent it consists of wood unsuitable for export on account of size and quality, as the only demand in the United Kingdom is for first class white oak 14 inches and upwards deep. A moderate quantity of new oak is being made, but there is considerable uncertainty as to when it will reach Quebec.

	Supply.	Export.	Stock.
1911 . . . . .	133,280	317,498	358,475
1910 . . . . .	256,680	342,588	561,725

Elm.—Rock elm has become very scarce and costly. The supply seems unlikely to exceed that of recent years, and may even fall short of some. A very considerable advance in price seems inevitable.

	Supply.	Export.	Stock.
1911 . . . . .	246,680	288,743	34,873
1910 . . . . .	246,920	259,233	78,581

Ash.—This wood, once so largely shipped, has now practically gone out of production, and is no longer required for export. The figures given show that the export business in this wood from Quebec is virtually at an end.

	Supply.	Export.	Stock.
1911 . . . . .	620	396	990
1910 . . . . .	1,400	1,232	683

Birch.—There has been a marked increase over the previous year on the quantity shipped from Quebec. Considerable shipments are made from Montreal, but as no separate records are available of such shipments, it is impossible to give same. Prospects in the United Kingdom for this wood are encouraging, stock being low and demand good.

	Supply.	Export.	Stock.
1911 . . . . .	169,690	169,586	.....
1910 . . . . .	129,191	129,332	.....

Spruce deals.—As it is impossible to obtain full particulars of shipments from St. Lawrence ports, and as there is a similar difficulty in connection with exports and stocks, it is found advisable not to give such partial returns as are available. Such mill owners as

place their production with shippers on this side are reported to have generally sold next season's output at previous prices, which in view of certainly higher freights, means a substantial c.i.f. advance for importers on the other side, where these goods appear to find an increasingly difficult competitor from the Baltic, or Riga whites.

Pine deals.—The business of the port in these is a thing of the past. The shipments from Montreal tend to decrease, and sidings and boards have to some considerable extent taken their place.

Sawn lumber.—Good pine and high grade pine lumber now stand at record figures, and the demand from the United States continues good. There is not much change in lower grades. The export of sawn pine lumber is diminishing.

Freights.—Remained at about last year's level till the early fall, when a marked improvement took place. For timber from Quebec early rates were 52s. 6d. Manchester with 55s. for Greenock and 60s. for Tyne, but later in season 67s. 6d. was paid for Greenock and 60s. for Liverpool. For deals from Montreal 30s. was general liner rate for Liverpool and Glasgow with 35s. for London on agreements made before the advance in ocean freights.

The following comparative statement shows the number and tonnage of sailing vessels cleared at the port of Quebec, for sea (lumber laden), 1896 to 1911, from opening to the close of navigation.

The Port of Quebec includes the Saguenay and Lower St. Lawrence.					
1896—145	Vessels,	113,755	tons	1904—46	Vessels, 19,126 tons
1897—147	"	90,381	"	1905—46	" 9,258 "
1898—121	"	70,588	"	1906—52	" 19,064 "
1899—80	"	50,242	"	1907—36	" 9,568 "
1900—99	"	43,036	"	1908—29	" 11,902 "
1901—69	"	37,171	"	1909—25	" 8,307 "
1902—93	"	33,534	"	1910—22	" 7,726 "
1903—53	"	25,141	"	1911—23	" 3,350 "

## Lumber and Timber Exports

The following summary shows the export of timber, deals and lumber from the St. Lawrence during the season of 1911.

SHIPPERS	Montreal	East of Montreal	Total Ft. Bd. Meas.
W. & J. Sharples . . . . .	10,222,362	36,682,575	46,904,901
Dobell, Beckett & Company, Limited . . . . .	4,958,723	20,415,864	25,374,587

## Vessels Cleared with Lumber from Quebec

Total steamers cleared in 1907, 170; 578,604 tons, for part and entire cargoes.

Total steamers cleared in 1908, 165; 595,878 tons, for part and entire cargoes.

Total steamers cleared in 1909, 151; 519,242 tons, for part and entire cargoes.

Total steamers cleared in 1910, 130; 610,172 tons, for part and entire cargoes.

Total steamers cleared in 1911, 165; 726,233 tons, for part and entire cargoes.

The following statement shows the number of cars of deals, timber, pulp wood, etc., carried by the Quebec and Lake St. John Railway—for the year ending 31st October, 1911: Deals and lumber, 4,626 cars; cordwood, 1,671 cars; square timber, 150 cars; ties, 125 cars; pulp, 1,728 cars; pulpwood, 875 cars.

### National Wholesalers Preparing a Good Programme

Arrangements are rapidly approaching completion for the annual meeting of the National Wholesale Lumber Dealers' Association, which is to be held in Louisville, Ky., on March 6th and 7th. An unusually large attendance is expected and special cars are being arranged for, by members in several of the eastern states. Large delegations are expected from manufacturing, wholesale and retail associations. The Louisville hardwood club, who will be the hosts of the convention, are leaving nothing undone which will contribute to the comfort and entertainment of the delegates. The annual banquet will be held on the evening of March 6th and will be attended, not only by the members but by their lady friends. Several attractive side trips are being arranged. On Thursday evening the men will be entertained at a smoker, and a reception will be held for the ladies.

### Turning Slabs Into Pulp

North Bangor, N. Y.

Editor Canada Lumberman:

I have read your timely hint relative to making use of slabwood, and other mill refuse, published in a recent number of the Canada Lumberman, and wish to make a few remarks thereon. There are quite a number of pulp mills in this country using slabs in the manufacture of pulp. The State of Pennsylvania leads with 65,061 cords. Next followed by Maine and West Virginia. The 13,000 cords of beech credited to Pennsylvania came to the mills in the form of peeled slabwood.

The following are a few of the American firms using mill refuse in the manufacture of chemical pulp; Kathadin Pulp & Lumber Co., Ltd., Lincoln, New Hampshire; George Henry & Son, Lincoln, New Hampshire; Carthage Tissue Paper Mills, Carthage, N.Y.; Parsons Pulp & Lumber Company, Parsons, W. Virginia. The Parsons Company manufacture their entire daily product of sixty tons of chemical fibre, exclusively from peeled spruce and hemlock slabs.

In regard to the large mills of Ontario, where large quantities of slabs are consumed in the business, a few questions would come up relative to marketing the slabs, namely:

- (a) The cost of transportation to the nearest consuming market.
- (b) A means of rapidly and cheaply peeling wood at the point of shipment.
- (c) A price per cord at the point of delivery that will insure a margin of profit.

First of all, slabwood should be shipped by rail, peeled. In West Virginia spruce and hemlock are mostly peeled at the stump. This could not be done conveniently in the pine forests of Ontario.

Mill refuse, consumed in the burner, would furnish material for all the chemical fibre made in Canada, and a great many thousand cords left over.

This all points to a conservation of the forests. The more mill refuse used the less circular wood used, and consequently, less cutting of the forests.

Yours truly,

GEORGE B. OBERTON.

### Opposed to Free Import of Pulp and Paper

At a recent meeting of the Home Market Club of Boston a resolution was passed unanimously, against the free importation of wood pulp and print paper from Canada and the possible extension of the privilege of free import of wood pulp and print paper from other exporting countries. The resolution was as follows:—

"Whereas, wood pulp and print paper have been placed on the free list so far as Canada is concerned, notwithstanding that the expected concessions on the part of Canada have been denied us, and whereas demands are now being made under the favored nation clause by all paper exporting countries for the same tariff privileges which have been extended to Canada;

"Be it resolved, that we protest against this unjust treatment of United States paper manufacturers and respectfully petition Congress to repeal this legislation."

Secretary Marvin, after the adoption of the resolution pointed out that in 1906 and 1907 the paper producing countries of Europe, held by Norway, Germany, the Netherlands, Austria and Great Britain, had a surplus for export amounting to \$337,127,000, or nearly twice as large as the entire paper and wood pulp production of the United States.

### Pulp Prices Increasing

The beneficial effects of the Gouin law prohibiting the exportation of pulpwood cut on Crown Lands are beginning to manifest themselves. United States buyers of pulp wood are now paying from \$7.50 to \$8 a cord for peeled wood. These prices are fully one dollar in advance of those prevailing a year ago. Last year about 900,000 cords of pulp wood were exported from this province. This

year it is estimated that not more than 600,000 cords will be exported. Eventually the supply of pulp wood will become so scarce that United States pulp and paper mills will be forced to locate in Quebec province. Last year nineteen pulp and paper companies with a total capitalization of \$41,700,000 were in operation in Quebec Province.

The annual report of the Minister of Crown Lands for Quebec shows a surplus of nearly \$1,000,000 for the last fiscal year. The increase in revenue from the stumpage dues alone over the preceding year amounted to \$85,000, and the department gives promise of showing an annual revenue of about \$1,500,000. Quebec to-day owns 6,468,368 acres of land surveyed and divided into lots. The new forestry school, which was established by the Government and affiliated with Laval University, has forty students.

### A New Simonds Catalogue

The 1912 issue of Simonds Saw Catalogue has been issued from the Montreal office of Simonds Canada Saw Company, Limited.

This is a 174 page book printed on high grade paper and illustrated throughout with excellent half-tone engravings. The full line of Simonds circular, band, cross-cut, and hand saws is listed, and several pages are devoted to Simonds woodworking machine knives.

Among the new pages which appear in this catalogue and not in former issues, are those devoted to pit and whip saws, high speed steel planer knives, cane knives, docking saws, also a page showing a Simonds crescent ground cross-cut saw fitted with the double horn handle. To catalogue thus early this new handle is an indication of the way the printed matter of the Simonds Canada Saw Company is kept up-to-date according to the requirements of the supply dealers and of the lumber trade.

This catalogue is sent to all hardware dealers who may request a copy. A special issue has been prepared for the use of filers and millmen who want a convenient pocket size catalogue for ready reference. Readers of the Canada Lumberman who are interested should write Simonds Canada Saw Company, Limited, Montreal, asking for a copy of their 1912 catalogue.

### Lower Freight on Transcontinental Lumber Shipments

Within six weeks the transcontinental railroads of the United States will issue a new lumber tariff which will establish through rates on lumber and shingles from Puget Sound points to Montreal and other points in that territory. Through rates have been in effect to New York and Boston for some time, but a combination of rates has been arranged to be used on shipments in the eastern portion of Canada. The effect of the new tariff will be to cut the rate on forest products to that territory about two cents per hundred pounds. The rate will be 85 and 75 cents respectively, for lumber and shingles. Considerable lumber and shingles have of late been moving into the section affected, so much in fact, that G. C. Fairbanks, traffic manager of the Pacific Coast Shippers' Association, incorporated the new rates in the association's rate book now in course of preparation.

### A Trying Winter in Bruce Peninsula

J. E. Murphy & Co., Tobermory, Ont., manufacturers of lumber, shingles, lath, etc., report that the present winter has been a most trying one for operators. In their opinion the output on the Bruce Peninsula will be about 40 per cent. less than that of last year and the cost of production will be from \$2 to \$3 per thousand greater. They report that it has been impossible to get a road to carry a load of logs properly. On account of the continued snow falls and the excessive frost both men and horses have suffered severely.

### Government Sells Petawawa Limits

Negotiations begun with Hon. Frank Cochrane by the lessees of timber limits on the Petawawa River are reported to have been renewed with Hon. W. H. Hearst, Minister of Lands, Forests and Mines for Ontario. There is some white pine on the limits and the lease-holders, it is stated, would sell out for \$300,000. This has been regarded by the government as a high price for 600 miles of country already cut over. If there is a reduction in price negotiations may result in a purchase.

### A Large Order for Mackinaw

A representative of the Canada Lumberman recently visited the office of Hewson's Limited, Amherst, N. S., and during his visit, the President, Mr. H. L. Hewson, received an order by telegraph from a dealer for 12,000 yards of pure wool heavy weight Mackinaw. Although Hewson's Limited are recognized from the Atlantic to the Pacific as makers of fine tweeds and worsteds for the high class tailoring trade, they have a branch devoted entirely to the needs of the rapidly developing lumbering and north country trade.

# Hardwood Manufacturers' Meeting

Largely Attended Convention Held at Cincinnati—  
Statistics of Hardwood Stocks, etc., to be Gathered

The 10th annual convention of the Hardwood Manufacturers Association of the United States which was held at Cincinnati, Ohio, recently proved to be one of the most successful and important in the history of the association. The attendance was close to 700 and was representative of every branch of the industry. One of the most important features of the meeting was the decision to assess the members of the association 1c. per thousand feet of their product as a contribution to the advertising fund of the National Lumber Manufacturers Association. Mr. W. E. Delany, Cincinnati, Ohio, was elected president. The secretary, Mr. Lewis Doster was unanimously re-elected.

Another interesting feature of the convention was the conference of oak producers. This was largely attended. One of the principal reasons for calling this conference was the lack of information among oak producers, as to the supply of oak in various parts of the country. It is practically unknown to the individual oak manufacturer whether there is really a surplus in any grade or thickness of either quartered or plain oak, or whether a positive scarcity exists, relative to the probable demand. After a discussion of this situation it was decided to make an immediate effort to collect statistics of the supply of oak on hand and of the quantities likely to be produced during the present year. A committee was appointed to draw up a plan for securing this information. The committee reported that in their belief the oak and chestnut manufacturers should attempt a closer co-operation. They suggested that information should be obtained, as to the exact conditions existing, in regard to oak and chestnut, as to the amount of feet in stock of various thicknesses and grades, if plain and quartered oak and chestnut, both dry and green; also the number of orders booked, and the estimated amount to be cut, during 1912. The committee also suggested that information should be secured regarding prices, and that the work of compiling all this information should be undertaken by the secretary of the National Wholesale Lumber Dealers Association.

The meeting decided to carry out the suggestion of the committee. The information will be compiled without the use of the names of the individuals or firms supplying it and will be transmitted to all manufacturers and dealers who assist in the effort to secure it. It is expected that this conference and discussion will result in a series of further conferences of a similar nature.

In spite of the lack of information regarding the market situation, it was the general opinion of those present that an exaggerated idea existed of the stock on hand and of the amount to be produced during the next 3 months, especially in the upper grades of quartered stock.

## The Outlook for a Single Set of the Grading Rules

The president of the Hardwood Manufacturers Association, Mr. W. B. Townsend, in his annual address drew particular attention to the work of the bureau of grades, referring particularly to the effort which had been made in the direction of establishing one set of grading rules or a single standard of inspection for the whole of the United States. A conference at Chicago, and another at Louisville, Ky., had been held in this connection, but unfortunately had been unable to accomplish the purpose in view. He believed however, that before long, a single standard would be adopted, provided the manufacturers of hardwood co-operated in a sincere endeavor with that object in view.

The production of the mills represented in the association had been increasing steadily and was now very close to the billion mark, of hardwood alone. Many of the members manufacture large quantities of hemlock, pine and spruce also which of course is not included in this estimate.

Referring to business conditions, during the past year the president congratulated the members upon having been able to secure fair returns. Although prices had not been satisfactory in many cases, when compared with the cost of production, as a whole, business when properly managed had yielded moderate profits. There had been few failures and collections had been satisfactory on the whole. Particular attention was drawn to the broken condition of stocks. Inventories completed during the month of January, showed that there was much less stock at the mills than a year ago. There was an especial scarcity of plain oak timbers. This was one of the causes of the increasing cost of production and it was important therefore to give close attention to the low price and lack of profit at which it had been marketed. In the opinion of the president, this situation, perhaps, more than any other should be considered seriously by the producers.

The secretary in his annual report gave interesting statistics of

the production and stock on hand of the members of the association. The estimated normal capacity for carrying stock was 475,260,000 feet and the estimated stock on hand was 225,100,000 feet; there being a deficit therefore of 250,160,000 feet. A preliminary report of the stocks on hand at the point of production showed a very large percentage of shortage.

Dealing with the matter of inspection, the secretary stated that during the year 1910 the members of the association had shipped 659,022,000 feet, of which only 6,324,127 was made the subject of complaints, amounting to 9/10 of 1 per cent. of the total shipped. In 1911 the total shipments had been made 630,212,000 feet, of which only 6,215,908 had been made the subject of complaint.

The secretary reported that the system of instruction at mills and the more complete study of the mills was reducing each year the misunderstandings which formerly were so prevalent, and allowing a more satisfactory relationship between the shipper and customer.

The value of hardwood lumber, as a whole, during the past year has receded, even in the face of the lighter output and the increasing cost of production. Standing timber had advanced in price, labor and all commodities in the nature of supplies for the sawmill had risen in price.

## Northern Hemlock and Hardwood Cut

The following statement of the cut and shipments by the same 56 firms in January, 1912, compared with January, 1911, is compiled from the Northern Hemlock and Hardwood Manufacturers' Association records:

	Cut, M. Feet		Shipped, M. Feet	
	1912.	1911.	1912.	1911.
Hemlock . . . . .	17,147	12,720	22,234	21,592
Ash . . . . .	370	211	531	426
Basswood . . . . .	2,516	3,019	2,677	2,251
Birch . . . . .	4,361	4,709	3,795	4,595
Elm . . . . .	1,425	1,019	1,421	1,213
Maple . . . . .	2,655	2,804	1,864	2,180
Oak . . . . .	229	143	181	242
Mixed . . . . .	3,110	3,491	3,264	1,462
All hardwoods . . . . .	14,666	15,396	13,733	12,369
Total . . . . .	31,813	28,116	35,967	33,961
Increase in hemlock cut, thirty-five per cent.				
Increase in hemlock shipments, three per cent.				
Decrease in hardwood cut, five per cent.				
Increase in hardwood shipments, eleven per cent.				
Increase in total cut, thirteen per cent.				
Increase in total shipments, six per cent.				

## F. B. McCurdy Addresses A. P. and P. A.

At the annual banquet of the American Paper and Pulp Association on February 15 at New York, one of the speakers was F. B. McCurdy, M.P. for Queen's-Shelburne. Mr. McCurdy alluded to the fact that the supply of wood was the serious problem confronting paper and pulp manufactures in the United States, that thirty per cent. of the pulp wood consumed there came from Canada. He said that Canadians were desirous that all raw materials, including pulp wood, should be manufactured in this country. That was what the National Policy established in 1870 aimed at and the result of the elections last September, stripped of all side issues, was a pronouncement against changing the protective policy under which the Dominion had achieved remarkable prosperity. Canadians had become much interested in the conservation of their supply of wood, and already United States pulp and paper manufacturers had purchased large pulp wood areas in Canada. He bespoke the co-operation of Americans with the Canadian authorities in the protection of the wood supply. American paper and pulp manufacturers had already established substantial manufacturing enterprises at the Canadian Soo, Three Rivers and La Tuque. Under conditions as they exist, said Mr. McCurdy, I look forward with confidence to seeing the government policy for the conservation of wood lands and manufacturing by Americans in Canada continue with increasing volume.

## Railways Must Maintain Efficient Fire Patrols

Reports from Ottawa state that the Dominion Board of Railway Commissioners have decided to adopt regulations calling upon the railway companies operating in the railway belt in B. C., to maintain efficient fire patrols after all trains in forested districts, during the dry season, so as to reduce the number of fires resulting from sparks issuing from locomotives. The intention is to issue the order before the month of May so that it will be effective during the coming summer.

### Progress at British Columbia Lumber Company's Plant

Eighty men are at work at Lulu Island, B.C., where the British-Canadian Lumber Company is building a large mill designed to turn out, when completed, 25,000 feet of lumber an hour. Work was started on September 1 last year, and will probably be complete some time in August or September of this year. Already some 3,000 piles have been driven, and the mill building is rapidly nearing completion. Besides the sawmill, measuring 72 by 378 feet, shingle and planing mills and a box factory will be erected. The main mill building itself will have two storeys over all, and a third measuring 60 by 72 feet, where the filing machinery will be located. All saws and mill machinery will be on the second floor, while the motive machinery will be on the ground floor. This building, with the bulk of the other buildings, stands over the water. In addition to the buildings already described, a deep-water dock 800 feet long will be constructed, so that the mill will be able to enter the overseas trade. The B.C.E.R. will supply shipping facilities by land. Altogether, about \$500,000 will have been invested in the building and plant before it is completed.

### Lumber Cut of the Duluth District

A prominent Duluth lumberman estimates that the cut of the Duluth district for the year 1912 will be not less than 550,000,000 feet and that 200,000,000 feet already has been sold. The figures are based on a large number of inquiries made of the principal producers of lumber in the district since Jan. 15. The production which is estimated for the district is a few million feet less than the average for past years, but the estimate of stock already sold is unusually large for the first month of the year. The low grade lumber of the district, No. 4 and 5 stock, is readily being picked up by the box manufacturers of the country, and a great many of the lumber producers have sold their season's cuts of these grades. The demand for No. 3 and better is very fair for the time of year, and the prospects now are that at least 75 per cent. of the present estimated cut for the district will have been sold by the opening of navigation. If the conditions continue to improve, and many of the lumbermen are now convinced that they will, the production of the district may be materially increased before the season is ended. In the old days when lumbermen depended entirely upon rivers to deliver them their season's cut of logs it was not possible to increase production even if they had the mill capacity, unless they happened to have a surplus over the original quantity provided for. But in these days of logging railroads it is possible to put crews at work in summer and increase the log supply at any time.

### Are Lumbermen Strangling their own Business

By Julius Seidel\*

For many years past I have been impressed with the changes occurring in our business affecting the uses of lumber. These changes have been slowly but surely taking hold of the public mind until now they are a serious menace to our best interests and unless we hasten to check the injury already done it is apt to undermine our trade and have direful results on the entire industry from stump to finish.

I am referring to the uses of substitutes for lumber, substitutes for shingles, substitutes for lath, substitutes for ceiling stuff, for siding, tanks and troughs, mining work and bridges, not to speak of furniture, packing boxes, cooperage, ties, poles, etc.

We dealers are more directly interested in the substitutes that affect the uses of lumber for structural or building work and to these I will turn your attention. The strange part of the proceedings is the fact that, we dealers have been the too willing promoters of substitutes for lumber without considering the recoil to our best interests, which must come if we continue in the channels that we have been pursuing.

In the selling of these substitutes I believe we have deceived ourselves and have been led on to give their sale our best efforts and attention because the profit derived therefrom seemed alluring.

We charge our lumber account with every expense of doing business, such as hauling, handling, office expense and hire; and in handling side lines figure the profit derived from the sale of roofing paper, iron ceiling and roofing, tin and newfangled shingles, plaster and paper boards as strictly "velvet." Indeed, we chuckle when we make a sale of these substitutes and call the margin over cost a "clear" profit. It is this phase of it I believe that has been the bait to push their sale. Neither the manufacturers or the retailers of lumber have been defenders of the uses for lumber.

We hear the public say "lumber is high," and give scant notice to or fail to rise to defend such an erroneous impression and squelch it on the spot. I have taken occasion to talk to some few people

who told me this, with the result that I found they had read about about wanting woods such as walnut, cherry, poplar and white pine. The first of these woods we know have been obsolete for commercial uses for many years and the latter, white pine, is rapidly becoming so for building work. When told that we have substitutes such as yellow pine, fir, redwood and cypress at prices equal to or even lower than the old standards for wood construction formerly sold for, they look aghast and say, "Is it possible?" Stating why, I read in this magazine or that paper that the lumber supply was being exhausted. They then lead off to tell you, however, about having a few fine trees of walnut, cherry or oak on their farm, which they would like a market for, and would be willing to part with at twenty-five dollars per tree. I am afraid that the thought of a diminishing lumber supply has been encouraged instead of being refuted. Yes, it is true acres of timber has been felled and the land cleared for the plow-share, but other districts stand ready to supply lumber in exchange for farm products which they don't produce. Believe me, that raising \$1 per bushel wheat, beats raising or cutting up timber land and selling it to the public.

It is unfortunate that so little attention is given to educating the users of lumber as to the best wood adapted for the respective kinds of work. A shoe dealer would not sell a laborer a patent leather light soled shoe for work in the swamps, or a heavy built boot to use on a dance floor. God in his wisdom gave us the forests to use wisely and judiciously. When, therefore, you sell a quick decaying wood for exposed work you are helping to mould public opinion and make the buyer believe that lumber is no good for a durable job and further lead him in the straight road to try something else but lumber. We know that proper lumber of a proper grade will withstand the ravages of time as will nothing else at an equal or higher price. We point with admiration and reverent to old homesteads of wood that have stood for fifty or seventy-five years, yes, a hundred years, and are still inhabited. Have you heard of a modern metal sheathing that will stand ten years without paint every six months, or a plaster or composition board that can beat a 7/8-inch ceiling for wear, a cement floor in a basement that will not be cracked, concave or convex in ten years? A floor on cedar or white oak sleepers with proper ventilation will last twenty-five years. A shingle roof will last thirty-five years in the country or sixteen to twenty years in the city. Show me a composition that will hold up one-half as long. Put up your galvanized bucket against the old oaken or cedar bucket. We dote on antique furniture; it was built to wear and we cherish it. How long will steel cases last after they get dented and the lacquer off? Would our descendants cherish it? Yes, and this metal furniture is finished to imitate wood. How complimentary. I might continue indefinitely, but the foregoing is illustrative for my purpose.

Advertising a wood so as to compel a dealer to keep a duplicate stock of woods for a like purpose does not create a demand. It simply creates a displacing of one kind of wood for another. We must unite. That is, manufacturers, be they of yellow pine or white pine, cypress or hardwoods, fir or spruce, oak or maple, in an effort and with the yards must place before the public and architects the fact that timber is still to be had in ample quantities for all demands; that there is a reasonable priced lumber for any purpose. How to attain this end can be best developed by the thought of lumbermen the lumbermen themselves. In the way of a suggestion I would say that for a long time I have spoken of woods products shows or exposition to be projected and put on in big centres to educate the public mind to the use of wood. Its economy, its durability when the proper kind is used for the proper places. Show that proper construction can make wood buildings safe or nearly so from conflagrations. There is no doubt that more fires are created by lax building laws than from the reason of wood products being used. These shows could clearly demonstrate what it wood take good literature years to impress, but do not understand me to mean that good, convincing, truthful literature and paper exploitation is not effective or needed, but it should be supplementary to the more forceful methods of practical work. The recent fire of the Equitable building in New York has demonstrated forcibly that as long as we need combustible things in them, such as paper, cloth, carpets, leather, oils, curtains, books, etc., even though all the furniture was built of steel, the possibility of fire exists just the same, and expansion of heat may mean entire ruin of a building.

If a campaign as outlined should meet with favor it should be worked upon the broadest of lines. There must be a more get-together spirit between manufacturer and retailer to accomplish the purpose. The best interests of the manufacturer are served through the retailer who dispenses the product to the community. The sterling worth of an article is always backed up by the good name of the firm or individual in his community who sells it.

I believe the matter worthy of thought and nothing would please me better than to have our association take the initiative to agitate the matter.

This saving, and the fact that it is annually, was one—and in truth—the leading inducement, for one of the large Canadian Box Factories to order a 12-foot Linderman Automatic Dovetailer.

The saving does not stop at the above figures. When you look at your immense edging waste have you ever wondered how it can be reduced? The Linderman method can help you.

When you figure that 1000 board feet yields you only 750 feet of matched shooks, have you asked yourself,

can it be bettered? It can be; the Linderman method does it.

What is the Linderman method? It is simply common sense,—the joining together of several pieces of equal length lumber, of miscellaneous widths into a panel that is several inches wider than the width desired. This piece is then passed through a sizing saw, ripped to width and the edging which is several inches wide is passed back through the Linderman Dovetailer and joined to another panel.

### The Results Obtained are :-

1. A composite panel of the required width made up of two or more pieces so firmly joined together as to make a piece as strong, or stronger, than one-piece stock.
2. The ability to use narrow width lumber, working it so cheaply as to yield a profit of several dollars per 1000 board feet over any other method.
3. Effecting a considerable saving in the edging waste, reducing to a minimum the waste of lumber to make the tongue and groove.
4. Reducing the amount of stock lumber in the yard of the various widths, so absolutely essential by the old method, making a saving of money invested in stock and interest on the investment.
5. Conservation of all resources, capital, labor and lumber.
6. Improving the appearance and bettering the quality of your finished product.
7. Profits—known and accessible.

[illegible]

On analysis, it appeared that every board used was handled by the yard crew, was planed, was cut up by the swing saw men, was fitted, was matched and was trimmed. Every bit of our output, with almost no exception, passed through these stages, and the same crew handled it all. We realized that the fitting was the key to the progress of an order through the mill. Some orders naturally cost more per thousand feet for fitting, and likewise in proportion for all the other processes mentioned above. Theoretically, it costs the same to handle any 1,000 ft. of lumber as it does another thousand, and the same may be said of planing, though possibly there might be a variation according to width and length. Actually, however, if it takes longer to cut up and fit the lumber for a given order, it costs more to plane it because there is the same crew get-

## Nice Point to Worry Over

The cost of labor fitting a certain order: (is to) the whole cost of fitting for the day: (as) (x) the cost of 2 for that order: (is to) the total of group 2 for the day. Find  $x$ .

"Say how carefully the wood that is used in your interior trim, window sash, doors and other mill work is selected; how it is stored and seasoned; how it is examined when it comes to the saws, and

how the inferior pieces are rejected. Tell them with what pains the material is worked, and how each man has before him, not the task of getting out so many thousand feet a day, but getting out the work in the best possible way.

"In other words, make your advertising mean something; make it interesting. Tell the public about your plant as you would tell me if you wanted me to know what good stuff you are making. Put the human interest note in it, and, if your product comes up to specifications, as I believe it will, you can sell all you have to offer at a better price than you ever dared make before.

"And, by the way, don't try to hog all the space with that moniker of yours. Just because you own the mill is no sign that everybody in town likes to see your name spelled out. Interest them in what you have to say, and your name will take care of itself."

A good deal of this sounded like sense, although some of it was theory that the planing mill man didn't understand. However, he decided to take his friend's word for it, so he tried to tell, in a simple but effective way, just why he thought he ought to have public patronage. He went into some of the details suggested, and he was surprised to note that in the street cars and other public places people were turning to the page on which his "Building Talks" were appearing. He had arranged to get the same position every time his copy appeared, and, though he had intended running it only two or three times a week, he finally found it worth while to have it appear every day during the building season.

Then the contractors and architects began to call him up oftener and to consult him about details of the work which they had never thought it worth while to take up with him before.

"Smith, the fellow who's building this house," one contractor said, "told me to get the mill work from you, so I suppose you'll have to make it, though I told Mr. Smith it would cost more. He seemed to think that you turned out better stuff than anybody. Of course, your work is fine, but I didn't think the public would ever specify planing mills in planning to build its residences."

After that sort of thing had continued for some time, the mill operator found that he could hardly devote as much time as necessary to preparing the copy for the newspaper ads. he was running, so he hired a bright young man in the advertising department of one of the dailies to get up the "dope" for him. The latter was taken through the plant, and the ideas that the owner had were explained to him.

With the enthusiasm of youth he jumped into the work and turned out copy that was really interesting and effective. The space used by the firm was increased, at his suggestion, during the heavy building months, to rather large proportions, but during the fall and winter it dropped down to a point where it sufficed merely to keep the name of the institution before the public during the period when it was thinking about building, but not doing much work in that direction.

"I've come to one conclusion," said the wood-worker one day to a friend who had originally advised him as to his advertising efforts, "and that is, the public is interested in business.

"When I first began to advertise, it was with the idea that even the people who read my advertisements would say, 'Oh, that's only an ad.' But it didn't take me long to discover that they read them and thought about them—and sometimes believed them! I myself, I must admit, had always regarded the advertising in the papers as money thrown away, or, at best, an expensive method of letting you and me know that Jones has a clothing store at First and Market. But now I know that if you have something really worth while to say, and say it in an interesting manner, the public will listen to you.

"A man's home is probably the place to which he gives most thought, when it comes to the material that goes into it, and the appearance which it has. Even the builder who expects to rent or sell the structure realizes that these things are big factors, and can be made to see the dollar-and-cents value of having the stuff up to the mark in all respects. So, after thinking it over, and getting my arguments well worked out, so that I could express them properly, I found I didn't have much trouble in convincing people that they ought to pay more attention to the quality of the wood work which is going into their homes.

"We haven't been able to get prices so high that we could throw our cost system out of the window, or raise the wages of everybody on the place 100 per cent., regardless, as my colored cook says. But we have been able to get a price that meets the quality of our goods and that enables us to put our effort into turning out the very best work it is possible to produce, without worrying about whether the price we get for it will be anything like the amount we are putting into it.

"And as for the men in the mill, whose ability and thoughtfulness and careful workmanship are making a name and fame for our firm—well, you couldn't persuade me that it's good policy to employ cheaper crews."—The Wood-Worker.

## A Machine Woodworking Study in Birch

Birch, as a valuable article in furniture making, is also a study fit for the brightest and most experienced mechanic. First comes the selection of the timber, which must be of the same age, growth and the same degree of dryness.

In no other timber must such care in drying be taken, as the wood in itself is of a nature which absorbs moisture very rapidly, causing it to warp in almost every direction.

For example, a top that is of glued-up stock will warp on the joints from the simple process of gluing. A top made in this manner must be sanded to a perfectly even surface before working on any further. At this stage a straightedge should be laid on the top, and tried at every point until it lies absolutely level at all points.

## A Legacy for the Finisher

After this top has left the woodworker and gone to the finisher, the trouble has started in earnest. If stains are applied with the brush, they should be of sufficient strength in order that they may be applied as lightly as possible. Flowing on with the brush, one side at a time, will warp a top before it can possibly be turned over and applied to the other side. A dip tank for stain is preferable, as it comes nearer coating the article at the same moment, causing both sides to draw against each other, holding each piece absolutely square.

Not long ago the writer was called in to see a stand top which had warped enough to loosen one leg and tighten up on the holding of the other three until the entire structure was as dilapidated as an old strawstack after a Kansas cyclone had struck it. Now, the question arises, where was the trouble?

On investigation, I discovered that in selecting the narrow boards forming the top little care had been exercised in selecting pieces of the same growth. A straight-grained piece had been glued to one of curly nature, and on the other side of the curly piece another straight-grain had been applied, the grain running in the opposite direction. It will be readily seen that when the top began to age something had to give.

## Corners Curl of Boards

Again, on this same top all the finish had been applied to the top and nothing to the under side, causing a reflex action in each board, which resulted in a corner curling up like smoke in a March wind. Too many manufacturers put all their effort and expense in the woodworking department, leaving so small a margin to the finisher that the finish is really a detriment to their work.

The question may arise in the mind of the reader what would be the correct method of procedure in getting out a top of this kind. In answer, I will give my own ideas from the experience gleaned in about fourteen months' work with birch.

First, see that your wood is dried and cooled exactly the same. After drying, cooling and cutting up the proper length, select the pieces and pile them on a truck, so that each board of the same nature and growth will be assembled in the same top.

When the pieces are sent to the matcher the same care must be taken, as a good many tops go wrong in matching as well as anywhere else.

Now, we are ready for the glue-room. Here the glue must not only be of the proper thickness, but the heat of the room ought also to be of the same temperature, or a little more than the top has been subjected to in the dry-kiln. I have seen hundreds of pieces of glued-up work go wrong from gluing in a cold room. Glue joints need to be dried as rapidly as possible to prevent water absorption by the wood.

## Planing, Sanding and Staining

The planing and sanding can be done the same as in other tops, except, as previously stated, it must be brought down to a perfect surface. After shaping and finishing the edge and applying the rail as desired, this top is ready for the finishing.

In staining, the best results are obtained from dipping, which gets all parts covered at practically the same time. In this I refer more especially to colors using water or spirit stains. Oil stains are not so liable to warp as are the others.

After the stain has dried sufficiently, a coat of shellac applied on both sides is next in order. This will prevent any absorption of moisture. If one coat of shellac does not sufficiently fill the pores, apply two, as shellac is considerably cheaper than warped tops that are returned from dissatisfied customers. After this, finish can be applied as desired on the top side only. Birch worked in this manner well, will prove out O. K. in nine cases out of ten.

You will see from the foregoing that the writer is not a believer in a good hot dry-kiln and a shop cold enough to make the men hustle to keep warm. More manufacturers lose from the abuse of first-class dry lumber than they do from any slowness of the woodworker. —Wood Craft.

# CAMP DEPARTMENT

## Life in a Lumber Camp

By R. O. Sweezy

For physical endurance, diligence and skilfulness in all kinds of labor there is none to surpass the Canadian shantyman. Even the Indians cannot teach him more than he already knows about how to utilize the varied resources of the forest or adapt himself to his surroundings. Give him an axe and a few matches, drop him from a balloon into the wildest forest of the North and he will at once proceed to the satisfying of his wants, absolutely confident of successfully extricating himself from his unenviable position.

In tracing the history of the shantyman through the romantic legends of the *conte de conte* the impression is left that those of his early lumbering days were of the roughest and most formidable character—physical giants with whom the shantyman of the present day would be but miserably contrasted. From truer though less romantic sources it is found, however, that those old bush-whackers could chop no more logs in a given time than the present-day lumberman. The converse of this is also true, in spite of the belief that modern improvements have altered every kind of work. In fact, the whole system of log making is, with few exceptions, the same to-day as it was some sixty or seventy years ago, but the demand for small logs in pulp making has in a measure altered the conditions of transporting logs.

The "old timers" used to live all winter on pork and beans, peas, bread and molasses. Tea was a costly luxury which the extravagant user had to pay for at exorbitant prices, to be deducted from his wages of \$8 to \$12 a month. In the centre of their log shanty was a huge fire, used for cooking as well as to assure warmth and comfort in the bunks, the smoke escaping through an opening in the log roof. But in the modern lumber camps operated by the lumber or pulp and paper companies every consistent luxury in the way of food and warmth is provided. In the long winter evenings the men gather around the great camp stove to listen to some old shanty veteran recounting the legendary tales of the ancient *coureurs de bois*, the voyagers, the "Wendigo,"\* the "Chasse Gallerie"† or the herculean and daredevil exploits of the early shanty days.

These men are probably the most healthy and vigorous men in the country. Born or reared on the frontier, they take their hard times as a matter of course. For a man to carry a 200 or 300 pounds load on his back across a portage is to them a very ordinary feat, while they can travel all day in rain or cold water and slush with an 80 pound pack, and at night, with a few dexterous strokes of the axe, throw up a "lean-to" of fir boughs, all the time being in the most jovial mood.

With such men as these log making is easy, but in order to make the logs cheaply, and thus take advantage of such skilfulness and energy, the management of pulp mills should give out to them all their log making by contract. Many new companies object to this method, preferring to establish their own carefully studied and elaborate system of camps, roads, teams and day labor. But one season usually suffices to prove the inferiority in point of cost of their system to that of the French-Canadian jobber. In the jobber system the company gives contracts for the season's cut of logs to one or several responsible men, who in turn sublet the work in small contracts to the habitant jobbers and such men as have horses and are adapted to the work.

The company, if it owns limits, may cut their logs on these or buy by contract from farmers scattered along rivers or railroads; but our methods are often adopted, obviously to save the timber on the limits of the company.

The duty of the company's forestry superintendent is to know the limits thoroughly in order to determine upon the policy to be pursued in the annual operations. He will therefore determine the locality and area of operation for each season's cut. He must know how many logs the area will yield, the conditions of operating, the cost of improvements to rivers for log driving, the storage requirements for the drive and how to place head contractors and jobbers so that lumbering may be carried on in the most economical way.

The superintendent supervises operations in the forest to pre-

vent wasteful cutting, and also to see that jobbers shall cut and haul the logs that are far from the river as well as those that are easy of access.

According to law no trees smaller than 7 inches in diameter on the stump may be cut, and in cutting year by year on different parts of the limits the portion lumbered on is allowed to grow up again, so that under natural conditions it will be ready to yield another cut twenty to forty years later.

The jobber goes into the woods in September or October with some of his sons, or, lacking these, a couple of hired men or boys, and one or more horses, often taking with him also his wife and small children. He builds his abode of round logs, the spaces between them being well stuffed with moss, so that with a good wood pile at hand the small shanty is at least warm and snug if not bright and airy. The same kind of a shanty is built for the horses, though often the small jobber, with his wife, children, one or two hired men and his horses are all sheltered under the same roof, with a peek-a-boo partition to keep the horses from promiscuously trampling on the children. In a few such camps the horse is not put to this indignity, but is allowed to enter by the same door and share the same one room abode with the human occupants, probably being assigned a stall adjacent to the foot of the two storey bunk, so that he may, if he wishes, back up to the full length of his halter to warm his limbs by the stove, which he not infrequently makes a mess of.

Being able to work well under such economical conditions, the jobber is favorably equipped to compete with the company camps, where high wages and good living prevail. Besides, with his "bobsleighs" and "grand-sleighs," he can with facility make roads to every part of his allotted area. These roads and trails all lead to a main or trunk road, which in turn leads directly to the "rollways" on the river banks. The frozen ground and abundance of snow make it easy to build these roads. Enormous loads can be drawn over such roads on runner sleighs, since the natural slope within a river valley or watershed is always toward the river.

A good axeman will chop about 100 logs of 12 to 16 feet in a day. The logs are strewn along the various roads, where they are picked up by the teamsters and drawn to the rollways on the river banks. With the disappearance of the snow in the spring the logs are rolled down the sloping banks and into the river, thus starting the log drive, which may be only 10 miles long, or perhaps, as on the Ottawa River, 150 miles to the mills.

The skill and daring of the French-Canadian driver or riverman is proverbial. His hours are from starlight to starlight, for every second of daylight must be utilized while the flood is on. Often in the front of a great jam of logs on the crest of a roaring rapid a picked few of these drivers will work like madmen to break the jam, until suddenly, perhaps, the great mass of 40,000 or 50,000 logs is started—slowly at first, but quickly gathering speed by reason of the rush of water from behind. The brave fellows, canthook in hand, are now nimbly jumping and side-stepping to reach safety while the cheer of the thirty or forty men on the rope gang ashore is but faintly heard above the rumbling and crashing of the mass of logs.

In driving large rivers into which the smaller streams carry their burden of logs the dangers which the men have to face are many, drowning and other accidents frequently occurring. Oar boats of the flat-bottomed pointer type especially adapted for rough rapids and portages are sometimes swept over impassable rapids or falls, drowning some or all of the crew. It was on the Quinze River near the headquarters of the Ottawa River some years ago that a boat crew of seven was swept over the famous "Devil's Chute." Attempting to reach a small log jam on a rock above the falls the boat captain soon found that he had miscalculated the velocity of the current. The most desperate struggle with the oars, and the most expert wielding of the 9 foot paddle by the steersman held them for a few minutes against the awful current, but soon realizing the futility of further effort they all stopped rowing and passed calmly to their doom before the eyes of their comrades on shore.—Paper Trade Journal.

Following on the recommendations of the conservation commission the Dominion Government will set aside \$110,000 to be expended this year on the new Rocky Mountain forest reserve. The Minister of the Interior will appoint a forestry expert, to take charge of the reserve, which is 600 miles long and anywhere from thirty to sixty miles wide. It is likely that a part of the reserve will be set apart for the preservation of Canadian animal life.

\*The Wendigo—An evil spirit of the forest whose doings are enshrouded in mystery.

†The "Chasse Gallerie."—"In the days of the 'old regime' in Canada the free life of the woods and prairies proved too tempting for the young men, who frequently deserted civilization for the savage delights of the wilderness. These voyageurs and coureurs de bois seldom returned in the flesh, but on every New Year's Eve, back through storm and hurricane—in midair—came their spirits in ghostly canoes, to join, for a brief spell, the old folks at home, and kill the girls on the annual feast of the Jour de l'n, or New Year's Day. The legend which still survives in French speaking Canada, is known as 'La Chasse Gallerie.'"

# WANTED & FOR SALE DEPARTMENT

## PUBLISHERS' NOTICE

Advertisements other than "Employment Wanted" or "Employees Wanted" will be inserted in this department at the rate of 15 cents per agate line (\$2.10 per inch) each insertion, payable in advance. Space measured from rule to rule. When four or more consecutive insertions of the same advertisement are ordered a discount of 25 per cent. will be allowed.

Advertisements of "Wanted Employment" will be inserted at the rate of one cent a word, net. Cash must accompany order. If Canada Lumberman box number is used, enclose ten cents extra for postage in forwarding replies. Minimum charge 25 cents.

Advertisements of "Wanted Employees" will be inserted at the rate of two cents a word net. Cash must accompany the order. Minimum charge 50 cents.

Advertisement must be received not later than the 10th and 26th of each month to insure insertion in the subsequent issue.

## WANTED—LUMBER, ETC.

No. 1 and No. 2 Hemlock and No. 1 White Pine Mill Culls. Send list of what you have to Box 445, Canada Lumberman, Toronto, Ont. 5

## Saw Logs Wanted

Red and White Pine, Hemlock and Spruce. Write in particulars of what you have. Reid Bros., Bothwell, Ont. 2-7

## White Pine Wanted

3 in. x 6-in-7-in. 18 ft. Tank Stock, also Quarter Cut White Pine Pump Squares.

Ontario Wind Engine & Pump Co., Ltd. Toronto, Ont. t.f.

## Lumber Wanted

Large quantities of Soft Elm Lumber, 1-in. and grades No. 1 common and better. Especially attractive prices.

J. S. FINDLAY, Owen Sound, Ont. 2-7

## Wanted

WANTED—Birch, maple and poplar logs, No. 1 butt cuts. Delivered Montreal from March to May, 1912. State sizes and lowest cash price to E. J. H., B34 Board of Trade, Montreal. 4-5

## Pickets Wanted

We want at once and during 1912, 4/4 x 44 in. and 48 in.; 5/4 x 44 in. and 48 in.; 6/4 x 44 in. and 48 in. White Pine, Spruce, Basswood or Poplar Squares. Will buy a car or your entire output. 4-9 Box 58, Ogdensburg, N.Y.

## Lumber Wanted

Will contract with a few hardwood mills for their entire cuts, 1912, including culls. Highest prices paid, and quick shipment. Also open for dry stock of all kinds. Also Spruce and Hemlock. Apply to Box 414, Canada Lumberman, Toronto. 2-5

## Wanted

Responsible contractor with good portable sawmill, capacity about twenty thousand per day, to take contract for four years to cut from three to five million feet per year of pine and fir timber situated on railway line in the interior of British Columbia.

Dominion Lumber & Timber Co., Ltd., 212 Winch Building, Vancouver, B.C. 5-6

## Spruce Wanted

We can use short Spruce 4/4-in. and 5, 1 in., in 2/5-ft. and 6/11 ft. Describe what you have to offer, and give lowest price delivered here.

THE RATHBUN COMPANY, Deseronto, Ont. 3-5

We want to purchase a quantity of dry Maple, Elm, Basswood and Birch, and also contract for the present winter and coming spring cuts of Hardwood lumber. Address, The London Lumber Co., London, Ont. 4-7

WANTED—Hemlock or pine lumber in exchange for a five passenger fully equipped McLaughlin-Buick Automobile, thoroughly re-built and re-finished this winter and in good road condition. Price \$800. 4-5 Box 303, Oshawa, Ont.

## Pine or Spruce Wanted

Wanted; million feet pine or spruce 1 x 4 and up shorts, 1911 or 1912 cut. Quote price delivered and state when you can commence shipment.

ZIMMERMAN BROS., Tavistock, Ont. 5-8

## Sawdust Wanted

Two cars per week coarse sawdust for delivery at Chippewa, Ontario, via Michigan Central Railroad. State price per car and freight rate.

NORTON COMPANY, Niagara Falls, N.Y. 5-8

WANTED—Three or four cars No. 1 Hemlock in sizes 2 x 8, 10 and 12 from ten to sixteen feet long, dry, about equal per cent. of all lengths, also a couple of cars cedar posts, 4 1/2 up tops, 8 feet, dry, peeled.

Apply Box 195, Jordan, Ont. 5

## White Ash Wanted

We are in the market for the following White Ash:—

100,000 ft. 1 1/2-in. (Dry size) plank.  
50,000 ft. 2 x 2 x 32 in. dry size.  
25,000 ft. 2 1/4 x 2 1/4 x 32 in. dry size.  
50,000 ft. 2 1/2 x 2 1/2 x 36 in. dry size.  
Reply, The B. H. Piper Company, Manchester, N. H., U. S. A. 4-6

# Hardwood Wanted

3,000,000 feet Hard Maple, Soft Elm, Rock Elm, Beech, Birch, Basswood, Ash, Oak, and Soft Maple, for delivery, shipping dry during 1912. Sawed to our sizes. State what you have to offer and lowest prices for spot cash. Inspection at mill. Apply Manufacturer, Box 401, Canada Lumberman, Toronto, Ont. 1-8

## FOR SALE—LUMBER, ETC.

## Hemlock For Sale

12,000 feet 3 x 8, 10-16 ft. No. 1 Hemlock.  
22,000 feet 3 x 10 10-16 ft. No. 1 Hemlock.  
1,700 ft. 3x12, 10 & 12 ft. No. 1 Hemlock.  
3,000 ft. 3x12, 14 ft. No. 1 Hemlock.  
12,000 ft. 3 x 12, 16 ft. No. 1 Hemlock.  
Will make a close price for prompt shipment.  
The Elgie & Jarvis Lumber Company, Ltd., 18 Toronto Street, Toronto. 5

## For Sale

The following Special Stock;—  
1,000,000 ft. Scant 2-in. Spruce Random.  
300,000 ft. 1-in. Spruce Mill Culls.  
50,000 ft. 6/4 and 8/4 White Pine Mill Culls.  
100,000 ft. 1-in. 6 to 9 ft. White Pine Shorts.  
100,000 ft. 1-in. Fourth Quality or Box White Pine.  
All dry and can be shipped promptly by rail.

THE A. SHERMAN LUMBER CO., Potsdam, N. Y. also 50 Church St., New York City 2-t.f.

FOR SALE—In June, cut to order, twenty cars common grades of Birch. Reply Box 447, Canada Lumberman, Toronto, Ont. 5

## For Sale

1-in., 1 1/4-in., 1 1/2-in. and 2-in. mill cull White Pine in strips and sidings. Fred T. Smith, Board of Trade Building, Montreal. 1-t.f.

## For Sale

Two carloads White Oak Timber in round six to ten inches diameter small end. Eighteen to thirty feet long.

ROBERT LIGHT, Napanee, Ont. 3-5

## For Sale

18 M. feet 7/8 x 2 1/2 and 3 inches wide hardwood flooring, T. & G. and dressed, kiln dried, at \$20 per M., f.o.b. car; 12,000 feet 3 inches dry hard maple, No. 1 C. & B., 80 per cent. 1st and 2nds, at \$35 per M., f.o.b. car. For quick shipment. Address Box 442, Canada Lumberman, Toronto. 5-6

## FOR SALE—MACHINERY, ETC.

## Pine Lumber and Timber For Sale

We have 15,000 pine logs 12 ft. and 16 ft. lengths, 5 in. and up diameter, which we are prepared to saw under contract into squares or lumber as desired. Correspondence invited. The Pearce Co., Limited, Marmora, Ont. 5-tf

FOR SALE—Sawmill, in good condition, on Burford Lake, six miles from Wiarton, equipped with 70 H.P. boiler, 60 H.P. engine, new carriage by Long Bros., Orillia, good trimmers and endless chain attachment for hauling logs out of water.

Terms, etc., apply Massey-Harris Company, Toronto. 4-T.F.

Sawmill for sale, together with outfit, consisting of a 65 H.P. Ames Locomotive Type Boiler; a 50 H.P. Vim Engine, 12 x 15, in first-class condition; also a No. 1 Lane Sawmill; a Lane Pony three-saw Edger; Connell Lath Machine and Bolter, together with Butting Saws; also Pulleys, Shafting, Belting, and Tools. Will sell for cash or take payments in lumber. If interested address Box 433, Canada Lumberman, Toronto, Ont. 4-9

## Machinery For Sale

A Waterous No. 4 Band Saw Mill, with Carriage Saws, Live Rolls, and complete Filing Room equipment, also several Good Woodworking Machines, in splendid condition.

J. S. FINDLAY, Owen Sound, Ont. 2-TF

## Relaying Rails For Sale

12 miles 56 and 60 lb. per yd. with fish plates. 10 miles 80 lb. per yard with angle bars. 4 miles 65 lb. per yard with fish plates. Also 12, 16, 20, 25 and 50 pound. New, light rails, all sections, in stock.

JNO. J. GARTSHORE, 58 Front St. W., Toronto. 5-6

## For Sale

One Gang Circular Sawing Machine (Kendall patent) good as new; run only 18 months. This machine carries nine 32-inch saws, takes from 4 to 10-inch cants, can be set to cut one to three inch stock.

Reason for selling, cut out. For price, write Jas R. Gillies, Arnprior, Ont. 24-5

## Going out of Lumber Business:

1—24-in. Timber Planer.  
1—15-in. Heavy McGregor & Gourlay Match-er.  
2—12-in. Cowan Stickers, New.  
1—40-in. Cowan Band Saw, with Re-saw attachment.  
1—Self-Feed Rip Saw.  
1—26-in. Cowan Double Surfer.  
1—Pipe Bender.  
1—Rope Drive Equipment Complete.  
Dry Kiln Trucks.  
6—Lumber Waggon; single.  
1—Lumber Lorry; team.

## For Sale—Saw Mill and Plant

Machinery and everything complete, situated in one of the best lumbering towns in Minnesota. Best facilities for everything. This is a bargain. For particulars address, Box 443, Canada Lumberman, Toronto, Ont. 5-6

## Saw Mill For Sale

On Georgian Bay, adjacent to North Shore, good two-storey circular mill in good running condition, double edger, trimmers, capacity about 12,000 feet per day; plenty timber available and ready sale for slabs; splendid opportunity for small millman; will be sold cheap as owners have other interests requiring their attention. Box 444, Canada Lumberman, Toronto, Ont. 5-TF

## Saw Mill Property For Sale

Saw Mill Property at Ford River, Michigan, consisting of three band saw mill, shingle mill, tie and post mill, lath mill, docks, and trams, blacksmith shop and machine shop all stocked with tools, large store and office building, large boarding house, large barns, sixty-three houses, lands, etc., all of which will be sold at a bargain. Apply to The I. Stephenson Company, Wells, Delta County, Mich. 3-6

## Machinery For Sale

Carver, 4 spindle, Rohman.  
Cut-off saw, railway, wood frame.  
Dovetailer, Boults.  
Engines and boilers, various sizes.  
Floorer, 9-in. Berlin.  
Jointer, chair seat, Jenkins.  
Jointer, 16-in. White.  
Moulder, 6-in. Houston.  
Mortiser, Smith.  
Mortiser, Bit.

Planers, 24-in. single belted.  
Sander, double 24-in. Perry.  
Sander, three drum 42-in. Boardman.  
Sander, three drum 42-in. Columbia.  
Saw Gummer, Rogers.  
Saw-mill, band, 63-in. wheel.  
Saw and dado machine, Williamsport.  
Variety Lathe, Pringle & Brodie.

O. L. PACKARD MACHINERY CO., Milwaukee, Wis.

## WANTED—MACHINERY, ETC.

WANTED—Second-hand Steam feed, 7 in. by 36 feet long, complete with fittings. Must be in good repair. Reply, Box 432, Canada Lumberman, Toronto, Ont. 4-5

## Alligator Wanted

Wanted an alligator boat, in good condition. Reply, giving condition size, age, equipment, price and situation. Box 405, Canada Lumberman, Toronto, Ont. 2-5

## Lumber Trucks Wanted

Wanted 75 good two-wheel Lumber Trucks, either new or second-hand. Must be good heavy trucks to carry 6,000 pounds each, with wood wheels, 3-in. or over tires. Write the undersigned, giving full particulars.  
Bathurst Lumber Company, Ltd., Bathurst Village, N.B. 5-6

## WANTED—EMPLOYMENT

Advertisements under this heading one cent a word per insertion. Box No. 10 cents extra. Minimum charge 25 cents

Band Saw Filer wants position for coming season. Single or double cut. Twenty years experience. Address Box 413 Canada Lumberman, Toronto. 5-6

A.I. Band Sawyer wants position for the coming season, right or left hand. A.I. reference. Address Box 448, Canada Lumberman, Toronto, Ont. 5-6

WANTED—Position as Office Manager or Head Bookkeeper in Lumberman's Office, fourteen years experience in similar position in Montreal and British Columbia. Highest references. Age 42; total abstainer. Country position preferred. Moderate salary. Address New P. O. Box 83, Montreal. 5

As Band, Saw Filer, double or single cuts, or in a factory where there are band saws. First-class references. Reply Box 422, Canada Lumberman, Toronto, Ont. 3-5

Band or Circular Sawyer open for engagement for coming season; 14 seasons' experience, also filer on round saws. Reply J. M., 26 Westmount avenue, Toronto. 5-6

Position as bush manager. Have had fifteen years experience. Strictly temperate and can furnish best of references. Reply Box 446, Canada Lumberman, Toronto, Ont. 5-6

As Engineer in Sawmill or Woodworking Plant, long experience with Corliss and other engines; steam feed and setworks, niggers, dynamos; have certificate, reference and tools. Will go anywhere. Reply Box 452, Canada Lumberman, Toronto, Ont. 5-6

WANTED—Position as bookkeeper with lumber firm in Ontario. Twelve years' experience, mostly as office manager; age 34 years. Acquainted thoroughly with all departments of lumber office. Best of references furnished on application. Apply Box 399, Canada Lumberman, Toronto, Ont. 1-8

Position wanted with lumber company, planing mill or kindred institution by man who understands the business from tree to finished product. Years of experience as accountant, manager, etc. Could handle branch office or similar work and do it right. Toronto preferred, but any location considered. Box 439, Canada Lumberman, Toronto. 4-5F

## WANTED—EMPLOYEES

Advertisements under this heading two cents a word per insertion. Minimum charge 50 cents

WANTED—Energetic Lumber Salesman to handle our stock on commission basis. The Southern Lumber & Boom Company, Cincinnati, Ohio. 5

WANTED—Suitable parties to install and operate small sawmill on limit, New Ontario. Communicate with Box 437, Canada Lumberman, Toronto, Ont. 4-5

Millmen wanted, millwrights, edgemen, trimmerman, engineer, round saw filer. Lath mill men and lumber pilers. Mill will start as soon as ice clears in spring. Apply giving experience, etc.. To Dymont Mickle Lumber Company, Whitney, Ont. 4-5

WANTED—Good reliable party capable of taking management of our lumber manufacturing plant, or preferable one able to take charge of office and store management. To such a party able to invest enough to make them well interested in the business a good paying position would be given. Address Box 450, Canada Lumberman, Toronto, Ont. 5-6

## BUSINESS OPPORTUNITIES

Partner wanted, sleeping or active, with \$10,000, to manufacture small articles from hardwood. I have a ten-year contract in my pocket for all I can produce. Fifty per cent. profits, unlimited quantity of suitable timber. Don't answer unless you have the cash. Box 378, Canada Lumberman, Toronto, Ont. 5-t.f.

### Timber Limits For Sale

Can be quickly and profitably disposed of by advertising them on this page. This is where buyers of timber property look for opportunities to invest, if your "ad" is here the investor will see it. Canada Lumberman, Toronto, Ont. tf.

### For Sale on Georgian Bay, Ontario

400 square miles of timber limits containing over 300,000,000 feet of pine, hemlock, spruce, cedar, basswood, birch, etc., and a vast quantity of the timber, also a sawmill with a capacity of 100,000 feet per 10 hrs. Price and terms very reasonable. Write for full particulars to E. Stewart, Forest Engineer, Room 11, 84 King Street East, Toronto, Ont. 4-6

### Planing Mill and Sash and Door Factory For Sale

Modern in every way, machinery, building, heating, dry-kilns, etc. Would consider proposition to run same from practical man who could take full charge and would invest some money as evidence of good faith and ability. Factory could be converted for use of other industry if wanted.

For complete description of plant apply Box 430, Canada Lumberman, Toronto, Ont. 3-TF

### Timber Limit For Sale

Timber, British Columbia Coast, sworn estimate 214,000,000 feet. Price only \$75,000. Correspondence solicited. Westminster Trust & Safe Deposit Company, Limited, New Westminster, B.C. 5-6

### Timber Limit For Sale

Ninety-three square miles of spruce tamarack timber, estimated at 297,000,000 feet B.M., along the Carrat River, Saskatchewan, for \$275,000. \$75,000 down, the balance on terms. For particulars write John Anderson, Box 661, Saskatoon, Sask. 5-8

### For Sale

Established Lumber Business, with first-class mill, now running full time. Timber limits with 20 to 30 million feet of standing pine timber conveniently located, and all merchandise, etc. Price \$55,000. This is worthy of investigation. Address Box 332, Canada Lumberman, Toronto, Ont. 19-22-t.f.

### Given Free

Water with electric power and situation for plant to manufacture hardwood furniture and chairs. Will enter partnership with any man who has proved himself capable of success in the furniture and chair business, either one or both, will also finance the enterprise. Chas. T. White & Son, East Apple River, Cumberland Co., N.S. 5-8

### For Sale

170 ft. 1 in. good basswood short, 2 to 5 ft.  
11 M. ft. 1 1/4 in. good basswood short, 2 to 5 feet.  
14 M. ft. 2 in. good basswood short, 2 to 5 feet.  
50 M. ft. 1 in. M. C. Ash.  
50 M. ft. 2 in. M. C. Ash.  
GEO. C. GOODFELLOW,  
Montreal, Que.

## Canadian Timber Limits

### E. STEWART (Forest Engineer)

Dealer in Timber Limits, Ontario and Western farm lands and town property. Excellent investments now open. Correspondence invited. 84 King Street East, Toronto. Phone Main 5609. C

### Planing Mill, Saw Mill and Heading Mill For Sale

This is one of the best equipped Planing Mills west of Toronto, doing a prosperous business. Heading and Saw Mill in good condition; considerable timber to be had; will sell all or will sell Planing Mill separate. This is a going concern; no better proposition anywhere; a money maker. Will stand the strictest inspection. Can give satisfactory reason for selling. Reply to Box 417, Canada Lumberman, Toronto, Ont. 3-t.f.

### For Sale

Mill and Plant situated on Bay Lake of Montreal River and within the town limit Town of Latchford on T. & N. O. Ry. Plant consists of one Boiler, 60 in. diam. by 14 ft. long, full flush front and rated at 70 h.p. Right Hand Engine, 12 in. x 16 in., estimated 64 h.p.

Three Moreau Machine Pulpwood Barkers and Pullup and all saws, shafting, belts, etc., including extras.

Siding of T. & N. O. Railway runs into mill yard; good storing point for logs. With very little extra cost, a circular saw and carriage could be installed as the power is sufficient. This plant has been in use about 10 months only and is in good condition. An excellent bargain for the right parties. Write or communicate with C. & H. D. Gamble, 28 Scott street, Toronto, Solicitors for Owners. 2-7

### Valuable Timber Property For Sale

The Oromocto Lumber Co., Ltd., ask for tenders for their property. (Tenders to close on or before 3rd day of April, 1912), and to be mailed to Mark Curry, Amherst, N.S., marked "Tenders for Property of the Oromocto Lumber Co., Ltd."

This property consists of about 74 square miles of New Brunswick Government land and about 5,783 acres of granted land, and about 30 acres of leasehold land, situated on the branches of the Oromocto River and estimated to contain sixty to seventy millions of logs, spruce, fir, pine and hardwood, and one hundred millions of pulp wood; property contains mill, five houses, barns, camp outfits, seven horses, rigging, etc.

The lumber cut off this property is available for shipment to either the United States or the English market as mill is on the line of the C. P. Railway, rate of freight to Boston points 14c.; St. John 3c.

This property is well situated to be operated cheap, and logs or sawn lumber produced at a low figure and is without doubt one of the best properties of its size in Eastern Canada.

Full particulars with regard to the property, etc., may be obtained from Mark Curry, Amherst, N.S.; Frank H. Lowe, Brooklyn, Queen's County, N.S.; William E. Golding, St. John, N.B., or the Oromocto Lumber Company, Ltd., Central Blissville, N. B. 3-6

### For Sale

Heavy portable saw mill with single edger, also Leonard Eclipse boiler and engine 35 h.p. Mill now running in first class order. Situated near Delaware Village. For further particulars apply Geo. A. Patrick, Delaware, Ont. 5-tf

### Water Circulation in Steam Boilers

If the circulation of the water in a boiler is slow and poor it cannot be a rapid and economical steam raiser; and, at the same time, poor circulation is one of the causes of unequal expansion and the consequent deterioration arising therefrom. Also the tendency to incrustation is increased with boilers having a poor circulation. With a rapid and unimpeded circulation the bubbles of steam formed are quickly carried to the surface, and the different parts of the boiler are kept at a fairly equal temperature, thus avoiding unequal strains, which are extremely detrimental. In conjunction with a free circulation the water should of course be kept to a steady level, and the stoking be regular and uniform.

If the water circulation in a boiler is slow a considerably increased time is, of course, necessary to get up steam.

With the object of increasing the heating surface and improving the circulation of the water a considerable number of Lancashire boilers have of late been constructed, with the addition of a series of horizontal tubes running the full length of the shell. These have been found to considerably increase the steaming capacity of the boiler, and where the feed-water is fairly pure are very well suited for sawmill purposes.

### Decrease in Maine Spruce Trade

An incident among the changes that have taken place in the supply of and demand for different kinds of lumber in the United States is illustrated by what has occurred in the Maine spruce trade during recent years. It is stated from New York that a decline in the demand for Maine spruce began in the metropolitan district about four years ago, and since has continued with fluctuations in volume, from time to

time. The falling off in requirements has been felt severely in the past two seasons. Time was when the bulk of the 3 in. stuff went to the metropolitan market, and large cargoes of heavy spruce were disposed of there readily. Last year Boston was the better market. It is now a question as to whether New York will ever again be a great market for Maine lumber. It is thought probable that the principal reason for the falling off of demand for Maine spruce is the competition of southern pine, including the long-leaf variety of the Gulf region and short-leaf and North Carolina pine. Thus it is seen, remarks the "American Lumberman," that the great southern wood has successfully invaded northern markets from the Great Lakes region to the Atlantic coast, even having become a severe rival to eastern spruce and northern hemlock.

### Sawing Accidents

Wood being thrown from the saw is the most dangerous feature of circular sawing, says a correspondent of The Timber Trades Journal. All connected with circular sawing should study and learn as much regarding the nature and quality of woods as they do the mechanical manipulation of the machine. Almost all fatal accidents caused by circular saws—and such are many—can be attributed to the wood being thrown from the back of the saw, and certainly this dangerous possibility could be obviated if the operator knew his business as he ought to do. Great care should be observed while cutting 'proud' stuff, especially flatwise. The wood should not be unduly forced against the saw, and a wedge ought to be immediately inserted in the saw kerf behind the saw when possible. Probably larch is the timber that is most liable to jam the saw in this respect, but fatal accidents have occurred with other kinds of wood as well. It may be said that guards will not avert danger or prevent accidents when sawing 'proud' timber, so the only remedy is to draw the wood back several times until the wedge can be inserted.

## Saw Mill To Let

with Water Power and Lachine Canal frontage, near St. Gabriel Locks. Stone building, etc., in good order. About 75,000 square feet of land is to let with the mill.

Well situated near Notre Dame and Canning Streets. Possession 1st of May. Property of estate of A. Cantin. Apply to

**The Cradock Simpson Company**

BUSINESS ESTABLISHED 1879

205 St. James Street, MONTREAL

# Review of Current Trade Conditions

## Ontario

A good demand continues at Ottawa and in Eastern Ontario for both the high and the low grades of white pine. Based upon these conditions the general belief is that a good season's trade can be expected. Whatever change there has been in market conditions during the last few weeks points in the direction of improvement. The lower grades have continued to advance in price and the middle grades are holding their own. The building outlook at Ottawa and in its neighborhood is excellent and the belief prevails that during the present year there will be more extensive building operations than ever before. Woods operations in the Ottawa Valley have been favored with better weather of late than during the earlier part of the year, with the result that it is now believed that the output of the camps will be about as large as was at first expected.

In central and western Ontario the lumber trade continues on a firm basis. The leading feature is red pine. There is also a good demand for hemlock and the prices are strong, as stocks in the retailers' hands and at the mills are reported to be low. White pine is steady with a good demand for practically all grades. Lath are firm although the demand has not yet reached more than moderate proportions.

The output of hemlock in the Georgian Bay district this winter is likely to be much smaller than usual. One of the government rangers who is closely in touch with the situation reports that the hemlock output will fall far short of last year's. As yellow pine does not compete seriously with the short hemlock logs, it is possible that the reduced output will result in an improvement in the price situation this year. A prominent Toronto wholesaler reports that all the indications at present are in favor of a satisfactory year's trade for Ontario lumbermen.

## Eastern Canada

A serious car famine is holding back trade in Eastern Canada. Reports from Montreal state that there are plenty of enquiries and orders but that the lumber cannot be transported from the mills. Stocks in general are reported to be low, particularly dry stocks of spruce boards. Trade with the United States is dull. The hardwood trade is active and prices are firm. The retail trade shows about a normal amount of business in progress for this time of year.

The severe weather checked the trade in eastern spruce, at Boston, materially. Frames have been moving slowly. No sales are recorded at anything under \$24. A few dealers have secured \$24.50 for small lots. The asking price is still \$25, among those manufacturers who have plenty of orders on hand. A good demand continues for random and prices are steady. From \$21 to \$22, is the price of 2 x 4, though some holders are not accepting anything lower than the latter price and no one is trying to force sales. No change is reported in hardwoods, at Boston. A quiet trade continues in quartered and plain oak, with prices steady. The demand for maple is fair and ash is quiet. Hemlock boards are rather quiet, with offerings of dry stock light. Holders are standing firm. Eastern clipped boards are held at \$20, and \$20.50 is occasionally obtained when frames are included in the order. The trade in shingles, at Boston, is light but prices are unaltered. The best extras are bringing \$3.60 and clears are quoted at \$3.25 to \$3.35. Lath are quiet, the asking price for 1½ inch being from \$3.90 to \$4, and for 1½ inch \$3.50.

## Great Britain

The period of cold weather which was experienced throughout Great Britain recently caused a considerable interference with the lumber trade. This, however, was only temporary, and the trade quickly revived when the better weather arrived. In the London market at present, spot buying is rather quiet and forward buying is on moderate lines. About the only consuming branch showing decided activity is the packing trade. Uncertainty in connection with freight rates, together with the present high prices, have had rather a depressing influence upon future business. Prices continue firm, both for floorings and deals, but forward prices are uncertain. At the present time orders can be secured only by making a concession to the buyers.

Messrs. Churchill & Sim, in their monthly report, write as follows:—

"There has been a quite unusual importation of wood into London during January. Last year it was large, this year it is larger still, and a belated importation of this sort, coming after the business of the year is supposed to be finished, and cutting into the small remaining close time which is all that is now left to importers, has a quite disproportionate adverse effect not only on the London market itself, but also on all other markets, including the important one for

free-on-board selling for the new season, which is in full swing at this time of the year. Of this extra importation some 4,500 standards have been delivered overside in excess of January last year, but the dock deliveries are 600 standards less than they were in the first month of 1911. The dock stock may be estimated at nearly 15,000 standards less than it was twelve months ago. Prices for deals and battens are perhaps a point better than they were before Christmas, but for other things, including flooring, the market has been unsatisfactory throughout the month, with a very poor demand. The free business which was running in December for forward shipments during the new season has slackened off considerably in January. Shippers are very independent in consequence of the large sales already made, but further sales require much pushing and negotiations as the orders come along, both sides appearing to be genuinely indifferent. Much less than usual has been sold to this country, and the prospects seem in favor of quiet, steady, unsensational selling without variation in prices. Freights are opening higher than they were last spring, and seem likely to continue on the basis of about a 10 per cent. rise."

The deliveries at London docks for the week ending February 3rd amounted to 3,771 standards, as compared with 3,809 during the corresponding week of 1911.

At Messrs. Churchill & Sim's recent auction sale, 3 inch first class Quebec birch brought 1s. 6d. per cu. ft., and 1s. 5½d., and prime unsorted Oregon 4 inch sold at 1s. 6d., 3 x 11 and 9 inch of the same quality sold at 1s. 4½d.

At Liverpool the timber trade has been deterred considerably by the difficulty in obtaining freight room. The demand for tonnage is still very strong, not only for lumber but for cotton and wheat. Steamship owners are asking 50s. per standard, for f.o.w. Maramichi, to good ports in the United Kingdom. From St. John, N.B., 45s. per standard is asked to Liverpool. Reports state that no business has yet been transacted at these figures and that both sides are playing a waiting game. It is hoped that the freight situation may be cleared up somewhat as spring advances. Considerable anxiety is still felt at Liverpool and in the neighboring parts of the country, about the unsettled condition of the great industries, there being apparently no end to the unrest among the labor classes.

Spruce deals are very quiet, not only on account of the lack of building operations but also as a result of the heavy frost and of the unsettled condition of the freight market. Stocks at Liverpool, in wholesalers hands, were nearly 1,000 standards less at the end of January, than they were a year previous. Of the stocks on hand at Manchester docks, 9,740 standards, nearly one-half was held by consumers in storage.

The demand for hardwoods at Liverpool continues strong and difficulty is experienced in filling orders for favorite sizes and qualities. Great difficulty seems to be experienced in obtaining deliveries of hardwoods ordered from the United States, on account of the shortage of cars in that country and also on account of the shortage of vessel space for the transatlantic shipments. Prime, plain white oak boards are in good demand. The supply of medium and better stocks is small but the demand is dull. Ordinary medium stock in one inch boards is about the cheapest timber on the market at present. The demand for thin oak seems to be very quiet but an improvement is expected before long. The prospects are for a good demand in the near future for medium cabinet oak planks, as a result of the high prices for wagon and coffin oak planks.

At Manchester, the weather had the same effect upon the timber trade as in other parts of the country. The prospects for the immediate future, however, are bright. A slight improvement is noted in the building trade. Retail prices of timber, at Manchester are considered far too low. It is difficult in fact to characterize them by any other term than ruinous. This is hard to account for, when one considers the high prices which retailers now have to pay when they come into the market for stocks. Oak of all kinds with exception of the very low grades is scarce and higher in price. Railway companies are reported to be coming forward with numerous enquiries. Some improvement is noted in the supply of railway wagons for timber freight, though there is still a considerable shortage.

## United States

No important changes are to be recorded in the lumber industry and trade of the United States during the past two weeks. A gradual improvement however, is noticeable in most parts of the country. The extremely cold weather kept the enquiries for spring trade from developing materially. The soft weather of the last week or two has made an important difference and improvement is reported. Generally speaking there is a firm belief that the spring will witness

J. M. DIVER, Gen'l. Mgr.  
E. C. BARRE, Ass't. Mgr.

an important increase in the demand for lumber, though it is just possible that this development may commence a little later than expected. Retail stocks are rather low and the same applies to stocks in the hands of consumers both in soft wood and hardwood. The prevalent buying of small and mixed orders shows no indication of change and the opinion is that only a decided advance in prices will stir retail dealers to any other method of business. Retailers, especially those of pine are still inclined to hesitate about buying very far in advance of their immediate requirements. The most important demand for northern pine, is reported for the lower grades which can be used in box manufacturing. Supplies of this class of lumber are only moderate. Higher prices for lumber are only moderate. Higher prices for low grade white and Norway pine are not unlikely in the Saginaw Valley district.

Chicago.—The lumber trade has shown no noteworthy changes, during the past fortnight. Weather conditions have been opposed to any increase in demand. Retailers however, have been buying in fairly large quantities during the last week or two, as their stocks had been permitted to run down, since last fall. A fair number of orders are reported for northern pine and the volume of trade is considerably greater than a year ago. Prices are firm in all classes of northern pine. The hardwood market is steadily improving and a general feeling of optimism prevails. The principal demand is for plain red oak which is strong, though rather scarce in the grades that are most desired. Quartered white oak is in a little better demand than formerly. A fairly active market for ash is reported. Furniture manufacturers are enquiring for birch a little more than formerly. Hemlock boards are quite strong in demand and stocks of dry lumber are low. Southern pine for railroad timber and car construction continues in good demand at Chicago. The prospects are, that this will be the case for some time. Early spring buying has developed well. An active and stronger market is confidently expected. Manufacturers are holding out for good prices and an upward tendency is expected during the spring. Shingles are dull, although receipts from the coast have been reduced. The demand is extremely light. Lath are in steady demand and firm.

Buffalo.—A good demand still continues for the best grade of northern pine, for pattern purposes, and stocks are comparatively light. Building lumber has been quiet, on account of the severe weather. The demand for box lumber is good and more strength is evident in the market. Hardwoods have been rather quiet, on account of the severe weather. Plain oak, maple and birch are in good demand and prices are firm. The trade in hemlock is small, as building operations are light. An improvement is confidently expected with the approach of spring. Stocks are light and in some grades are quite low. Prices are firm and likely to continue so. They have in fact increased about 50c. a thousand, of late. A good demand continues, for North Carolina pine, as a result of the difficulty in securing stock for immediate orders. The main difficulty has been in the delivery. Prices are steady. Southern pine continues strong and mill representatives are expecting higher prices, on account of scarcity of stock. Shipments are arriving slowly, as cars have frequently been held up during the last fortnight. Sales of red cedar shingles have been smaller than usual. A better demand is expected shortly. A feeling prevails that the demand for Canadian white cedar shingles will be good, during the year. Prices are steady.

Bay City and Saginaw.—A steady market continues for the best grades of northern pine and the trade in the lower grades for box making is also good. Stocks of box lumber are low. Coarse grades are worth more than they were a year ago and there is a little fluctuation in the price of high grade pine.

### Timber Trade in Barbados

S. P. Musson, Son & Company, Bridgetown, Barbados, report under date of January 19th, regarding the lumber trade as follows:—"There has been no arrival of any description of lumber during the fortnight. Dealers' yards are fairly well stocked with both white pine and spruce, and further supplies are expected. Pitch pine—Last sales \$33.50 for merchantable (all heart) and \$26.50 for second quality, and we understand further contracts have been made in the neighborhood of these prices. Shingles—No arrivals of either Gaspe or cedar laying, for both of which there is a fairly good demand. Shooks—No arrivals. Wood hoops—Receipts consist of 1,510 bbls. by the S.S. "Caroni" from London, on importer's account.

### Port-of-Spain Markets

Gordon Grant & Co., Ltd., Port-of-Spain, report upon the trade in lumber and cooperage materials, under date of February 5th as follows:—"The only arrivals are the s.s. Trym from Gulfport with 207,000 feet pitch pine, and the small cargo of N. S. boards by the Schooner A. V. Conrad from Liverpool, N.S., to our consignment, which we disposed of on arrival at satisfactory rates. There is always an outlet for this class of lumber and a small lot of spruce

boards would sell well. A cargo or two of good heart quality pitch pine assorted in accordance with present requirements could be disposed of.

## Market Correspondence

### Montreal Trade Hampered by Car Shortage

Montreal, Feb. 24.—The outstanding feature in the Montreal Trade is the scarcity of cars, with a consequent temporary dislocation of business among wholesale lumbermen. The complaints concerning the car famine are universal, and the head of one firm states that he has never experienced such a shortage at this time of the year. In some instances flat cars have been utilized, and even in many cases where box cars have been employed they belong to foreign roads. There are plenty of inquiries and orders, but the lumber cannot be transported from the mills, and the orders are thus unfilled. This delay involves considerable expense, and there is naturally a good deal of grumbling.

Generally, stocks appear to be low. This applies particularly to dry stock, and notably to spruce boards. Dry stock has been almost cleaned up, and the situation is aggravated by the impossibility of getting whatever lumber of this description is at the mills. Export business to the United States is dull. Hardwoods continue in fair demand, and while dimension lumber is quiet, prospects are reported to be very good.

In the retail business the volume of trade is about normal for the season, with spruce lath in better demand. It is yet too early for any pronounced demands, but retailers are looking forward to a very satisfactory season.

### Pulp and Paper Mills Busy

With regard to the paper and pulp situation, there is very little change to report. The mills are very busy, and while a lot of paper is expected from the new mills, this will come gradually into the market during the summer and fall.

In ground wood there has not been much movement into the United States, (except on contracts) until recently. A sale of 2,000 tons by a Canadian mill to a Northern New York point is reported. It is expected that prices will advance materially within the next week or two. The streams in the Province of Quebec are low, and production may be limited on this account.

Chemical pulps are very high in price and scarce, owing to the extraordinarily strong demand from the United States during the present winter.

The question of "the most favored nations" seeking free pulp and paper admission to the United States, owing to the concessions made to Canada under recent tariff legislation, is still before the United States customs court. The general opinion appears to be that European nations cannot be placed on the same plane as Canada, and that the tariff will remain in effect against Europe as it is to-day. The chances seem that the small concessions made to Canada will not be changed.

### Improved Prospects at Ottawa

Ottawa, February 24.—The lumbermen of the Ottawa Valley are confident, as a general rule, that the trade conditions this spring and throughout the coming season will be much more satisfactory than during the corresponding period of last year.

Senator Edwards, of W. C. Edwards & Co., reports that "there has been little change in the outlook during the past few weeks, but what change there has been has been since the New Year has undoubtedly been for the better." This hopeful view of the situation is shared by the majority of the lumbermen. They point out that the highest grades still command top-notch prices, and are likely to maintain their strength indefinitely. The middle grades command practically the same prices as have obtained for some time. In common lumber, however, prices are stiffening appreciably. In mill culls, pine box boards, and shorts there has been a continued steady advance in price as a result of the strong demand. In fact, while this is a slack season in the lumberman's calendar, the medium and lower grades have been selling rather freely.

### Building Activity Still Increasing

The Canadian trade outlook appears to be bright to the local dealers. Already the building figures of the various cities of the Dominion are being compiled and in practically every instance the large total of last season's building operations will be surpassed. In the immediate vicinity of the Capital an active spring and summer is already assured for the building trades, and this of course will directly react to the prosperity of the retail lumbermen, with

an indirect stimulus upon the wholesale and manufacturing branches as well. A keen demand from Montreal is also anticipated, which will still further assure a good season locally.

The United States market continues weak and unsatisfactory. To add to the other perturbing conditions, the presidential elections which are beginning to loom so large on the Southern horizon are given as a reason against being optimistic in that direction.

"The average feeling among lumbermen," as one of the leading dealers expressed it, "is not to go too steep in the United States during a presidential year. Business tends to fluctuate more and more as the time approaches and Canadian lumbermen will be well advised to be conservative in that market."

#### Woods Operations on an Average Scale

While most of the larger firms will not be through their log cutting for some weeks, several gangs have finished their winter's cut. Some hundreds of the log-cutters from the shanties have returned from the north to Ottawa and other centers in this district. Hauling logs is now the order of the day. The sleighing is excellent. This is well, for the winter's operations have been considerably delayed in certain limits; first by the late opening of real winter weather, and then, throughout most of January by the exceptional cold. Some weeks of good hauling, however, have given an opportunity to catch up. Most of the firms, therefore, are counting on the full season's operations as originally planned. This will mean a somewhat larger supply of logs than last winter's normal quantity.

Ottawa lumbermen are hoping that the Dominion Government may enact the bill, recently presented to stop the too common practice of stealing drift logs and timber along the banks of rivers and lakes. "Our logs are being continually stolen by such parties," stated Senator Edwards when questioned as to the need of further legislation. "It must be twenty years since the present amendments were made to the criminal code, to apply to the theft of timber on bodies of water. There is certainly plenty of room for improving the existing law. The trouble has hitherto been that the magistrates would very seldom convict, for if it were enforced even the present law would be pretty stringent. It has evidently been found wanting, and a better means of protecting the lumbermen is sought."

The new Bill, if made law, will make guilty of an indictable offence and liable to three years' imprisonment, anyone who takes possession of or conceals drift timber of any description whatever, or if he removes any mark from the timber or refuses to deliver it up to its rightful owner. Although this seems rather drastic, those best able to appreciate the prevalence of this 'species of thievery' assert that it is in no wise too stringent. It is generally understood that the Parliament will enact the law as proposed.

## Timber Trade in United Kingdom

### Cold Weather Caused Temporary Lull in Trade—Ocean Freight Rates Advancing—Wagon Building on the Increase

By J. Hanmer Quail.

Liverpool, Feb. 11th.—Business in timber has been checked somewhat by a time of keen frost and of unusually heavy snow. London fared better in respect of these visitations than the timber ports farther north, where yard stocks were, for a time, snowed up, and deliveries were suspended as far as might be. Though London had less snow and frost than the other ports, sales from yards were on a very limited scale. At the auction sales buying was fairly active. The lots offered were cleared without difficulty, and prices, in the main, were very firm. More business for forward delivery has been done, and has been viewed as a good feature of trade. Quebec, 3x11, has lately sold at £11, and 3 x 6 at £9 to £9 5s. Floorings have been in good demand, especially 6 and 7-inch widths. Planed boards have been in more request and stocks of these are now very small.

Matchings have been more inquired for and narrow widths have sold readily.

The high freights are interfering with the shipping branch of the trade. For Canadian spruce, from 7s. to 10s. more than a year ago is now being quoted as freight. Sawn pitch-pine has been in moderate demand. The lower grades of the wood have sold more freely but have not brought high prices.

#### Increased Use of Wood Paving Deal Blocks

Blocks for wood-paving continue to be in good demand for use by London borough councils. Among the latter wood-paving operations which have been decided on may be mentioned that of the Richmond Town Council, who have decided to pave Hill street with creosote deal blocks, at a cost of £5,600, and that of the Marylebone borough council who have decided to renew much of the wood pave-

ment of their thoroughfares in the course of the present year and next year.

At Liverpool, apart from the interference with business through the heavy snow, the demand for Canadian lumber has been good and prices tend upwards. Liner shipments of spruce have found ready purchasers at fall prices. The available freight space of the liners have practically all been booked for some time to come. Spruce has sold well and some sizes, 2½ x 7 and 3 x 9, for example, are now very scarce. In pitch-pine, a good spot demand exists, and business is being hindered by the absence of freight space, and the high and increasing rates of freight. Boards meet with a good inquiry and stocks have been much reduced. Birch planks have met with a ready sale. Stocks are still small and prices are very firm. Oak has sold freely, wagon wood being steadily called for and the demand for coffin wood being more active. Boards from 1 inch down to ½ inch sell readily.

At Manchester spruce deals have had a slow sale, partly owing to the quietness in the building trade. Spruce scantlings have been in good demand. Floorings have moved steadily and are somewhat dearer, about £9 15s. now being quoted.

At Glasgow business in pine lumber has been on a fair scale, and more confidence has been shown the trade of the near future. Stocks continue on a much reduced scale. Shipbuilding is still very active and a good demand for all classes of shipbuilders' timber exists. Yellow pine boards for joiners' uses have not been in much request, but the demand from the furniture trade has improved. Oak, elm, canary-wood and red-wood have all been in very fair demand. Prices are firm and tend upwards.

#### Expansion of Wagon Building Industry

Wagon Trade Booming.—Reports of the results of the past year's working by some of the leading wagon-building companies in the United Kingdom have just been issued, and show unmistakably the prosperous condition of the wagon-building trade of late. The Bristol and South Wales Railway Wagon Company, Limited, are paying a dividend at the rate of ten per cent. per annum for the past year. The Scottish Wagon Company are paying a dividend at the rate of six per cent. The Birmingham Railway Carriage and Wagon Company, Limited, are paying at the rate of 12½ per cent. on the ordinary shares, for the past half year. This will leave the dividend for the whole year ten per cent., but a bonus of five per cent. additional will be paid, which will bring the distribution to the shareholders up to fifteen per cent. for the year.

As regards the wagon-building work in hand and the new work being given out, there is no sign of any easing or falling off at the present time. The London and North Western Railway Company have just made a valuable contribution to the work of the kind in hand by distributing orders for the construction of 2,000 wagons among different builders. The value of this work is increased by a stipulation which has been made that the under-frames of the wagons are to be of English oak. A large number of wagons are now being built for other companies, for which oak under-frames have been stipulated, but in some cases Stettin oak has been called for. This large demand for oak, for wagon work is keeping stocks in dealers' hands very small.

The timber trade at Manchester are considering means of increasing their accommodation at the Grosvenor Hotel, where their meetings are held. It is probable that this will lead to the establishing of an adequate timber exchange at Manchester.

#### Moderate Imports at Liverpool

Smith & Tyrer, Liverpool, Eng., in their monthly circular report as follows upon January's trade:—Values have been well maintained during the past month and the moderate importation, coupled with a good demand for the season of the year, have tended to deplete stocks, and in this respect the situation is distinctly sound. The freight question is a difficult problem. It is not easy to get shipments forward from the shipping ports, and owners continue to withhold steamers from the market while more preferable cargoes are obtainable. No immediate fall in rates appears to be in sight. Spruce deals, —Liner parcels have come forward more freely than last year, but, nevertheless, prices have gradually hardened. Shippers are not pressing sales in advance, as the tonnage question continues so uncertain. Birch.—Considerable forward business has been done both in logs and planks and the demand continues. Pine deals—have been steady but without material change. Hemlock—Only a small business is workable.

#### Steady Trade at Liverpool

Farnworth & Jardine, Liverpool, England, report under date of Feb. 2nd as follows:—The business of the past month has been steady; supplies have reached the market in moderate quantities, and although deliveries have been somewhat interfered with by inclement weather, the volume of business transacted on the whole

may be considered fairly satisfactory, and compares favorably with figures for the previous year; stocks generally are moderate.

Canadian Woods.—Pine timber.—Of waney, 1st class, there has been no import. From Manchester stocks considerable deliveries have been made; the quantity on hand is somewhat reduced, and is not excessive; values rule at high points. Of 2nd class timber the stock is moderate, and values steady. Square pine—The demand has been nominal, and there is little enquiry. Oak—There has been more enquiry; stocks are light and values firmer. Elm—There have been no arrivals; deliveries have been fair, and the small stock is firmly held. Pine deals—The import has been very light; there has been a fair consumption; stocks, however, remain ample, both in Liverpool and Manchester; values are firm. Red pine deals—Stocks are not excessive, values unchanged.

New Brunswick and Nova Scotia spruce and pine deals.—The

import to the Mersey (including Manchester) during the past month amounted to 3,970 stds. compared with 1,790 stds. during the corresponding period last year; the bulk of the import having been to Liverpool in liner parcels. The deliveries have been satisfactory, amounting to 7,940 stds. against 5,888 stds. last year; c.i.f. values have hardened to some extent, and the present stock is light; freights continue very firm. Pine deals have been in rather better demand.

Birch.—Logs have not been imported; there has been a moderate consumption; stocks are low, and values firm. Planks have been imported rather more freely, but consumption has kept pace, and values are firm.

British Columbia and Oregon pine.—Imports amounted to 12,000 cubic feet during the past month; there has been a slightly better demand; stocks are not excessive; values firm and unchanged.

# Machinery and Equipment

What Manufacturers of Logging, Sawmill and Woodworking Appliances are Doing

J. A. Fay & Egan Company's No. 291, Automatic Double Cut-off Saw.

## A New Cut-Off Saw

The accompanying illustration represents a new cut-off saw manufactured by the J. A. Fay & Egan Company, Ohio. It is known as No. 291 Automatic Double Cut-off Saw with Hopper Feed. The company claim that this machine will do as much work as eight or even ten of the hand feed machines, at the same time cutting off more accurately than is possible by the slower method.

As regularly made the machines can be set to cut-off up to 6 feet 6 inches long and 20 inches wide. For the wide stock the hopper feed is not used, as the operator can keep the machine filled to capacity without it. For stock 3 in., 4 in., 5 in., 6 in., 7 in., and 8 in. wide, however, the hopper feed is used. The operator picks the stock from the truck by the armful and dumps it into the hopper. The bottom piece always rests upon slides between which runs a chain made of milled steel blocks. At intervals in this chain are steel dogs. These dogs take hold of the bottom piece in the hopper, carry it under the pressure springs past the two saw blades which trim both ends square, and then feed out the pieces to the off-bearer at the rear of the machine.

This chain is practically the entire mechanism of the machine. The chain passes over milled sprockets, preventing any jumping, and each dog has a separate micrometer adjustment, insuring absolute accuracy at all times.

The right-hand housing on this machine is stationary. The left-hand housing, carrying the saw, moves back and forth on wide planed ways, by means of a crank operating through a rack and pinion. The machine can instantly be set to cut-off to any length within its capacity.

Further information can be had by addressing the J. A. Fay & Egan Company, 465-485 W. Front street, Cincinnati, Ohio.

## The Disston Crucible

"The Disston Crucible" is the title of an interesting monthly magazine which has been inaugurated by Henry Disston & Sons,

Philadelphia, Pa. The first issue, a copy of which has reached us, is a most creditable production and promises good things in the future for all who are fortunate enough to be on the mailing list. Among other interesting articles in the first issue is an account of the part played by the saw in history. Excellent illustrations help to make the magazine of value and interest and there is included, a department of correspondence, in which many hints are given which will be of material advantage to millmen. "The Disston Crucible" will receive a warm welcome from the lumber manufacturing industry.

## A Busy Machinery Firm

The Smart-Turner Machine Company, Limited, Hamilton, Ont., report that they have supplied the following equipment among their recent orders: The Grenville Board & Pulp Company, Thorold, Ont., a centrifugal pump, and Cushing Bros., Saskatoon, Sask., a duplex pump. They have received from The Jonquiere Pulp Co., Jonquiere, P. Q., an order for a duplex pot valve pump, and an order for a centrifugal pump for the Dryden Timber & Power Company, Dryden, Ont. They recently also supplied The Toronto Furniture Company, Toronto, with a Simplex vacuum pump.

## Wolves in New Brunswick Forests

A Chatham, N.B., report says that there have been tales from several sections of the province that wolves, practically unknown in New Brunswick woods for many years, have been seen and heard this winter. Two Chatham men state that they saw a pair of wolves recently while in the woods. They had gone to an old camp in that vicinity and were a little distance from it when a savage snarling and an unmistakable wolf howl drew their attention to a place to their right. Two grey wolves then came out in the open and disappeared in the forest.

## EDGINGS

### Ontario

The Canadian Timber & Land Co., Ltd., has been incorporated with authorized capital of \$250,000; Thomas Long, Allan R. Davis, James Playfair and others are interested.

The Parkhill Lumber and Manufacturing Company, Parkhill, Ont., are preparing plans for an addition to their planing mill. They will manufacture small woodenware and will be in the market for a complete outfit of new machinery.

The Thomas Manufacturing Company, St. Thomas, are erecting a wood-working factory at Outremont, Que. The building is to be five storeys, 120 x 50 feet, of mill construction. The architect is E. W. Barnes, 2126 Mance street, Montreal.

The Knechtel Furniture Company are considering the erection of a spring furniture factory to cost \$10,000. The building is to be four storeys, 68 ft. 6 in. x 99 ft. The equipment will include electric motors, elevator, wood-working machinery and sprinkler system.

The Mattagami Company, Limited, has been incorporated with a capital of \$54,000 to deal in timber limits and carry on a general land and building business in all its branches with head office at Mattagami Heights, Ont. The Provincial directors are O. L. Redfern and G. G. T. Ware, Haileybury, Ont.

Parry Sound, Ont., has carried a by-law to give \$25,000 as a bonus and \$25,000 as a loan to the Standard Chemical, Iron and Lumber Company of Toronto. The company intend to erect a charcoal blast furnace of about one hundred tons daily capacity at Parry Sound. The plans and specifications have not yet been prepared.

The Arnprior Box Company, Limited, Arnprior, Ont., whose incorporation was recently reported in the Canada Lumberman, will make a specialty of the manufacture of cheese boxes from wood fibre, which is to be produced from spruce fibre board. The managing director of the company is Mr. Lindsay Whyte, the patentee of the box. The directors of the company are D. McLachlin, president; T. S. Church, vice-president; G. F. Macnab, secretary-treasurer; Neil Campbell and W. A. Whyte and Mr. Lindsay Whyte. The company expect to be in a position to fill orders received in good time for the present season's business.

The Canada Timber and Lands, Limited, recently incorporated, with head office at 84 King street East, Toronto, is a holding company, with an authorized capital of \$250,000. The object is to deal in timber limits, pulp limits, etc. Attention will be devoted very largely to British Columbia timber lands, which it is believed will increase rapidly in price on account of the growing markets in the Canadian Prairies, and the approaching completion of the Panama Canal, which will provide access to the markets of the eastern states. Mr. E. Stewart, forest engineer, Toronto, is one of the principal members of the company.

Allan S. Nicholson, Burlington, Ont., who for eighteen months previous to January 1st last had been carrying on business in connection with G. H. Nicholson under the name of The Nicholson Lumber Company, at Burlington and Hamilton, has bought out the interests of Mr. G. H. Nicholson, and is continuing the Hamilton business under the same name as formerly. He has been carrying on the planing mill and lumber yard at Burlington and the lumber yard at Hamilton under this name. On February 1st he made another change by taking into partnership Messrs. R. Allen and M. Maude, two of the old employees in the Hamilton business. The Hamilton business is now known as The Nicholson Lumber Company and the business at Burlington, which is a separate concern, is conducted under the name of Allan S. Nicholson.

### Eastern Canada

A project is under discussion for the establishment of a large pulp and paper plant at Newcastle, N.B., backed by English capital.

The Chicoutimi Pulp Company has increased its dividend from four to six per cent., the new dividend being payable March 1st. The directors hope to make a further increase during this year.

With the putting into operation recently of the large new machinery, the output of the mills of the New Brunswick Pulp & Paper Company, of Millerton, N.B., will be practically doubled, the capacity of the entire plant now reaching 4,000 tons per annum.

The Wayagamack Paper & Pulp Company has been notified by its European and Australian agents of the closing of contracts which will take the entire output of the company's plant for twelve months after it opens this spring. The contracts, it is stated, have been made at good figures, and will total over 18,000 tons.

The Forest Reserve Pulp and Paper Company Limited has been incorporated with a capital stock of \$1,000,000 to carry on business as dealers in timber, lumber, logs, wood pulp, paper, &c., with head office at Montreal, Que. The incorporators include G. W. MacDougall, L. Macfarlane and J. G. Cartwright, all of Montreal.

J. G. Avard & Company Limited, has been incorporated with a capital of \$100,000 to manufacture and deal in lumber, wood, pulp, timber, &c., to operate saw and planing mills, construct roads, conduits, railways, wharves, &c., with head office at Montreal, Que. The incorporators are G. Mitchell, R. Chenevert, and F. Callaghan, all of Montreal.

Reports from Marysville, N.B., indicate the likelihood of the establishment there of a pulp mill by the Consolidated Pulp and Paper Company, the corporation recently formed with a capitalization of \$5,000,000, in which both English and United States capital is interested. Senator N. M. Jones of Bangor, Me., is one of the principal United States members of the com-

pany. The proposition is to take over the Alexander Gibson Railway and Manufacturing Company, the Edward Partington Pulp and Paper Company, and the St. John Forwarding Company.

The Bayless Pulp and Paper Company have practically completed all arrangements for the erection of a pulp and paper mill at Beupre, P.Q., with a capacity of 100 tons of paper a day. A contract for the supply of power has already been made with the Stadacona Power Company, of Quebec. This company, which recently secured a charter, will generate power from the falls at St. Ferrol, about 25 miles from the city of Quebec. They expect to develop 10,000 horse power. The Bayless Pulp and Paper Company's mill is expected to be in operation about the time the company is developing power.

The property recently purchased by J. L. Black & Sons, Limited, Sackville, N.B., from Arthur A. Hicks, Cooksville, is adjacent to lumber land which they already own; their former holdings lying on two sides of it, giving them in this block about 30,000 acres, all of which they own in fee simple. This block of land is watered by three fair streams; the stream running through the lot recently purchased flows into the Tantramar River and the Bay of Fundy, and the other two streams flow into Northumberland Straits. The new purchase gives them a driving stream on the Sackville side of their property and their shipments from this point will be made over the N. B. & P. E. I. Railway. The larger part of their stock from their original holdings goes to the Northumberland Straits and is shipped from Point du Chene by water to foreign markets and by rail and schooner to the local and United States markets.

### Western Canada

A sash and door factory is being built by A. Cotton at Vancouver, B.C.

Donald Fraser, lumber dealer, Letellier, Man., is reported to have sold to H. McLelland.

The Cameron Lumber Company, 355 Garbally Road, Victoria, B. C., have prepared plans for their new mills and yards.

The British Columbia Government estimate that there is approximately \$200,000,000 invested in timber properties in the province.

The Brookside Milling Company, Limited, has been incorporated with a capital of \$10,000 to carry on business as timber merchants, saw mill owners, &c., with head office at Vancouver, B.C.

The Graham Island Coal and Timber Syndicate Limited has been incorporated with a capital of £13,348, and head office at 815 Bower Building, Vancouver, B.C. A. H. Douglas, barrister, is the company's attorney.

The Western Vancouver Lumber Company Limited has been incorporated with capital of \$400,000. The incorporators are C. Y. Dupont, W. Mawson and F. A. Robertson of Victoria, and F. F. Buckley of Vancouver.

The Crow's Nest Pass Lumber Co. will construct ten miles of standard gage railway next spring near Wardner, B.C. The company already have two sections of railway for logging purposes.

The Western Vancouver Lumber Company, Limited, has been incorporated with a capital of \$400,000. The incorporators are, C. T. Dupont, M. Mawson, and F. A. Robertson, of Victoria, and F. F. Buckley, of Vancouver.

The Western Sash and Door Factories Limited have been incorporated with a capital of \$50,000 to carry on business as timber merchants, lumber dealers, and manufacturers of sashes, doors, &c., with head office at Vancouver, B.C.

Fire recently destroyed the sash and door factory of the McCormick Manufacturing Company, Limited, St. Boniface, Man., entailing a loss in the neighborhood of \$25,000. The loss included over \$10,000 worth of machinery. The insurance amounted to between \$4,000 and \$5,000.

C. T. McAllister Limited, has been incorporated with a capital stock of \$1,000,000 to carry on business as dealers in all kinds of building materials, timber limits, &c. The head office is at Calgary, Alta., and the incorporators are F. C. Moyer, S. C. Gray and G. W. Gallagher, all of Calgary.

Cooke, Peden & Company Limited have been incorporated with capital of \$100,000 to acquire and take over as a going concern the business now carried on by The Northern Lumber Company at South Fort George, B.C., to carry on business as builders, contractors, and general merchants, with head office in the County of Cariboo, B.C.

Reports from B. C. state that the Western Vancouver Lumber Company, which was recently incorporated, will soon commence active operations on their limits on the western side of Vancouver Island. The property includes from 90 to 100 square miles located in and around Nootka, Nitinat and Clayquot, which is reported as all heavily covered with valuable timber. The promoters are Messrs. G. H. and F. V. Robertson, Vancouver, and a large amount of English capital is said to be behind the proposition.

Four hundred million feet of standing timber in British Columbia, located on 10,240 acres have been sold to Henry Carstens, president of Carstens & Earle's. The tract was owned by S. B. Bolom and Elliott G. Cormick and is located on the Salmon River, about 125 miles from Vancouver. The Salmon River divides the tract. The timber consists principally of spruce and cedar with a little fir, and covers sixteen limits of 640 acres each. While the price was not announced, it is said to have been considerably in excess of \$250,000.

The Board of Trade of Kindersley, Sask., reports that there exists at that place a first class opening for a small but well-equipped wood-working plant, capable of turning out the contractors' and carpenters' supplies required there. The town, which is now about two years old, and a divisional point on the C. N. R. Saskatoon-Calgary line, has a population slightly in excess of 800; there are no competing towns within fifty miles in any direction, and no wood-working plant nearer than Saskatoon, 125 miles distant. The town is the centre of a thickly settled district, and a great deal of construction is going on

## The Barnhart Log Loader

has been in successful operation in all parts of the country for twenty years and never caused a complaint. We are now manufacturing a new Barnhart Loader known as Model "12," which is specially designed for use in very heavy timber. This loader is built on the same lines as the old Barnhart Loader now known as Model "10" and which we still continue to manufacture. We are operating lumbermen, producing 200,000,000 feet of lumber per annum and we use the Barnhart Loader exclusively. Could we afford to do so if it were not the best? Write us for prices.

## Purchasers — And How To Locate Them

John Apsley Jenkins sells Hardwood trim. I met him yesterday, plodding along as though headed for the undertaker's. "Deucedly hard work digging up business—made nine calls to-day and not a dollar in sight" he confided.

Now, Jenkins is like nine out of every ten salesmen—spending their time making unproductive calls. They waste much time and good energy canvassing prospects that may want something, somewhere, sometime.

How can this waste effort be eliminated? How can knowledge of present and prospective markets be acquired quickly, efficiently, economically? How can this information be obtained, daily, from every town in Canada?

If you really want to know—drop us a line. Let us send you specimen reports relating to your business and explain our facilities for supplying you, daily, with information that will enable you to make sales.

### The Value of a Forest Survey

An interesting booklet entitled "Forest Surveys; What they are, wherein they serve, what they cost," has been issued by Lyford Clark and Lyford, the well known Forest Engineers, of Montreal, and Clark and Lyford, Vancouver. The booklet is a simple explanation of the manifold advantages involved in the possession of a properly prepared forest survey, for all who are owners of timber limits. These advantages are well explained in a portion of the booklet under the heading, "Forest Surveys,— Wherein they serve," from which the following quotation is reproduced:

"The maps and estimates resulting from a forest survey furnish an inventory of raw material, complete, concise, and fully classified. They provide a usable and convenient vehicle for taking directors and managing officers over the ground, keeping them in close touch with field operations. Maps made by competent forest engineers in such a way that all pertinent information is shown; and which are so drawn that they can readily be kept up-to-date by annual revision (mapping of new cuts, etc.), enable the managing officers to obtain a birds-eye view of their operations—to see at a glance just what and how much area has been cut over; how much is waste land; how much timber is coming from each watershed; the location of routes of travel through the property; the exact location of camps and areas tapped by each one; the location of dams, chutes, and all improvements;—and give them a correct impression of the relation of the various features of the property one to another as regards distance and direction. With the maps and estimates both at hand, general plans for operations can be made for years ahead. Moreover, a distinct advantage is gained for the men who are financially interested in the property, but have no close connection with the management of either the office or field operations. With the aid of an adequate forest survey system, the manager can readily show them in a comprehensive way just what is going on and where it is going on, and what relation the amount of wood used annually and the area cut over bear to the total supply of wood and the area remaining uncut.

"A great many owners of standing timber are holding their property with a view of eventually operating when industrial conditions, extension of railroad facilities, etc., permit them to do so to advantage; or, they may be holding their timber as an investment, aiming to take advantage of the steady and world-wide advance in stumpage values. Most of these owners lack reliable information regarding the actual area and condition of their timberlands. In many cases the boundary lines are not located on the ground, leaving the limits subject to the possibility of being overlapped by limits adjoining. There are usually cruisers' reports on these properties, but they are at best but rough estimates; in very few cases have the areas been systematically covered, and in almost no cases are there adequate maps. These owners can attain a strong position as regards the value of their property by having a forest survey made, thus providing themselves with all essential information thoroughly digested. Along with the forest survey, boundary lines may be established, thereby eliminating all chance of disputes with adjoining owners."

### Car Shortage Holds Back Camp Supplies

Lumbermen and produce dealers have appealed to the Dominion Board of Railway Commissioners for relief in the matter of car shortage. H. K. Egan and E. McLaughlin, prominent lumber manufacturers asserted that the situation was never before so acute. It is said to be nearly impossible to get provisions to the men and horses in the woods and log handling is in danger of suspension. The shipping of manufactured lumber would suffer seriously if the market was brisk, but the trade is rather quiet. The Ottawa Board of Trade sent a protest to the Railway Commission, setting out that within a radius of 100 miles of Ottawa, 7,000 cars of hay lay awaiting shipment. This hay was worth \$1,000,000 and was badly needed in the shanties. It was urged that the older parts of Canada were suffering from the inadequacy of shipping facilities, although the authorities were engrossed with the needs of the western grain men. I. Proulx, M.P. for Prescott, one of the largest hay producing counties in Canada, called the attention of parliament to the trouble and the minister of railways said he would refer it to the Railway Commission. A railway authority ventures the explanation that farmers have a surplus of hay now because they refused to sell before the election on September 21, when there was a chance of reciprocity which would have brought a higher price for hay.

The Northern Pacific Railroad Company is about to place an order for 25,000,000 feet of fir lumber for construction work near Tacoma, Oregon. The Washington millmen see in this the beginning of a period of activity in railway orders, and think trade in general will quickly improve.

## Every Hour Saved on a Job adds to the Working Capacity of your Mill

Will slab opposite sides of a log at one operation, and do it rapidly and perfectly. The machine is provided with two circular saws and improved feeding and guiding mechanism.

Will cut over 3000 Ties in Ten Hours. Will slab opposite sides of logs or bolts from 4½ in. to 20 in. in diameter and 30 in. in length up.

New Tie or Log Sliding Machine

### HERE IS A TIME-SAVING MACHINE

A machine to do special work and do it twice as quickly as any machine in your mill.  
A machine to take care of a small class of timber or bolt work.  
This class of work cannot be profitably manufactured with a band saw or circular mill.  
This new Tie or Log Sliding Machine will do the work—will turn non-paying work into profitable business.  
A veritable money maker—it will extend your trade—it will increase your profits.  
You are a Tie Maker—Think it over.

## Jeffrey Seven Ton Storage Battery and Trolley Locomotive Handling Pulp Wood

Illustration shows the battery in service at a point where the track is not wired.

**Jeffrey Storage Battery Locomotives** are not only the most economical medium for hauling material in Pulp and Woodworking Industries, (showing a net saving of 40% over cost of horse haulage,) but possess many other distinguishing features.

They eliminate the danger of fire incident to the use of steam or gasoline locomotives. Cost of maintenance is very low. Consume power and require attention only when in actual operation. Require no skilled labor to operate.

## THIS TEST REVEALS THE HIDDEN WEAKNESS IN ROOFINGS

All ready roofings—except J-M Asbestos (stone) Roofing—are made of so-called felt composed of animal or vegetable fibres. When these fibres were growing, they lived upon the ground or animal from whence they came, and received their life therefrom. So every fibre of this nature is hollow, like a straw.

These felts are waterproofed with coal tar, asphalt and oil, or other volatile compositions which quickly evaporate when the sun reaches them. Therefore, the sun

quickly begins its deadly work of taking these oils off the surface in such roofings; and then continues to draw them out of the inside through the strawlike fibres of which the felt is composed, until the roofing becomes dry and porous and is no longer waterproof.

J-M Asbestos Roofing is unlike other roofings, because its felts are made of stone fibres which are *solid*. These *solid* fibres defy the action of the sun's rays and positively prevent capillary attraction, thus hermetically sealing all of the oils so they must remain to do their duty indefinitely.

## J-M ASBESTOS ROOFING

is not merely one sheet of waterproofed stone felt, but *several* layers cemented together with nature's wonderful waterproofer—Trinidad Lake Asphalt. This asphalt is also hermetically sealed, making any escape of oils or asphalt impossible.

Prove for yourself that sun will soon destroy the waterproof quality of ordinary roofings. Focus the rays of the sun through an ordinary sun or magnifying glass and not a results. This, in ten minutes, will show you what sun will do in a few months.

This simple sun-glass test is as severe in its way as our famous blow-torch fire test. It will show up the shortcomings of a roofing before you pay out your money.

Because of its stone nature, J-M Asbestos Roofing also never needs painting, and is fire-proof, acid-proof, rust-proof and rot-proof.

# DISSTON CROSSCUT SAWS

RUN EASIEST  
CUT FASTEST  
LAST LONGEST

If you are interested send for our new Crosscut Saw booklet. It is unique, the finest ever printed, for we have endeavored to make it truly representative of Disston High Grade Saws.

When we say Disston Saws run easiest, cut fastest and last longest, it is not a mere advertising phrase—the booklet tells **why**—the saws themselves show **how**.

## HENRY DISSTON & SONS

INCORPORATED

KEYSTONE SAW, TOOL, STEEL AND FILE WORKS

PHILADELPHIA, U. S. A.

BRANCH HOUSES:—Chicago, Boston, Cincinnati, New Orleans, Memphis, San Francisco, Seattle, Portland, Spokane, Toronto, Vancouver.

# 128,350 Laths in Ten Hours

**Five-Saw Lath-Mill**

Our Lath-Mill and Bolter have made a test cut in ten hours of 128 350 four foot Laths, 1 1/2 in. by 3/8 in., counted, tied and piled.

We also make a full line of Lath-Mill and Picket-Mill Machinery, for mills, both large and small.

We also manufacture the following High-Grade Saw-Mill Machinery:—New Modern Saw-Mill Carriages, with either three or two head-blocks; P. Payette's New Patent Saw-Mill-Dog, for use in either winter or summer; P. Payette's Grip-Set Works; Steam Feed Valves, Steam Lifter and Loader Valves. Five different class and style of Edgers, for either light or heavy duty. Combined Gang-Circulars and Edgers, or Independent Gang-Circulars.

Steam-Canters, Steam Lifters and Loaders, and a general line of saw-mill machinery. Detachable Chain-Sprockets. Castings of Gray-Iron, Semi-Cast Steel, and brass castings for general use.

Descriptive Booklet and prices mailed free upon request.

## "MULE-HIDE" TOUGH, TIME-TRIED and TRUE

## SOLD WITH A TEN-YEAR IRON CLAD GUARANTEE

When we are prepared to back up every foot of Roofing sold you with such a guarantee, it surely is up to you, Mr. Lumber Dealer, to investigate. Dealers handling our Roofing find it most profitable, because it means a satisfied customer.

## FOR THE RETAIL LUMBER DEALER

We have planned a local campaign for every dealer who handles our line. It is the most effective aid ever given to dealers, and is entirely new and in advance of anything ever done in this line. It is all planned at our office and done at our expense. It not only helps your Roofing sales but advertises your other sales as well. You owe it to your business to investigate this proposition.

WRITE US. DELAYS DON'T PAY—OUR PROPOSITION DOES.

The DOMINION ROOFING COMPANY OF CANADA, Limited, Toronto, Can.

## Makes It's Mark Vivid and Lasting

Marks that remain vivid and wear like iron are a real satisfaction to the man who handles lumber. The metallic pigments, like graphite, of DIXON'S LUMBER CRAYONS offer marvelous resistance to all kinds of weather conditions. Their marks are often visible after six months of severe exposure to sun and storms.

## DIXON'S LUMBER CRAYONS

have always remained the recognized standard because of their one, uniform and dependable quality; their convenient and uniform shape and size and because of the careful selection of materials used in their manufacture. DIXON'S LUMBER CRAYONS are made in nineteen grades and colors, including black (six grades), red (two grades), blue (two grades), green, white, yellow, brown, terra cotta, violet, pink and orange. Some are made to fill particular needs—let us tell you more about them. Get acquainted.

Write for lithographed booklet No. 239, illustrated in colors.

**HUTHER BROS. PATENT GROOVER OR DADO HEAD**  
For cutting any width groove from one quarter inch to 2 inches or over

Can be used on any Circular Saw Material. Will cut a perfect groove with or across the grain. This is the only Dado Head on the market that gives entire satisfaction on all classes of work. No screw adjustment. For different width grooves, simply remove or add inside cutters. Sold by builders and dealers of wood working machinery in all parts of the United States. Will send on approval, in competition with any other make on the market; if not the best return at our expense. HUTHER BROS., SAW MFG. CO., Inc., 1170 University Ave., ROCHESTER, N.Y., manufacturer of Circular Saws, Morgan Pattern Lock-Corner Box Cutters, Concave Saws, etc.

## Timber Estimates

With increasing values in timber land, accuracy in estimates of standing timber is all important. We are practical foresters and make all estimates according to the most approved methods, assuring the smallest margin of error. We furnish forest maps showing the character and location of timber and the average stand in each, as well as the topography; also the blocking of townships in one mile blocks, a most necessary piece of work in the economic operating of timber lands.

La Compagnie de Pulpes de Chicoutimi  
Chicoutimi, P.Q., Canada,  
August 23rd, 1911.

Gentlemen:—

Replying to your favor of August 11th, would say that we have no objection whatever to your using the name of this company with reference to the quality of your work.

After a careful examination of the maps and reports which were the result of your work on the two hundred odd square miles in question, we take pleasure in complimenting you on their accuracy, neatness and generally satisfactory character.

With best wishes for your success in the future,

Yours very truly,

GEORGE C. W. LOW,  
Manager Woodlands Department  
Messrs. Appleton & Sewall,  
156 Fifth Avenue, New York.

We survey wild lands for the renewal of lines to prevent encroachment and to get actual acreage, the old surveys often being faulty.

We appraise for present and future worth—of particular importance to Bond and Banking Houses in connection with purchases and sales. Our Booklet F, "Applied Forestry," will prove of interest. Mailed upon request.

We are pleased to refer you to H. S. Ferguson, Engineer, 200 Fifth Avenue, New York City; Kathdin Pulp and Paper Company, Boston, Mass.; Bonne Terre Farming and Cattle Company, Bonne Terre, Mo.; Chicoutimi Pulp and Paper Company, Chicoutimi, P.Q., Canada.

## The Fay & Egan "333" is for the Planing Mill Man who keeps ahead of Competition—the Man who Succeeds—

—the progressive mill owner, who investigates carefully before he buys, is the man who is putting in the "Three-Double-Three."

—you have got to come to this fast-feed proposition sooner or later—for your own benefit, the sooner the better.

—and when you do, you are going to buy a Fay & Egan "333" if you give the fast-feed proposition the careful investigation it deserves.

—because the "333" is the most advanced type of Planer and Matcher made.

—it has twenty-eight new and exclusive features, for which patents are being applied, that increase its efficiency 25% over anything heretofore attempted along this line.

—chief among these may be mentioned the construction which permits every adjustment to be made from the outside of the machine, saving many hours of time, and time means money.

—every "333" that has been put out started off without a hitch, and has given increased satisfaction as its wonderful capabilities are being more fully realized.

—for formed work of all kinds we furnish a profiling attachment, fully capable of keeping pace with the planer itself.

—for making bevel siding, we furnish a twin spindle resawing attachment which doubles the number of lineal feet produced by the Planer.

—investigate this machine now, the detailed description and samples of work done at 200 ft. per minute, which we will send upon request, will in themselves demonstrate the superiority of the "333."

—or we will be glad to arrange for you to see a machine in operation.

—don't be a laggard in the march of progress—investigate this matter carefully and you will soon find that you can afford to put in the new "high speed king," the Fay-Egan "333."

Mail the attached coupon now. We want you to know all about the FAY & EGAN "333" whether you are ready to buy or not. It won't obligate you in any manner. Fill it in and mail it now.

### Something New

For nearly 20 years the  
Hanchett Band Saw Swage  
has been on the market.  
There are today nearly three  
times as many Hanchett  
swages on the market as

any other swage. There are over 14,000 of them in use up to this date. They are long lived too, for many of the very first ones made are still in daily use. We have now made an attachment or die lever stop whereby the eccentric die may be adjusted to not turn past the anvil or to turn past the anvil as desired. This attachment will fit on any of the older Hanchett Swages. It is neat, solid and compact. Send for Catalog No. 2.

**HANCHETT SWAGE WORKS, Big Rapids, Mich. U.S.A.**

"HANCHETT SWAGES DO GOOD WORK."

# Make Your Power Transmission An Asset—Not a Liability.

When purchasing Belting don't come to conclusions quickly—the selection of a poor cheap belt might mean considerable loss of power and efficiency in your plant.

**Beardmore Belting** will save you this trouble and loss—it will also wear better and last longer than any other belting on the market.

**Beardmore Belting** represents the maximum value obtainable in leather belting.

Made only from extra selected No. 1 Packer Steer Hides—tanned under the slow old fashioned process which positively ensures the long life of the belt.

Having everything under our supervision from the hide to the finished belt we are able to offer Leather Belting that we can fully guarantee.

# INDUSTRIAL LOCOMOTIVES

It is important for you to know what a locomotive will do to justify its cost.

It must pull the required load, start it and keep it going.

It must provide just the right amount of the right material in the right place.

Each and every part must be sure to fit not only the locomotive of which it is a part, but every other locomotive of the same size and design. Every operation must be made in fixtures or to templates compelling accuracy of manufacture so that the

machine will not be idle at a critical time for necessary repairs or renewals. Spare parts must be instantly available, made so well as to go into place without a machine shop.

Visit our works and see how all this is accomplished.

# Horizontal Slab Resaw

Built in Two Sizes

These resaws are compactly built and are supported on the floor line so they do not need a special foundation.

Both upper and lower feed rolls are driven which gives a powerful and uniform feed.

We also manufacture Hopper Feed, Box Board Resaws and many other Hopper Feed Machines for box factories.

We solicit your inquiries.

**Mereen-Johnson Machine Company,** MINNEAPOLIS, MINN.  
U. S. A.

# MAPLE LEAF SAWS

The Improved Racer Cross Cut Saw, by Actual Test, is the Fastest and Easiest Cutting Saw Made

The Maple Leaf saw is higher priced than the ordinary saw because it costs more to make it. It is made of the very highest quality of steel and tempered by a secret process which toughens and refines the steel. The Maple Leaf trade mark on the saw means that it is the equal, if not superior to any saw made. It also means that you are privileged to test it against any other make and if not found equal or superior in quality you can return it and have your money refunded.

The ambition of the manufacturers of the Maple Leaf Saws has always been to produce the best tempered saw in the world and they are constantly investigating and experimenting with this end in view. They have recently made some valuable discoveries in evenness of temper. It has always been difficult to get a perfectly even temper on long and thin sheets of steel, such as saws are made of. Our recent discoveries make this an absolute certainty. Every user of saws should bear in mind that the temper of the saw is its most valuable quality. High finish and attractive appearance amount to nothing if the temper is not right.

All Maple Leaf Saws are Guaranteed to be Perfect in Temper

**Shurly-Dietrich Co., Limited** Galt, Ontario

# Shimer Cutter Heads and Cutters!

The "Shimer Limited" Cutter Heads with Expansion, Figs. 627 and 628

These Heads have self-centering and spindle-gripping features that will interest you. The Bits carry a larger areal surface and are set at an acute angle for fast cutting. Price, net, for Flooring \$72.46 the set complete.

## The Making of a Cutter Head

Demands years of experience, the employment of materials that use and experience have shown to be the best for the purpose, and a clear understanding of the needs of the mill man. Only in buying from those who have made the manufacture of Cutter Heads a life study can these demands be met, or is there certainty of getting a thoroughly reliable, dependable and efficient tool.

The man who buys Shimer Cutter Heads, buys with his outfit the assurance of a lifetime of accurate service—a guarantee that he is going to be satisfied with his purchase.

Shimer Cutter Heads are designed so as to be practically indestructible. In addition only the highest grade of Steel Forgings are used in their manufacture, consequently they give long service and perfect satisfaction, doing their work without calling for constant attention and continual repairs.

Shimer Cutter Heads will save more actual time and money in the mill than any other single tool you have. They make the work more agreeable for the operator, more profitable for the employer and are guaranteed to pay for themselves in a few months' use. They are simple and easy to operate, strong and durable, reliable and economical, offering a solution to many difficulties that come up daily in the mill.

We have perfect faith in the ability of the Shimer Cutter Head to "make good," hence we make them to your order to fit any matcher or molder and send them on trial to responsible mill men anywhere.

Let us know what your requirements are in the way of Cutter Heads or Cutters, We guarantee satisfaction on everything we sell

Let us hear from you today!

## Popular Cutter Heads

The most popular of The Shimer Cutter Heads are Figs. 202 and 203. The Bits are held within conical duplex bit seats, self-centering, arranged with the very complete Expansion feature for the fine adjustment of tongue and groove thicknesses.

Price with 4 bits to each head, the set . . . \$40.95

Price with 6 bits to each head, the set . . . 49.27

Price with 8 bits to each head, the set . . . 57.60

Complete with Flooring Bits. The Heads will also receive Bits for thin Ceiling— $\frac{3}{8}$  at \$1.30 each and Bits for 2-in. thick plank at \$1.63 each.

## Jointer Heads

For jointing plain edges we make several styles of Jointer Heads provided with shearing effect to produce the easiest and at the same time the smoothest work. Made of Steel Forgings they supply the strongest and best. Our very reasonable prices put the tools within the reach of all.

Price, with 4 bits to each head, the set,  $1\frac{1}{4}$ -in. \$31.20

Price, with 4 bits to each head, the set, 2-in. 33.28

## Ship Lap Heads

to give you the best service must be of a kind that is always ready and to interchange with matcher and other Heads you may have fitted to your machine, thus avoiding a change of machine guides. This is one reason why the Shimer Ship Lap Heads are so generally used. The other reason is that they do work so satisfactorily that all who know their convenience take them in preference to others.

Price, with 4 bits to each head, the set,  $1\frac{1}{2}$ -in. thick, \$34.84

Price, with 4 bits to each head, the set,  $2\frac{1}{2}$ -in. thick 35.88

## Double Ceiling Heads

These heads have a special design to suit the purpose of double tonguing and grooving, with overlapping of the bit cutting edges to produce perfect clearance and to protect the leading points from unnecessary friction and wear.

They double the capacity of any matcher or moulder and provide a means of turning out single surfaced ceiling or flooring upon the most economical basis.

Price, Double Ceiling Heads complete with Bits, net, \$40.94

## Door, Sash and Coping Tools

That save all the hand fitting. No changing of patterns, therefore, no trouble in framing the door and sash parts when they are matched up with the Shimer Cutter Head. We relieve you of that detail of the business when we place the mould in counterpart within the contour of the Bits. The Bits are filed only to sharpen and being set by means of a gauge give accurate and uniform results. Prices very reasonable.

## Reversible and One Way Cutters

The Shimer Reversible Cutters for Single Spindle Shapers, Variety Moulders or Friezers, are carefully moulded opposite to the shape of the mould to be produced, in such a way as to have only the cutting edge touch the lumber. They are complete—inexpensive—time saving. We also make One-Way Cutters for the Double Spindle Shaper.

## Thin Steel Knives

Advanced ideas referring to the planing and surfacing of lumber have developed into the use of the thin blades, made from high speed steel, which when properly tempered and treated, serve for one or two days of work on hard maple, oak or hickory.

These blades are known as our Bedee Knives and are recommended by users as the best that can be procured. For the benefit of those desiring to use this style of a knife we have facilities to furnish them in any length or thickness.

Write us about your requirements.

**No. 300 Heavy Duty Inside Moulder**

The advantages of a Moulder and a Planer and Matcher are combined in the machine illustrated above. Ease and speed in adjustment are insured through special unique features, not contained in any other type of machine. The method of lubrication is perfect. The general construction is after the plan of the planer and matcher, having heavy sides connected by heavy girths which in combination with a series of platen plates form the bed.

**No. 300 Heavy Duty Inside Moulder**

The special features of this model machine include truing devices for top, bottom and side heads, which insure all knives doing an equal amount of work. Six speeds are furnished through friction feeds. Top rolls are made with pull-out shafts, and extra rolls are supplied, all interchangeable. Matcher frames swivel, ample expansion for all bars and chipbreakers. Made in two sizes 15 x 6 and 12 x 6

## A CLARK OSCILLATING STEAM NIGGER

Tooth bars are of refined machine steel.  
 No cast steel or cast iron filling.  
 They taper and are practically unbreakable.  
 Notice cross tie at base of bar.  
 Cylinders oscillate on steel trunnions.  
 Valves are large and areas ample.

All valves ground perfectly true.  
 Piston rods are extra heavy.  
 They never spring or bend.  
 Pistons all packed with double snap rings.  
 Speed controlled by throttling plugs.  
 Spring cushion floor plates with steel buffer blocks.

Parts are cast in the cylinder avoiding leaky joints.

We build every machine required in an up-to-date Band or Circular Saw Mill

Designed for rope or steam feed. Bulletin 107.

## Frame

The frame is built to eliminate spring. Stringers and cross girts of 8in. x 6in. selected oak, braced through-going tie rods and substantial corner brackets. Stringers are iron banded to prevent wear.

## Running Gear

All steel. Double axles under each log seat. Bearing surfaces everywhere much larger than is the usual practice. Adjustment to take up wear provides means of quick re-alignment.

## Head Blocks

Cast of toughest steel throughout. Log seats of double girder section with wide heavy nigger nose, braced internally and steel faced with reversible lining plates. Knees high and of new design, are steel faced, provided with nigger hook and spring cushioned, self aligning taper movement of 6in.

## Racks and Pinions

Cut from the solid steel with deep involute tooth. Extra wide with the pinion split and adjusted to overcome back lash.

## Dogs

These carriages are provided with Waterous Inserted Tooth Dog, latest and most common sense dog on the market. Damaged teeth can be withdrawn and replaced without disturbing the dog in the knee. Designed to swing to draw the log against the knee tightly and firmly. Small logs, large logs and cants of all size handled equally well.

## Set Works

Our No. 4 Combination Set Works. A setter and receder in one machine. Cannot develop lost motion. We can prove this. New form of pawl. All operating parts of steel or wrought iron. The strongest, quickest acting, most exact set works yet produced.

# Lath Mill Machinery

---

All our Lath Mills are solidly built to stand the severest work.

We have made a special study of Lath Mill Machinery for many years, the result being that we can furnish machines correctly designed, each size of mill being designed specially for a certain capacity, and having the weight placed properly—where it is of some value to the machine.

Our catalogue shows machines ranging from a capacity of 20,000 lath up to 100,000 lath per day for a single machine.

*JUST AT PRESENT WE HAVE A LARGE STOCK OF LATH MACHINERY  
ON HAND, AND IF YOU REQUIRE ANYTHING OF THIS NATURE, THIS  
IS YOUR OPPORTUNITY TO GET PROMPT SHIPMENT. :: :: ::*

We are now making the Covell Patent Automatic Saw Swage and Shaper. Write about it.

# You Give Away Real Dollars When You Hold Back Orders

Our uniform grades and prompt shipments mean satisfied and profitable customers to you.

Poor lumber is dear almost at any price. It means worry and loss of time and friends. Those who make the most profit insist on buying and having delivered only standard, consistent grades.

This is the only kind of lumber we handle and right now we are prepared to accept contracts from 1912 sawing for delivery next summer, so get your requirements placed early. Don't overlook the fact that we leave the **Clear and Fine Dressing** in our Mill-Run, Quebec Spruce.

With the spring season invariably comes a greater demand for lumber. This means that the dealers' supply becomes taxed to the utmost and—prices jump.

## QUEBEC SPRUCE

should be ordered **now**, before the busy season really begins.

We supply you with choice mill-run stock, 1" x 4", 1" x 5", 1" x 6", in full or mixed carload lots; rough, dressed or re-sawed, as desired, and remember that we leave the clear and fine dressing in our Mill-Run Spruce.

**WHITE PINE**—We have it. Well watered factory stock in 1", 1½", and 2" strips, shorts and sidings; etc.

**HEMLOCK**—A nice dry stock of 1" sidings on hand. Will make a low price on No. 1 and No. 2 to clear them out.

# 440 Square Miles Timber Limits

on Georgian Bay

to be Sold by Private Sale in Large or Small Blocks.

On account of their President and Principal shareholders being engaged in other large enterprises, and not having the time to give to them all, THE PARRY SOUND LUMBER COMPANY, Limited, offer for Sale all of the timber lands, mills and town property situated in the Town of Parry Sound; also Tug Scow and full Camp Equipment for five camps, including boom chains, snow plows, sleighs, etc.

## THE LIMITS TO BE SOLD

comprise some 440 square miles of licensed and deeded Pine, Hemlock, Spruce, Birch and other timber. The licenses from the Ontario Government include all timbers and are not restricted for time. Government dues are as follows: Saw Logs, White Pine, \$1.50 per M. ft., B.M. Saw Logs, Hemlock, Tamarac and other woods 75c. per M. ft. The timber is situated in the Townships of McDougall, Foley, McKellar, Monteith, Carling, Christie, Shawanaga, Burpee, McConkey, Mills, Allen, Secord, Falconbridge and Street. The Canadian Pacific, Canadian Northern and Grand Trunk Railways run through the limits, which makes some of the parcels offered for sale particularly desirable for small mill owners.

A circular giving full information, maps, terms and conditions of sale will be furnished upon application to

# How This Rubber Belting Cuts Production Cost

Don't let slipping belts waste power—drain away profits. Plug up the leaks—save time, money, *power*, by investigating—installing Goodyear Rubber Belting.

Goodyear Rubber Belting stands for *saved energy*—**economy**. Built up of plies of rubberized fabric, cured and vulcanized into the solid piece. Neither slips nor stretches. Has the cohesiveness of rubber with the enduring strength of a specially woven cotton duck fabric from which all stretch has been taken out. It is steam, water, weather and rot proof.

The same high grade materials, the same skillful workmanship and the same years of experience that have built such famous service into the products of the Goodyear Tire & Rubber Co., U.S.A., is doing the same for Goodyear Rubber Belting and our many other rubber products.

## **GOOD** **YEAR** Rubber Belting

### **High Efficiency Belting**

Every size for every purpose—1 inch to 60 inches wide—2 plies to 8 plies thick.

### **Goodyear Quality Belting**

The highest grade made. Heaviest duck, best rubber, seamless, tough, durable. The saving main-drive belt for **Paper, Pulp** and **Lumber Mills**—for *all* mills where the horse-power transmitted is large and the demand for tensile strength is great.

### **Black Diamond Belting**

Lighter in weight, lower in price than above, but same in *quality*. Great quantities sold to **Sawmill** trade. Hundreds of mill owners say it gives better service than any other belt ever used.

### **Red Cross Belting**

The ideal belt for **Thresher, Small Sawmill** and **Flour Mill** use. Built to meet competition, yet is far superior to all other third-

grade belts because made of tougher rubber, heavier fabric (which means better friction) and better wearing service and cover.

### **Stitched Rubber Belting**

We make this belting in **Quality, Black Diamond** and **Red Cross** weights for those preferring this type of belting.

### **Elevator Belts**

We make a specialty of **Elevator Belts**. Our Leg and Lifter Belts used in hundreds of elevators. Give superior service because of greater strength. Buckets never pull out. Plies never separate. Long efficient service guaranteed.

### **Conveyor Belts**

For conveying crushed stone, grain, coal, ore, etc. Made in all thicknesses of face to suit requirements. Great toughness of rubber face prevents cutting and chipping; insures longest service.

## IMPERIAL HIGH-SPEED FRICTION SURFACE BELT

Specially designed for planer, dynamo, generator or fan work where pulleys are small and high-speeded. If we haven't what you want in stock, we'll *make it*—and *remember*

Goodyear Rubber Belts quickly earn their cost in pains and power saved—yet they cost less than the common kind. Let our expert solve your problem. Send requirements or write for catalog to-night.

Our sales of the last four months 50% greater than those of last year. Defective goods returned only \$23.93.

## TERMS OF SUBSCRIPTION:

Canada, United States and Great Britain, \$2.00 per year in advance; other foreign countries embraced in the General Postal Union, \$3.00.  
Single copies 15 cents.

"The Canada Lumberman and Woodworker" is published in the interest of, and reaches regularly, persons engaged in the lumber, woodworking and allied industries in every part of Canada. It aims at giving full and timely information on all subjects touching these interests, and invites free discussion by its readers.

Special care is taken to secure for publication the latest and most trustworthy market quotations throughout the world, so as to afford to the trade at home and abroad information on which it can rely in its operations.

Advertisers will receive careful attention and liberal treatment. For manufacturing and supply firms wishing to bring their goods to the attention of owners and operators of saw and planing mills, woodworking factories, pulp mills, etc., "The Canada Lumberman and Woodworker" is undoubtedly the most direct and profitable advertising medium. Special attention is directed to the "Wanted" and "For Sale" advertisements.

No. 6

## U. S. Lumber Market Conditions

A decline in prices of lumber during the last three months of 1911, was general in the United States according to the quarterly record of wholesale prices of lumber, published by the Forest Service. The prices which the government secures are based on actual sales made f.o.b. each market. In an introductory summary the report says:

In general, lumber prices for the last three months of 1911 show declines under prices for the first three quarters. Yellow pine prices were practically unchanged throughout the year, except in planking and dimension sizes, the prices of which are higher for the last quarter by \$1 to \$3 in Boston, New York, Philadelphia, Pittsburg, and Jacksonville. White pine was higher in Buffalo and Pittsburg during the last three months of the year by \$1 to \$3, while in Chicago and Minneapolis it was lower by \$1 to \$2. North Carolina pine prices held closely to one general average throughout the year. West Virginia spruce for the fourth quarter was higher by 50 cents in Pittsburg and \$1.50 to \$3 in New York than during the previous quarters of the year, and Eastern spruce in the Boston market was higher by about \$1.

Douglas fir generally sold at lower prices throughout the last six months of the year. In Minneapolis, prices for this wood declined \$1 to \$3 for this period, and in Kansas City, \$1 to \$1.50, while in Denver and Salt Lake City they were lower by \$1.50 to \$3. In California markets, Los Angeles and San Francisco, Douglas fir prices held well throughout the year, there being no marked decline for the last quarter, but in Portland and Seattle there was a definite decline amounting to 50 cents to \$2 for the last half of the year. In San Francisco redwood items sold at about \$1 lower for the last quarter than during the preceding three quarters.

In hardwoods, comparisons show many variations, October-November-December prices being generally lower. In Memphis, ash

FAS fell off by \$2 from prices obtained during the first half of the year, and cottonwood boxboards sold at \$4 less in the fourth quarter than in the first. In New Orleans, plain red oak FAS and No. 1 common sold by \$3.75 and \$3 lower than in the first quarter. Hardwood prices in Northern markets, on the other hand, while a trifle lower during the fourth quarter, held well with the prices of the first nine months of the year.

Throughout 1911, eastern softwoods held fairly firm, but western softwoods sold for lower prices in most markets during the last half of the year. Comparing 1910 and 1911, eastern softwood prices held firm through both years, but western red cedar and Douglas fir sold much lower and redwood somewhat lower in 1911 than in 1910.

Hardwood prices in 1910 declined in the second and third quarters and advanced somewhat in the last quarter. This advance continued into the first quarter of 1911, and most of the hardwoods have held fairly firm throughout the year. It is noticeable that ash, basswood and oak, both red and white, brought lower prices in most markets in 1911 than in 1910. Maple, gum, and tupelo generally sold at higher prices.

## Trade Associations Here to Stay

During the last few months most of the important trade associations connected with the lumber business in Canada and the United States have held their annual meetings. As the years pass by and successive annual meetings are held, nothing is more increasingly apparent than the fact that the association movement has come to stay. It has proved its usefulness more conclusively than any other factor in the wonderful development which has characterized recent years.

In Canada, although the association movement is still young, it is wonderfully lusty and promises to develop even as strongly as it has in the United States. A number of active and indispensable associations have now been in existence for several years. A few of them, such as the Western Retail Lumbermen's Association number their ages in decades and the field of their activities is expanding annually. One of the youngest associations in Canada is the Sash and Door Manufacturers' Association of Ontario. Like most of the important associations, this one developed out of a series of meetings of a few of the prominent members of the trade. They found the benefits of these meetings so pronounced that the natural result of their gatherings was a decision to form an association. Since the date of the formation of the association their usefulness to the industry has increased rapidly.

The case of the Ontario Sash and Door Association is mentioned here because it is typical both of the successes and of the opposition which characterize the early years of association life and it provides encouragement for others who may be at present in doubt as to the wisdom of following the same road. When this association was first suggested there were many who opposed it and who really believed that it would be a menace to the industry. It has proved the reverse. By way of substantiating this assertion a few quotations may be cited from letters written by members to the secretary upon the general subject of the association work.

A large manufacturer expresses his views as follows: "We believe that all trade associations are valuable, where they honestly seek to acquaint members with the exact conditions under which they are operating. A frank discussion of matters of interest should promote increased intelligence as to costs, the extent of competition and what business is really desirable." This short statement of the situation practically sums up the position. It is the result of many years of experience in association work.

Another prominent and successful lumberman outlines the situation as follows: "The writer is a very strong believer in association work, as a great deal can be accomplished by co-operation. In December 1903 the writer organized the Lumbermen's Association of Western Nova Scotia, and the benefits which were obtained by the manufacturers from meetings, exchanging ideas, getting personally acquainted, etc., helped everyone, as it eliminated intense competition and we are able to work together and get more out of the

manufactured product. Through this organization we were able to go to the government at Halifax as a body of representative lumbermen and we succeeded in establishing the forest fire laws of Nova Scotia, which to-day are conceded to be the best in Canada or in the United States. If the lumbermen had never met again after this and had only accomplished this particular work, they were well repaid for their trouble and efforts."

One of the most prominent members of the Sash and Door Association of Ontario writing upon the same subject says: "I cannot see how friendliness and co-operation in this work can in any way hinder competition. There are a great many things of mutual benefit to all, which we can only secure by united effort and if we do not obtain them it is an injury to the trade. By agreeing upon a schedule of standard qualities, sizes, measurements, styles and prices, we are rendering our service more efficient to the trade."

These views of prominent men in the lumber business accentuate the claims of those who have been active in promoting the spread of the association idea. They are substantiated also by the vigorous growth of the movement and by the continual development of new movements in the same direction. To-day in Ontario another association is probably in the germ, in the gatherings of the hem-

lock manufacturers which take place every few months and at which the proposal to form an association has already been discussed seriously. The Canadian Lumbermen's Association which was formed a little over four years ago has just proved in its annual meeting that it is a force for great good to the whole lumber industry of Canada, and that its influence will increase rapidly. It promises, in fact, to become an influential mouthpiece for the whole industry. It has had remarkable success during its formative period and has recently reduced its annual fee by one half making it now \$25. This step is certain to result in a great increase in its membership and influence.

An off-shoot of the association idea is found in the lumbermen's clubs which are springing up in many parts of the United States. These clubs are an excellent feature of the business life of the members. The wonder is that they have not long ago developed in far greater numbers. A movement is now on foot in Toronto for the formation of a lumbermen's club. Other cities are likely to follow suit once the example has been set.

The association movement has apparently made good in Canada and will remain with us.

## The Muck-Raker and the Lumber Trade

Canadian lumbermen are not unfamiliar with the trials which have beset their fellows in the United States of late years in the direction of being branded by some of the public press as the promoters of a great nation-wide trust. Such charges are sometimes made even in Canada and we are able to appreciate in a small measure the feeling of the lumber manufacturers of the United States who have been fighting for a profit, against the allied forces of financial depression, overproduction and bloodthirsty competition. The charge of conducting a trust, so far as the lumber manufacturers of Canada are concerned, has been restricted largely to the few members of Parliament who see in it a fine opportunity for making themselves solid with the constituents in their ridings, which happen to be large consumers of lumber. Fortunately their attacks are pretty well understood by the people of the country at large and practically none of the mud which they sling sticks. It is otherwise in the United States and the industry to-day is suffering greatly in this regard. One of the principal accusers in the United States is a man by the name of Charles Edward Russell who secures publicity in the columns of sensational eastern publications. He has lately come out with a wonderful description of the lumber trust of the United States. He admits that the trust so-called, is not a trust in the ordinary sense of the term, but declares that for this reason it is all the more dangerous.

That the country discounts the sensational in journalism to some extent, even though it enjoys the sensation itself, is indicated by an article which was published recently in the Tacoma Daily Tribune. "The lumbermen of Canada," says the Tribune, "are petitioning Ottawa to raise duties on lumber manufactured by their fellow Hoo-Hoo south of the line. The lumbermen of this country declare that unless Uncle Sam is agreeable to keep up the duties on Canadian lumber and also give free coastwise tolls on vessels passing through Panama the woodsmen of the north will capture what is left of the American lumber market.

"They 'viewed with alarm' and 'denounced with indignation' the Taft reciprocity scheme with Canada. There seems to be little fraternal love, in a strictly business way, between the manufacturers of the two nations.

"Even when consideration is confined to this country, matters do not seem to be any better. The retail dealers declare that the manufacturers are trying to butt into their field and that many of them are of that despicable class, the mail order house. Lumber apparently got down to such a picayunish affair that the retailers denounce the parcels post as a possible means of invading their market by the wicked wholesalers.

"The wholesalers are setting up selling agencies so that the ne-

farious retailers shall not combine to make them cut each other's financial throats by underbidding among themselves. Mills are going or have gone into bankruptcy. Others are running at a loss. Wages are down to the last possible notch, as there are as many men out of employment as are engaged in the industry.

"Even in the West, where the lumber barons (or is it 'barrens'?) are supposed to have their habitat, any two by four paving company with a 'patent' work their sweet will with complaisant city councils (or commissions) and are able to make cities pay double the proper price for inferior pavement, while men that are 'richer than Rockefeller' (who, probably, wish they were) are kept in the chilly atmosphere of the anterooms, blowing on their fingers to keep them warm!

"There is no great industry in the country which is in a more disorganized condition than that of lumber at the present day. That being the case, and the evidences of it are everywhere, the national muckraking joker, one Charles Edward Russell, in a Hearst publication, denounces it as the greatest trust in the United States. He says the trust is all the worse because it isn't a trust and because its members have no organization and not having one don't even know that they belong to it. But, nevertheless, in some mysterious way, this 'octopus' exists.

"If Mr. Russell were suddenly discovered to have one leg marching south and another marching north, to be without a head and bodyless, how much of Mr. Russell would there be left to entitle him to recognition? Incidentally, how much is there of him now?"

All of which is reprinted here, for the purpose of reminding the lumbermen of Canada that the symptoms of sensational journalism are pretty well developed in Canada, as well as in the United States, and that the occasional charges made on the floor of the House of Commons, may be considered as something in the nature of a warning as to what may come about in this country one of these days, unless lumbermen benefit from the experiences of their fellows in the United States and persistently and gradually educate the public to a reasonable appreciation of their situation. Already the situation has developed into an unfair one and the lumber manufacturers find it a matter of the utmost difficulty to obtain justice whenever they have to ask for government action. The signs of the times are pointing to a day when they will not only have to fight for their rights but will be placed unfairly on the defensive by those whose unpatriotic interests require that the lumber manufacturers shall be sacrificed. The lumber interests in Canada are great enough to make their opinions effective at Ottawa if they could only be persuaded to act in unison. The time for such action is to-day. In the course of a few years it may be too late.

## Increasing Domestic Consumption of Pulpwood

Statistics of the production of pulpwood and manufactured pulp and paper in Canada, which were published in the "Canada Lumberman" of February 15th are of the greatest interest to all who are engaged in the paper and pulp industry. Not only is the paper industry of Canada keenly concerned in this statistical record of the progress of production, but the paper and pulp industries of the United States are even more vitally involved. To some of the producers in the North Eastern States the statistics afford a statement from which they can foresee their future with almost startling clearness.

The statistics are those of the year 1909 and 1910, it being as yet impossible for the Forestry Branch to secure statistics in further advance than this. On account of the increasing importance of the paper-making industry in Canada, it is to be hoped that those who are concerned will join with the Forestry Branch in an effort to make it possible to prepare the statistics for publication with considerably less delay than has been the case up to date. At the present time the paper-making industries of Canada and of the United States are more keenly interested in statistics than probably any other industry one could name off-hand. Conditions have been changing rapidly and the only way to form in advance a trustworthy idea of the way things may be expected to develop, is by careful analysis of every available source of information. The increasing scarcity of spruce in the Northern States and the closing off of the supply from the Crown Lands in most of the provinces of Canada are two important factors at the present time.

So far as the statistics show, exports of pulpwood increased slightly during 1911 both in quantity and in the relative percentage to the total production. The production of 1910 amounted to 1,541,628 cords, and that of 1909 was 1,537,762 cords. The exports in 1910 amounted to 943,141 cords or 61.2 per cent. of the total. In 1909 the exports amounted to 915,633 cords or 59.5 per cent. of the total.

The figures illustrate clearly that during these two years Canada was exporting far more pulpwood than she was converting into wood pulp. The fact is one which must occupy our attention more closely than any other in connection with the pulpwood industry of the present day. It seems reasonable to expect that the rapidly increasing production of paper in Canada will result in a reversal of

these conditions, and that in the near future the quantity of pulpwood consumed in Canada will be considerably greater than the quantity which is exported. Natural conditions are now likely to bring about this result. Until the various provinces of Canada imposed a prohibition upon the export of pulpwood, such conditions could not have been fostered. By prohibiting the export of pulpwood cut from Crown Lands, the erection of pulp and paper mills in Canada was encouraged and the last year or two has seen enormous developments in this direction. These mills must of necessity consume large quantities of pulpwood and those who are closely in touch with the situation feel convinced that statistics for the years 1910-11 and 1911-12 will show that the mills of the Northern States have been seriously deprived of one of their principal sources of raw material.

Many other interesting features are to be noted in the statistics referred to. One of these is the increasing popularity of balsam as a pulpwood. In 1908, balsam was reported to have formed 12 per cent. of the total. In 1909 it formed 16 per cent. and in 1910, 20 per cent. of the total. Another interesting feature is the relative development of the mechanical and the sulphite processes. Pulpwood used in the mechanical processes in Canada during 1910 amounted to 388,561 cords. During the same time Canada consumed 192,857 cords of wood for the manufacture of sulphite pulp. The soda process during 1910 was responsible for the consumption of 17,069 cords in Canada.

The report makes the interesting statement that if the pulpwood exported in 1910 had been reduced to pulp in Canada it would have supplied 80 mills of the average size of those operating in Canada to-day. The total number of mills would then have been 131 instead of 51. Some day it is to be hoped that we will have in Canada a sufficient number of mills to take care of the greater part of our output of pulpwood. During the last year wonderful progress has been made in the erection of pulp and paper mills and the year which is to come promises to eclipse this record. In the meantime however, the United States presents a most convenient market for our surplus wood and it is probable that much of this surplus will continue to be exported until the day comes when we can utilize it in our own pulp and paper mills.

## Editorial Short Lengths for Busy Readers

Instructions are about to be issued by the Customs Board at Ottawa prohibiting the importation of United States shingles marked as of Canadian manufacture. This action is believed to have been taken largely as a result of the representations made by Hugh Davidson and A. Cotton, who represented the manufacturers at the meeting of the Canadian Lumber Manufacturers' Association.

While commenting upon the proposed provincial timber legislation, Mr. G. F. Gibson, connected with the timber department of the Dominion Trust Company, Vancouver, expressed the opinion that means should be adopted to safeguard the public against misleading reports of timber cruisers, many of whom, he declared, possessed no qualifications. Mr. Gibson emphasized the truth of his statement by producing a map showing the location of some timber on a river in the interior, with the cruisers' report to the effect that the river was driveable—a statement which was afterwards proven to have been absolutely incorrect.

One hears from time to time, serious complaints from employees in lumber camps that they do not receive proper medical care in return for the money which, as a rule, is deducted from their wages to cover such attention. Opinions vary greatly upon the subject and there are no doubt many camps in which the owners, realizing the advantage of proper medical care for the men, do all that lies in

their power to provide the best attention that the circumstances permit. Nevertheless those who are interested in the lumber business will be interested in a bill which has been introduced in the Ontario Legislature by Mr. A. E. Donovan which is entitled a bill to amend the Charity Aid Act. While a little aside from the subject of medical aid in lumber camps the bill touches the matter at one point and in the course of the discussion upon the bill Mr. Donovan dealt with the methods in existence for the care of lumber camp employees when they were in need of medical attention.

In some cases, he declared, physicians would be retained to care for the health of perhaps one thousand men in lumber camps, who were each compelled to contribute \$1 a month for the service, whether needing it or not. Doctors thus engaged had farmed out the jobs to other medical practitioners at, say 75 cents per man on the payroll. These concessions would be refarmed at 50 cents, or, Mr. Donovan had heard, down to 25 cents per head, per month.

The purport of Mr. Donovan's bill was to force municipalities to pay the actual cost of caring for sick or injured persons who are unable or unwilling to pay their own bills in hospitals, which receive grants from the Government.

Mr. Donovan's statement reflects seriously upon the management of camps in Ontario and it would be the part of wisdom among those who conduct lumber camps to furnish the Government with a statement of the actual conditions prevailing so that an effective remedy may be provided, or the charge disposed.

## British Columbia's Forest Wealth

Interesting Address by Hon. Price Ellison in Introducing His Budget—Optimistic Outlook for Lumber and Pulp

Hon. Price Ellison delivered his budget speech in the British Columbia Legislature on February 24th. Referring to the condition of the lumber industry and the lumber trade, he stated that they both showed very satisfactory returns for the year 1911. In the course of the speech he said: "I ventured to predict in my last budget speech that 1911 would prove a prosperous year in the lumber trade. My forecast was correct. The steadiness of the lumber market enabled the mills to operate during the entire year though some of those in the interior curtailed their output during November and December, on account of the American mills dumping their surplus cut on the markets of the northwest at less than cost price."

"According to the returns made to the chief timber inspector the lumber cut for 1911 was as follows:

"Logs officially scaled west of Coast range 619,000,000 feet; cut from Esquimalt & Nanaimo railway lands, 144,000,000 feet; logs officially scaled east of Coast range 297,000,000 feet; total, 1,060,000,000 feet.

"Of this amount the total manufactured into lumber was 1,013,000,000 feet, and the total exported 47,000,000 feet.

"The royalty collections for 1911 exceeded those of 1910 by no less than \$50,734.

"The causes of this better return may be summed up as follows:

"1. The crops in the prairie provinces compared favorably with those of 1910.

"2. The record number of incoming settlers increased the demand for dwelling and other houses.

"3. The checks on the dumping from the United States effected by the enforcement of the customs regulations by the new government at Ottawa will prevent the importation of other than real rough lumber.

"4. The lesson taught by the prolonged shutting down of mills in the United States has produced a lasting effect.

"I look forward therefore, to a still greater stimulus in the lumber trade in 1912—especially as there will be a larger amount demanded provincially owing to our development.

### Possibility of Pulp Industry

"The supply of pulpwood in the eastern United States has been hopelessly insufficient for the present needs of their people, and they already import one-quarter of the whole of the raw material for their paper mills from Canada. We are also exporting to them \$4,000,000 worth of manufactured pulp for the paper mills of the eastern states.

"I look forward to a rapid growth in that industry. I may add that the completion of the Panama canal in 18 months time cannot but have enormous influence in the development of our lumber trade. It can hardly fail in fact to become by far the most profitable of our staple industries. The cheaper freight rates, which will necessarily accompany the opening of the canal, must give an unprecedented stimulus, and will at the same time prevent a recurrence of periods of depression. With an easy means of communication secured to us by water as well as by land the depletion of the world's timber in other regions cannot fail to make the timber output of our forest lands a most permanent source of revenue for generations to come.

"This province more than two years ago outstripped Quebec in the production of lumber, while in 1910 her output was on a par with that of Ontario. It does not require the eye of a prophet to see that, with a vast proportion of her virgin forests still untouched she will, in proportion to her size take a prominent place within a year or two among the great timber producing countries in the world.

"In order to bring about this end and to encourage the establishment of the paper making industry in the province the government granted in 1901, 21 year leases of pulp wood forests to companies on liberal terms. In 1903 the law granting pulp leases was repealed. The annual rental now paid under these leases, is two cents per acre and a royalty of 25 cents per cord of pulp wood cut. Four companies are now either erecting or operating plants, the British Canadian Wood Pulp & Paper Co., the Swanson Bay Forests Wood Pulp & Lumber Mills, the Ocean Falls Co., Bella Coola and the Powell River Paper Co. As a proof of the prosperity of the industry the last named company is filled up with orders for all the paper and pulp it can produce.

"I believe that the mills of Powell River, Swanson Bay, Howe Sound and those of the British Columbia Wood Pulp & Paper Co., vast as they are, are but the pioneers of an enterprise which will fling its tentacles all over the world.

"Looking forward into the centuries, one can imagine a time when the great forests of this province will be denuded of most of

their timber; but even then, if all the wealth were gone, British Columbia would remain the greatest producing region in the world. No country shares with us our climate or our soil. It is the most congenial for the cottonwood, spruce, balsam, hemlock, and Lombard poplar, which produce the best paper. Already our ships are conveying the output of our forests in pulp and paper to Australia, New Zealand and the orient, and no far sighted man can doubt that in the near future half of the whole world will be the market place of the pulp and paper produce of British Columbia.

"We have in this province a combination of the three factors which together insure the prosperity of the pulp and paper trade—factors without which the industry can nowhere be successfully maintained. These three factors are (1) cheap water power; (2) cheap timber; (3) cheap transportation in close juxtaposition. Washington, Oregon and California have the last two but they lack that most essential factor—cheap water power. My conviction is therefore, that we can always compete successfully against other producing countries in capturing the pulp trade."

### Railway Found Responsible for Fire

A Nelson, B.C., despatch reports that a verdict has been given for the plaintiffs in the case in which the King Lumber Mills, Limited, claimed \$140,000 damages for fire on their limits near Yahk. The jury finds that the blaze originated on the railway right-of-way, but whether caused by a locomotive it is unable to decide. It also declines to say whether the railway had the proper appliances to prevent the escape of fire from locomotives, but it decides that the railway was negligent in failing to maintain a clear right-of-way, and in failing to properly attend to the fire when reported by its employees. It also finds that the railway did not take reasonable precautions to prevent the fire spreading. The amount of damages to be paid to the plaintiffs has yet to be decided by the Supreme Court judge.

### Wood Pulp Resources of Ontario

The extensive wood pulp resources of western Ontario, or rather northwestern Ontario, are described by a correspondent of "The Paper Mill," in the following interesting article:

Western Ontario is a district which, at present, merits the attention of all manufacturers of wood pulp. It is destined to become, within a few years, as important as the States of Wisconsin and Minnesota.

Recent examinations have shown that the whole country is well watered, and that in each of the larger river valleys there are large tracts of spruce, balsam and jack pine forest which have escaped fire.

There is, at present, only one pulp manufacturing company west of Sault Ste. Marie. This is the Dryden Timber and Power Company, situated on Wabigoon Lake, west of Fort William. A pulp and paper mill costing \$400,000 is now being completed. A steel and concrete pulp mill covering 50,000 square feet is now erected. The chemical recovery room is 130 feet by 80 feet. The screen room is 90 feet by 50 feet, the tank room 140 feet by 50 feet and the main paper machine room 210 feet by 60 feet. The mill will use 20,000 cords of wood yearly, cut from the limits of the company, and will have a pay roll of \$400,000 yearly for the employees of the pulp, paper and saw mills.

The mill at Dryden will be operated by electricity supplied by a fall of about 5,000 horse power which is leased from the Provincial Government for a term of twenty years, upon an annual payment of \$10 for the first two years and an annual payment of \$1,000 per year for each year thereafter. About 2,000 horse power are developed at present.

There are sites in the country north of Lake Superior for two score of mills similar to that at Dryden, provided that a market can be found for their output.

Though the region is heavily forested, the pulp wood industry will be more important than the saw mill industry. In ten years the white and red pine of the Rainy River region will be exhausted. Then nothing except pulp wood will remain. The whole region is well watered. Every large river valley carries enough timber to run a large mill indefinitely. On every river there are waterfalls to supply the power, and at the head of every river are lakes which will act as reservoirs and maintain the flow of water. Adequate transportation will be provided by the three transcontinental lines of railway which will cross the country in two years.

A few districts which are worth investigating are noted here.

Michipicoten Harbor. At this point, a short distance north of Sault Ste. Marie, 17,000 horse power are available at the mouths of the Magpie and Michipicoten rivers. Pulp wood may be driven down the valleys of the two rivers mentioned, or may be towed to the harbor from various nearby points on the lake.

Nepigon River. This river affords great possibilities for the pulp manufacturers. The Nepigon River drains Nepigon Lake, a

lake of 1,000 square miles surrounded by a watershed heavily forested with spruce and jack pine. The power available on Nepigon River reaches 78,000 horse power. The C.P.R., C.N.R. and G.T.P. transcontinental lines traverse the watershed of the Nepigon River.

Seine River. This river crosses the line of the C.N.R. between Fort William and Fort Frances. It drains a heavily forested territory covered with a network of lakes and waterways. At one point on the Seine, near the railroad, 7,500 horse power are available. There is a vast quantity of timber available to this fall.

Fort Frances. This town is certain to become a pulp centre. East, west and north from it numerous waterways stretch into a forested country. At Fort Frances 14,000 horse power can be developed on the Canadian side of the Rainy River. The Canadian Northern Railway runs from here south to the States, west to the prairies and east to Ontario. It is understood that the construction of a mill is to be started in the spring.

Kenora. The Winnipeg River, at Kenora on the Lake of the Woods, offers great possibilities. There are available over 19,000 horse power, of which only 6,300 horse power are developed. The whole Rainy and Lake of the Woods watershed—several thousand square miles—is available as a source of wood, and Kenora is on the main line of the Canadian Pacific Railway, 200 miles from the prairie market.

On the Grand Trunk Pacific are many prospects.

Pelican Chute, near Lake Superior Junction, will furnish 3,500 horse power on a river which drains a large area of spruce.

Further east, in the densely forested headwaters of the Kenogami River, where are thousands of square miles of the heaviest spruce, balsam and poplar in Ontario, are twelve water powers aggregating 99,000 horse power under discharge control.

In addition to the above most striking propositions awaiting development, a close examination of the territory would reveal many more.

### The Government's Plan for Settling Northern Ontario

An old settler by the name of Fred Mullett, living at Bancroft, Ont., criticizes the proposal of the Ontario Government to provide houses and clearings for settlers in Northern Ontario. In a letter to the Toronto Star he says in part:

"I do not mean to say that Government assistance could not be profitably given, but it would have to be in a different form from that which I have seen proposed. Permit me to very briefly outline my views in this matter, it being understood that space will not permit more than an imperfect explanation.

"The first and most important rule to be observed would be to prohibit the settling of land that was not suited for agricultural purposes. Many thousands of acres have been cleared in Muskoka, Haliburton, and Hastings that are now abandoned, and in many instances large and expensive buildings have been erected on farms that became worthless after the first few crops had been taken off.

"Instead of clearing land and building houses and barns on the lands granted to the settlers, it should be understood that the Government would, in case of necessity, make advances of, say, half the nominal value of the improvements made by the settler, the interest being the very lowest amount at which the money could be procured by the Government.

"Strict regulations as to the prevention of bush fires should be enforced, not only on the settlers, but on the railways and lumbermen.

"If the authorities would take off from the timber dues the one dollar a thousand feet that it would cost to burn the debris caused by lumbering operations, we would hear very much less about settlers' fires, and if effective screens were kept on the smoke stacks of locomotives in dry times, many disastrous fires would be prevented.

The construction of towns in the Porcupine mining region has created a great demand for lumber and large supplies have gone in from the mills in northern Ontario, the price being greatly increased by transportation difficulties. A year ago as high as \$65 a thousand feet was paid for lumber brought from a distance. The camp is now supplied by four local mills, two of them operated by Timmins Bros., near the Mattagami River; one by Joy Bros., at South Porcupine; and one by Golden City parties on the banks of Shallow Lake. The principal woods available in the neighborhood are small jack pine, spruce and tamarack. As the timber can be taken only where the title to the land has been granted by the Government it is being petitioned to allow the cutting of timber on public lands where there is danger that it will be destroyed by fire.

A Vancouver report says that last year's output of lumber from the mills of the interior or mountain district of British Columbia is
